2. Install duct mounted manual volume dampers at each duct branch, riser take off, tap, air device, grille, diffuser, register, equipment/device connection, open ended duct, etc.

E. Set dampers to fully open position before testing, adjusting, and balancing.

F. Install test holes at fan inlets and outlets and elsewhere as indicated.

G. Install duct access doors on sides of ducts to allow for inspecting, adjusting, and maintaining accessories and equipment at the following locations:

1. On both sides of duct coils.

2. At outdoor-air intakes and mixed-air plenums.

3. At drain pans and seals.

4. Downstream from manual volume dampers, control dampers, backdraft dampers, and equipment.

5. Adjacent to and close enough to fire dampers, to reset or reinstall fusible links. Access doors for access to fire dampers having fusible links shall be pressure relief access doors and shall be outward operation for access doors installed upstream from dampers and inward operation for access doors installed downstream from dampers.

6. At each change in direction and at maximum 50-foot (15-m) spacing.

7. Upstream and downstream from turning vanes.

8. Control devices requiring inspection.

9. Elsewhere as indicated.

H. Install access doors with swing against duct static pressure.

I. Access Door Sizes:

1. One-Hand or Inspection Access: 8 by 5 inches (200 by 125 mm).

2. Two-Hand Access: 12 by 6 inches (300 by 150 mm).

3. Head and Hand Access: 18 by 10 inches (460 by 250 mm).

4. Head and Shoulders Access: 21 by 14 inches (530 by 355 mm).

5. Body Access: 25 by 14 inches (635 by 355 mm).

6. Body plus Ladder Access: 25 by 17 inches (635 by 430 mm).

J. Label access doors according to Division 23 Section "Identification for HVAC Piping and Equipment" to indicate the purpose of access door.

K. Install flexible connectors to connect ducts to equipment.

L. For fans developing static pressures of 5-inch wg. (1250 Pa) and more, cover flexible connectors with loaded vinyl sheet held in place with metal straps.

M. Connect flexible ducts to metal ducts with adhesive plus sheet metal screws.

N. Install duct test holes where required for testing and balancing purposes.

O. Where two units are tied to one supply duct, install gravity back draft dampers to protect back feeding in case one unit is not working.

3.2 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. Operate dampers to verify full range of movement.

2. Inspect locations of access doors and verify that purpose of access door can be performed.

3. Inspect turning vanes for proper and secure installation.

4. Operate remote damper operators to verify full range of movement of operator and damper.

END OF SECTION 23 33 00

SECTION 23 34 16 - CENTRIFUGAL HVAC FANS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes: For each
   1. Backward-inclined centrifugal fans.

B. Related Requirements:
   1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
   2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 ACTION SUBMITTALS

A. Product Data:

   1. Include rated capacities, furnished specialties, and accessories for each fan.
   2. Certified fan performance curves with system operating conditions indicated.
   3. Certified fan sound-power ratings.
   4. Motor ratings and electrical characteristics, plus motor and electrical accessories.
   5. Material thickness and finishes, including color charts.

B. Shop Drawings:

   1. Include plans, elevations, sections, and attachment details.
   2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   3. Include diagrams for power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Show fan room layout and relationships between components and adjacent structural and mechanical elements. Show support locations, type of support, and weight on each support. Indicate and certify field measurements.

B. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For centrifugal fans to include in emergency, operation, and maintenance manuals.

1.6 MAINTENANCE SPARE PARTS

A. Belts: Two sets for each belt-driven unit.

B. Other spare parts: Manufacturer's recommended quantity, but not less than 10% of all replacement parts, with a minimum quantity of one each.

1.7 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of centrifugal fans that fail in materials or workmanship for not less than a period of two years.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. AMCA Compliance:

1. Comply with AMCA performance requirements and bear the AMCA-Certified Ratings Seal.
2. Operating Limits: Classify according to AMCA 99.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.2 BACKWARD-INCLINED CENTRIFUGAL FANS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Greenheck Fan Corporation.
2. Howden Buffalo Inc.
3. Howden Buffalo Inc.; New Philadelphia Division.
4. Loren Cook Company

B. Description:

1. Factory-fabricated, -assembled, -tested, and -finished, belt-driven centrifugal fans consisting of housing, wheel, fan shaft, bearings, motor, drive assembly, and support structure.
2. Deliver fans as factory-assembled units, to the extent allowable by shipping limitations.
3. Factory-installed and -wired disconnect switch.
4. Variable Frequency Drive capability.

C. Housings:

1. Formed panels to make curved-scroll housings with shaped cutoff.
2. Panel Bracing: Steel angle- or channel-iron member supports for mounting and supporting fan scroll, wheel, motor, and accessories.
3. Horizontally split, bolted-flange housing.
4. Spun inlet cone with flange.
5. Outlet flange.

D. Backward-Inclined Wheels:

1. Single-width-single-inlet and double-width-double-inlet construction with curved inlet flange, backplate, backward-inclined blades, and fastened to shaft with set screws.
2. Welded or riveted to flange and backplate; cast-iron or cast-steel hub riveted to backplate.

E. Shafts:

1. Statically and dynamically balanced and selected for continuous operation at maximum rated fan speed and motor horsepower, with adjustable alignment and belt tensioning.
2. Turned, ground, and polished hot-rolled steel with keyway. Ship with protective coating of lubricating oil.
3. Designed to operate at no more than 70 percent of first critical speed at top of fan's speed range.

F. Prelubricated and Sealed Shaft Bearings:

1. Self-aligning, pillow-block-type ball bearings.
2. Ball-Bearing Rating Life: ABMA 9, Ll0 at 100,000.
3. Roller-Bearing Rating Life: ABMA 11, Ll0 at 100,000.

G. Belt Drives:

1. Factory mounted, with adjustable alignment and belt tensioning.
2. Service Factor Based on Fan Motor Size: 1.5.
3. Fan Pulleys: Cast iron or cast steel with split, tapered bushing; dynamically balanced at factory.
4. Motor Pulleys: Adjustable pitch for use with motors through 5 hp; fixed pitch for use with larger motors. Select pulley so pitch adjustment is at the middle of adjustment range at fan design conditions.
5. Belts: Oil resistant, nonsparking, and nonstatic; matched sets for multiple belt drives.
6. Belt Guards: Fabricate to comply with OSHA and SMACNA requirements of diamond-mesh wire screen welded to steel angle frame or equivalent, prime coated. Secure to fan or fan supports without short circuiting vibration isolation. Include provisions for adjustment of belt tension, lubrication, and use of tachometer with guard in place.
7. Motor Mount: Adjustable for belt tensioning.

H. Accessories:

1. Access for Inspection, Cleaning, and Maintenance: Comply with requirements in ASHRAE 62.1.
2. Companion Flanges: Rolled flanges for duct connections of same material as housing.
3. Shaft Cooler: Metal disk between bearings and fan wheel, designed to dissipate heat from shaft.
4. Shaft Seals: Airtight seals installed around shaft on drive side of single-width fans.

2.3 MOTORS

A. Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."

2.4 SOURCE QUALITY CONTROL

A. Sound-Power Level Ratings: Comply with AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data." Factory test fans according to AMCA 300, "Reverberant Room Method for Sound Testing of Fans." Label fans with the AMCA-Certified Ratings Seal.

B. Fan Performance Ratings: Establish flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests and ratings according to AMCA 210/ASHRAE 51, "Laboratory Methods of Testing Fans for Certified Aerodynamic Performance Rating."

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install centrifugal fans level and plumb.

B. Disassemble and reassemble units, as required for moving to the final location, according to manufacturer's written instructions.

C. Lift and support units with manufacturer's designated lifting or supporting points.

D. Equipment Mounting:

1. Install centrifugal fans on cast-in-place concrete equipment base(s). Comply with requirements for equipment bases and foundations specified in Section 033000 "Cast-in-Place Concrete."
2. Comply with requirements for vibration isolation and seismic control devices specified in Section 230548 "Vibration and Seismic Controls for HVAC."

E. Unit Support: Install centrifugal fans level on structural supports. Coordinate wall penetrations and flashing with wall construction. Secure units to structural support with anchor bolts.

F. Install units with clearances for service and maintenance.

G. Label fans according to requirements specified in Section 230553 "Identification for HVAC Piping and Equipment."

3.2 CONNECTIONS

A. Drawings indicate general arrangement of ducts and duct accessories. Make final duct connections with flexible connectors. Flexible connectors are specified in Section 233300 "Air Duct Accessories."

B. Install ducts adjacent to fans to allow service and maintenance.

C. Install piping from scroll drain connection, with trap with seal equal to 1.5 times specified static pressure, to nearest floor drain with pipe sizes matching the drain connection.

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Perform the following tests and inspections with the assistance of a factory-authorized service representative:

1. Verify that shipping, blocking, and bracing are removed.
2. Verify that unit is secure on mountings and supporting devices and that connections to ducts and electrical components are complete. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.
3. Verify that cleaning and adjusting are complete.
4. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system, align and adjust belts, and install belt guards.
5. Adjust belt tension.
6. Adjust damper linkages for proper damper operation.
7. Verify lubrication for bearings and other moving parts.
8. Verify that manual and automatic volume control and fire and smoke dampers in connected ductwork systems are in fully open position.
9. See Section 230593 "Testing, Adjusting, and Balancing For HVAC" for testing, adjusting, and balancing procedures.
10. Remove and replace malfunctioning units and retest as specified above.

C. Test and adjust controls and safeties. Controls and equipment will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

3.4 ADJUSTING

A. Adjust damper linkages for proper damper operation.

B. Adjust belt tension.

C. Lubricate bearing

END OF SECTION 233416

SECTION 23 34 23 - HVAC POWER VENTILATORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Utility set fans.
2. Centrifugal roof ventilators.
3. Ceiling-mounted ventilators.
4. In-line fans.
5. Louvered Roof Supply fans.

B. Related Requirements:
1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 PERFORMANCE REQUIREMENTS

A. Project Altitude: Base fan-performance ratings on sea level.

B. Operating Limits: Classify according to AMCA 99.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, and furnished specialties and accessories. Also include the following:

1. Certified fan performance curves with system operating conditions indicated.
2. Certified fan sound-power ratings.
3. Motor ratings and electrical characteristics, plus motor and electrical accessories.
4. Material thickness and finishes, including color charts.
5. Dampers, including housings, linkages, and operators.
6. Roof curbs.
7. Fan speed controllers.

B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.

1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

2. Wiring Diagrams: For power, signal, and control wiring.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Reflected ceiling plans and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from Installers of the items involved:

1. Roof framing and support members relative to duct penetrations.
2. Ceiling suspension assembly members.
3. Size and location of initial access modules for acoustical tile.
4. Ceiling-mounted items including light fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.

B. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For power ventilators to include in emergency, operation, and maintenance manuals.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Belts: Two sets for each belt-driven unit.

B. Other spare parts: Manufacturer's recommended quantity, but not less than 10% of all replacement parts, with a minimum quantity of one each.

1.8 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. AMCA Compliance: Fans shall have AMCA-Certified performance ratings and shall bear the AMCA-Certified Ratings Seal.

C. UL Standards: Power ventilators shall comply with UL 705. Power ventilators for use for kitchen exhaust shall also comply with UL 762.

1.9 COORDINATION

A. Coordinate size and location of structural-steel support members.

B. Coordinate sizes and locations of concrete bases with actual equipment provided.

C. Coordinate sizes and locations of roof curbs, equipment supports, and roof penetrations with actual equipment provided.

PART 2 - PRODUCTS

2.1 UTILITY SET FANS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Carnes Company HVAC.
   2. Hartzell Fan, Inc.
   3. Industrial Air; a division of Lau Industries, Inc.
   4. Loren Cook Company.
   5. New York Blower Company (The).
   6. Penn Ventilation.
   7. Greenheck Fan Corporation.

B. Housing: Fabricated of steel with side sheets fastened with a deep lock seam or welded to scroll sheets.

   1. Housing Discharge Arrangement: Adjustable to eight standard positions.

C. Fan Wheels: Single-width, single inlet; welded to cast-iron or cast-steel hub and spun-steel inlet cone, with hub keyed to shaft.

   1. Blade Materials: Steel.
   2. Blade Type: Forward curved.
   3. Spark-Resistant Construction: AMCA 99, Type A.

D. Fan Shaft: Turned, ground, and polished steel; keyed to wheel hub.

E. Shaft Bearings: Prelubricated and sealed, self-aligning, pillow-block-type ball bearings with ABMA 9, L_{50} of 200,000 hours.

   1. Extend grease fitting to accessible location outside of unit.

F. Belt Drives:

   1. Factory mounted, with final alignment and belt adjustment made after installation
   2. Service Factor Based on Fan Motor Size: 1.5.
   3. Motor Pulleys: Adjustable pitch for use with motors through 5 hp; fixed pitch for use with larger motors. Select pulley so pitch adjustment is at the middle of adjustment range at fan design conditions.
   4. Belts: Oil resistant, nonsparking, and nonstatic; matched sets for multiple belt drives.
   5. Belt Guards: Fabricate of steel for motors mounted on outside of fan cabinet.

G. Accessories:

   1. Inlet and Outlet: Flanged.
   2. Companion Flanges: Rolled flanges for duct connections of same material as housing.
   3. Backdraft Dampers: Gravity actuated with counterweight and interlocking aluminum blades with felt edges in steel frame installed on fan discharge.
   4. Access Door: Gasketed door in scroll with latch-type handles.
   5. Scroll Dampers: Single-blade damper installed at fan scroll top with adjustable linkage.
   6. Inlet Screens: Removable wire mesh.
   7. Drain Connections: NPS 3/4 threaded coupling drain connection installed at lowest point of housing.

8. Weather Hoods: Weather resistant with stamped vents over motor and drive compartment.
9. Discharge Dampers: Assembly with opposed blades constructed of two plates formed around and to shaft, channel frame, sealed ball bearings, with blades linked outside of airstream to single control lever of same material as housing.
10. Speed Controller: Solid-state control to reduce speed from 100 to less than 50 percent.

H. Capacities and Characteristics: As indicated on Drawings.

1. Vibration Isolators:

a. Type: Spring isolators.

2. Spark Arrestance Class: A.

2.2 CENTRIFUGAL ROOF VENTILATORS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Carnes Company HVAC.
2. Hartzell Fan, Inc.
3. Industrial Air; a division of Lau Industries, Inc.
4. Loren Cook Company.
5. New York Blower Company (The).
6. Penn Ventilation.
7. Greenheck Fan Corporation.

B. Housing: Removable, spun-aluminum, dome top and outlet baffle; square, one-piece, aluminum base with venturi inlet cone.

1. Upblast Units: Provide spun-aluminum discharge baffle to direct discharge air upward, with rain and snow drains and grease collector.
2. Hinged Subbase: Galvanized-steel hinged arrangement permitting service and maintenance.

C. Fan Wheels: Aluminum hub and wheel with backward-inclined blades.

D. Belt Drives:

1. Resiliently mounted to housing.
2. Fan Shaft: Turned, ground, and polished steel; keyed to wheel hub.
3. Shaft Bearings: Permanently lubricated, permanently sealed, self-aligning ball bearings.
4. Pulleys: Cast-iron, adjustable-pitch motor pulley.
5. Fan and motor isolated from exhaust airstream.

E. Accessories:

1. Variable-Speed Controller: Solid-state control to reduce speed from 100 to less than 50 percent.
2. Disconnect Switch: Nonfusible type, with thermal-overload protection mounted inside fan housing, factory wired through an internal aluminum conduit.
3. Bird Screens: Removable, 1/2-inch mesh, aluminum or brass wire.
4. Dampers: Counterbalanced, parallel-blade, backdraft dampers mounted in curb base; factory set to close when fan stops.

5. Motorized Dampers: Parallel-blade dampers mounted in curb base with electric actuator; wired to close when fan stops.

F. Roof Curbs: Galvanized steel; mitered and welded corners; 1-1/2-inch- thick, rigid, fiberglass insulation adhered to inside walls; and 1-1/2-inch wood nailer. Size as required to suit roof opening and fan base.

1. Configuration: Built-in cant and mounting flange.
2. Overall Height: 18 inches.
3. Sound Curb: Curb with sound-absorbing insulation.
4. Pitch Mounting: Manufacture curb for roof slope.
5. Metal Liner: Galvanized steel.
6. Burglar Bars: 1/2-inch- thick steel bars welded in place to form 6-inch squares.

G. Capacities and Characteristics: As indicated on drawings.

2.3 CEILING-MOUNTED VENTILATORS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Carnes Company HVAC.
2. Hartzell Fan, Inc.
3. Industrial Air; a division of Lau Industries, Inc.
4. Loren Cook Company.
5. New York Blower Company (The).
6. Penn Ventilation.
7. Greenheck Fan Corporation.

B. Housing: Steel, lined with acoustical insulation .

C. Fan Wheel: Centrifugal wheels directly mounted on motor shaft. Fan shrouds, motor, and fan wheel shall be removable for service.

D. Grille: Aluminum, louvered grille with flange on intake and thumbscrew attachment to fan housing.

E. Electrical Requirements: Junction box for electrical connection on housing and receptacle for motor plug-in.

F. Accessories:

1. Variable-Speed Controller: Solid-state control to reduce speed from 100 to less than 50 percent.
2. Manual Starter Switch: Single-pole rocker switch assembly with cover and pilot light.
3. Isolation: Rubber-in-shear vibration isolators.
4. Manufacturer's standard roof jack or wall cap, and transition fittings.

G. Capacities and Characteristics: As indicated on Drawings.

2.4 IN-LINE FANS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Carnes Company HVAC.
2. Hartzell Fan, Inc.
3. Industrial Air; a division of Lau Industries, Inc.
4. Loren Cook Company.
5. New York Blower Company (The).
6. Penn Ventilation.
7. Greenheck Fan Corporation.

B. Housing: Steel, lined with acoustical insulation with inlet and outlet flange for duct connections.

C. Fan Wheel: Centrifugal wheels directly mounted on motor shaft. Fan shrouds, motor, and fan wheel shall be removable for service.

D. Belt Drives:

1. Resiliently mounted to housing.
2. Fan Shaft: Turned, ground, and polished steel; keyed to wheel hub.
3. Shaft Bearings: Permanently lubricated, permanently sealed, self-aligning ball bearings.
4. Pulleys: Cast-iron, adjustable-pitch motor pulley.
5. Fan and motor isolated from exhaust airstream.

E. Motor: permanently lubricated

F. Electrical Requirements: Junction box for electrical connection on housing and receptacle for motor plug-in.

G. Accessories:

1. Variable-Speed Controller: Solid-state control to reduce speed from 100 to less than 50 percent.
2. Manual Starter Switch: Single-pole rocker switch assembly with cover and pilot light.
3. Isolation: Rubber-in-shear vibration isolators.
4. Manufacturer's standard roof jack or wall cap, and transition fittings.

H. Capacities and Characteristics: As indicated on Drawings.

2.5 LOUVERED ROOF SUPPLY FANS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Carnes Company HVAC.
2. Hartzell Fan, Inc.
3. Industrial Air; a division of Lau Industries, Inc.
4. Loren Cook Company.
5. New York Blower Company (The).
6. Penn Ventilation.
7. Greenheck Fan Corporation.

B. Hood: Louvered penthouse, extruded aluminum louvers, with insulated hinged aluminum cover.

C. Filter: Permanent 2 inch.

D. Fan Wheel: Flat blade, backward inclined, double width, double inlet centrifugal wheels, statically and dynamically balanced.

E. Fan Shaft: Turned, ground, and polished steel; keyed to wheel hub.

F. Shaft Bearings: Prelubricated and sealed, self-aligning, pillow-block-type ball bearings with ABMA 9, L_{50} of 200,000 hours.

G. Belt Drives:

1. Factory mounted, with final alignment and belt adjustment made after installation
2. Service Factor Based on Fan Motor Size: 1.5.
3. Motor Pulleys: Adjustable pitch for use with motors through 5 hp; fixed pitch for use with larger motors. Select pulley so pitch adjustment is at the middle of adjustment range at fan design conditions.
4. Belts: Oil resistant, nonsparking, and nonstatic; matched sets for multiple belt drives.

H. Accessories:

1. Variable-Speed Controller: Solid-state control to reduce speed from 100 to less than 50 percent.

I. Capacities and Characteristics: As indicated on Drawings.

2.6 MOTORS

A. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."

1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.

B. Enclosure Type: Totally enclosed, fan cooled.

2.7 SOURCE QUALITY CONTROL

A. Certify sound-power level ratings according to AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data." Factory test fans according to AMCA 300, "Reverberant Room Method for Sound Testing of Fans." Label fans with the AMCA-Certified Ratings Seal.

B. Certify fan performance ratings, including flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests according to AMCA 210, "Laboratory Methods of Testing Fans for Aerodynamic Performance Rating." Label fans with the AMCA-Certified Ratings Seal.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install power ventilators level and plumb.

B. Equipment Mounting:

1. Install power ventilators on cast-in-place concrete equipment base(s). Comply with requirements for equipment bases and foundations specified in Section 033000 "Cast-in-Place Concrete."
2. Comply with requirements for vibration isolation and seismic control devices specified in Section 230548 "Vibration and Seismic Controls for HVAC."

C. Secure roof-mounted fans to roof curbs with cadmium-plated hardware and vandal proof screws. See Section 077200 "Roof Accessories" for installation of roof curbs.

D. Ceiling Units: Suspend units from structure; use steel wire or metal straps.

E. Support suspended units from structure using threaded steel rods and elastomeric hangers having a static deflection of 1 inch . Vibration-control devices are specified in Section 230548 "Vibration and Seismic Controls for HVAC."

F. Install units with clearances for service and maintenance.

G. Label units according to requirements specified in Section 230553 "Identification for HVAC Piping and Equipment."

3.2 CONNECTIONS

A. Drawings indicate general arrangement of ducts and duct accessories. Make final duct connections with flexible connectors. Flexible connectors are specified in Section 233300 "Air Duct Accessories."

B. Install ducts adjacent to power ventilators to allow service and maintenance.

C. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."

D. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

3.3 FIELD QUALITY CONTROL

A. Perform tests and inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

B. Tests and Inspections:

1. Verify that shipping, blocking, and bracing are removed.
2. Verify that unit is secure on mountings and supporting devices and that connections to ducts and electrical components are complete. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.
3. Verify that cleaning and adjusting are complete.
4. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system, align and adjust belts, and install belt guards.
5. Adjust belt tension.

6. Adjust damper linkages for proper damper operation.
7. Verify lubrication for bearings and other moving parts.
8. Verify that manual and automatic volume control and fire dampers in connected ductwork systems are in fully open position.
9. Disable automatic temperature-control operators, energize motor and adjust fan to indicated rpm, and measure and record motor voltage and amperage.
10. Shut unit down and reconnect automatic temperature-control operators.
11. Remove and replace malfunctioning units and retest as specified above.

C. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

D. Prepare test and inspection reports.

3.4 ADJUSTING

A. Adjust damper linkages for proper damper operation.

B. Adjust belt tension.

C. Comply with requirements in Section 230593 "Testing, Adjusting, and Balancing for HVAC" for testing, adjusting, and balancing procedures.

D. Replace fan and motor pulleys as required to achieve design airflow.

E. Lubricate bearings.

3.5 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain HVAC power ventilators.

B. Refer Division 01 for administrative and procedural requirements for demonstration and training.

END OF SECTION 233423

SECTION 23 36 00 – AIR TERMINAL UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Shutoff, single-duct air terminal units.

B. Related Requirements:
   1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
   2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 SUBMITTALS

A. Product Data: For each type of the following products, including rated capacities, furnished specialties, sound-power ratings, and accessories.

   1. Air terminal units.
   2. Liners and adhesives.
   3. Sealants and gaskets.

B. Shop Drawings: For air terminal units. Include plans, elevations, sections, details, and attachments to other work.

   1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   2. Wiring Diagrams: For power, signal, and control wiring.
   3. Hangers and supports, including methods for duct and building attachment and vibration isolation.

C. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from Installers of the items involved:

   1. Ceiling suspension assembly members.
   2. Size and location of initial access modules for acoustic tile.
   3. Ceiling-mounted items including lighting fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.

D. Field quality-control reports.

E. Operation and Maintenance Data: For air terminal units to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include the following:

1. Instructions for resetting minimum and maximum air volumes.
2. Instructions for adjusting software set points.

1.4 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1-2004, Section 5 - "Systems and Equipment" and Section 7 - "Construction and System Start-Up."

1.5 MAINTENANCE SPARE PARTS

A. Spare parts: Manufacturer's recommended quantity, but not less than 10% of all replacement parts, with a minimum quantity of one each.

PART 2 - PRODUCTS

2.1 SHUTOFF, SINGLE-DUCT AIR TERMINAL UNITS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Carnes.
2. METALAIRE, Inc.
3. Titus.
4. Trane; a business of American Standard Companies.

B. Configuration: Volume-damper assembly inside unit casing with control components inside a protective metal shroud.

C. Casing: 0.034-inch (0.85-mm) steel, single wall.

1. Casing Lining: Adhesive attached, 1-inch- (25-mm-) thick, coated, fibrous-glass duct liner complying with ASTM C 1071, and having a maximum flame-spread index of 25 and a maximum smoke-developed index of 50, for both insulation and adhesive, when tested according to ASTM E 84.
2. Air Inlet: Round stub connection or S-slip and drive connections for duct attachment.
3. Air Outlet: S-slip and drive connections.
4. Access: Removable panels for access to parts requiring service, adjustment, or maintenance; with airtight gasket.
5. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1-2004.

D. Regulator Assembly: System-air-powered bellows section incorporating polypropylene bellows for volume regulation and thermostatic control. Bellows shall operate at temperatures from 0 to

140 deg F (minus 18 to plus 60 deg C), shall be impervious to moisture and fungus, shall be suitable for 10-inch wg (2500-Pa) static pressure, and shall be factory tested for leaks.

E. Volume Damper: Galvanized steel with peripheral gasket and self-lubricating bearings.

1. Maximum Damper Leakage: ARI 880 rated, 3 percent of nominal airflow at 3-inch wg (750-Pa) inlet static pressure.
2. Damper Position: Normally closed.

A. Electric-Resistance Heating Coils: Nickel-chromium heating wire, free of expansion noise and hum, mounted in ceramic inserts in a galvanized-steel housing; with primary automatic, and secondary manual, reset thermal cutouts. Terminate elements in stainless-steel, machine-staked terminals secured with stainless-steel hardware.
1. SCR controlled.
2. Access door interlocked disconnect switch.
3. Downstream air temperature sensor with local connection to override discharge-air temperature to not exceed a maximum temperature set point (adjustable).
4. Nickel chrome 80/20 heating elements.
5. Airflow switch for proof of airflow.
6. Fuses in terminal box for overcurrent protection (for coils more than 48 A).
7. Mercury contactors.
8. Pneumatic-electric switches and relays.
9. Magnetic contactor for each step of control (for three-phase coils).

B. Direct Digital Controls: Single-package unitary controller and actuator specified in Division 23 Section "Instrumentation and Control for HVAC."
1. Factory mount controls provided by controls contractor.
2. Electric Damper Actuator: 24 V, powered open, spring return.
3. Terminal Unit Controller: Pressure-independent, variable-air-volume (VAV) controller with electronic airflow transducer with multipoint velocity sensor at air inlet, factory calibrated to minimum and maximum air volumes, and having the following features:

a. Occupied and unoccupied operating mode.
b. Remote reset of airflow or temperature set points.
c. Adjusting and monitoring with portable terminal.
d. Communication with temperature-control system specified in Section 230900 "Direct Digital Control (DDC) System for HVAC.
e. Pressure switch.
f. Temperature sensor.

2.2 SOURCE QUALITY CONTROL

A. Factory Tests: Test assembled air terminal units according to ARI 880.

1. Label each air terminal unit with plan number, nominal airflow, maximum and minimum factory-set airflows, coil type, and ARI certification seal.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install air terminal units according to NFPA 90A, "Standard for the Installation of Air Conditioning and Ventilating Systems."

B. Install air terminal units level and plumb. Maintain sufficient clearance for normal service and maintenance.

C. Install wall-mounted thermostats.

3.2 HANGER AND SUPPORT INSTALLATION

A. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 4, "Hangers and Supports."

B. Building Attachments: Concrete inserts, powder-actuated fasteners, or structural-steel fasteners appropriate for construction materials to which hangers are being attached.

1. Where practical, install concrete inserts before placing concrete.
2. Install powder-actuated concrete fasteners after concrete is placed and completely cured.
3. Use powder-actuated concrete fasteners for standard-weight aggregate concretes and for slabs more than 4 inches (100 mm) thick.
4. Do not use powder-actuated concrete fasteners for lightweight-aggregate concretes and for slabs less than 4 inches (100 mm) thick.
5. Do not use powder-actuated concrete fasteners for seismic restraints.

C. Hangers Exposed to View: Threaded rod and angle or channel supports.

D. Install upper attachments to structures. Select and size upper attachments with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

3.3 CONNECTIONS

A. Connect ducts to air terminal units according to Division 23 Section "Metal Ducts."

B. Make connections to air terminal units with flexible connectors complying with requirements in Division 23 Section "Air Duct Accessories."

3.4 IDENTIFICATION

A. Label each air terminal unit with plan number, nominal airflow, and maximum and minimum factory-set airflows. Comply with requirements in Division 23 Section "Identification for HVAC Piping and Equipment" for equipment labels and warning signs and labels.

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

B. Perform tests and inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

C. Tests and Inspections:

1. After installing air terminal units and after electrical circuitry has been energized, test for compliance with requirements.
2. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

D. Air terminal unit will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

3.6 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. Verify that inlet duct connections are as recommended by air terminal unit manufacturer to achieve proper performance.
3. Verify that controls and control enclosure are accessible.
4. Verify that control connections are complete.
5. Verify that nameplate and identification tag are visible.
6. Verify that controls respond to inputs as specified.

3.7 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain air terminal units.

B. Refer Division 01 for administrative and procedural requirements for demonstration and training.

END OF SECTION 23 36 00

SECTION 23 37 13 - DIFFUSERS, REGISTERS, AND GRILLES.

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
1. Adjustable bar registers and grilles.
2. Fixed face registers and grilles.
3. Security registers and grilles.

B. Related Requirements:
1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated, include the following:

1. Data Sheet: Indicate materials of construction, finish, and mounting details; and performance data including throw and drop, static-pressure drop, and noise ratings.

2. Diffuser, Register, and Grille Schedule: Indicate drawing designation, room location, quantity, model number, size, and accessories furnished.

B. Samples for Initial Selection: For diffusers, registers, and grilles with factory-applied color finishes.

C. Samples for Verification: For diffusers, registers, and grilles, in manufacturer's standard sizes to verify color selected.

D. Source quality-control reports.

PART 2 - PRODUCTS

2.1 REGISTERS AND GRILLES

A. Adjustable Bar Grille :

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. A-J Manufacturing Co., Inc.

b. Anemostat Products; a Mestek company.

c. Carnes.

d. Dayus Register & Grille Inc.

e. Hart & Cooley Inc.

f. Krueger.

g. METALAIRE, Inc.

h. Nailor Industries Inc.

i. Price Industries.

j. Titus.

k. Tuttle & Bailey.

2. Material: Steel or as indicated on contract drawings.

3. Finish: Baked enamel, white.

4. Face Blade Arrangement: Horizontal 3/4 inch (19 mm) apart.

5. Core Construction: Integral.

6. Frame: 1-1/4 inches (32 mm) wide.

7. Mounting: Countersunk screw.

B. Security Register:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. A-J Manufacturing Co., Inc.
   b. Anemostat Products; a Mestek company.
   c. Carnes.
   d. Dayus Register & Grille Inc.
   e. Hart & Cooley Inc.
   f. Krueger.
   g. METALAIRE, Inc.
   h. Nailor Industries Inc.
   i. Price Industries.
   j. Titus.
   k. Tuttle & Bailey.
2. Security Level: Medium.
3. Application: Ducted return.
4. Material: Steel.
5. Material Thickness: 0.19 inch.
6. Finish: Baked enamel, color selected by Architect.
7. Face Arrangement:

   a. Shape: Square or Rectangular as indicated
   b. Design: Perforated.

c. Frame: Yes.
d. Deflection: Zero degrees.
e. Core: None.
f. 3/16-inch- thick, perforated faceplate with 5/16-inch- diameter holes spaced 7/16 inch o.c., staggered at 60 degrees.

8. Damper Operation: Rear operated.
9. Damper Type: Adjustable opposed blade.
10. Wall Sleeve: 3/16 inch welded to face.
11. Mounting: 1-by-1-by-3/16-inch retaining angle frame.

C. Security Grille:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. A-J Manufacturing Co., Inc.
   b. Anemostat Products; a Mestek company.
   c. Carnes.
   d. Dayus Register & Grille Inc.
   e. Hart & Cooley Inc.
   f. Krueger.
   g. METALAIRE, Inc.
   h. Nailor Industries Inc.
   i. Price Industries.
   j. Titus.
   k. Tuttle & Bailey.
2. Security Level: Medium.
3. Application: Ducted return.
4. Material: Steel.
5. Material Thickness: 0.19 inch.
6. Finish: Baked enamel, color selected by Architect.
7. Face Arrangement:

   a. Shape: Square or Rectangular as indicated
   b. Design: Perforated.
   c. Frame: Yes.
   d. Deflection: Zero degrees.
   e. Core: None.
   f. 3/16-inch- thick, perforated faceplate with 5/16-inch- diameter holes spaced 7/16 inch o.c., staggered at 60 degrees.
8. Wall Sleeve: 3/16 inch welded to face.
9. Mounting: 1-by-1-by-3/16-inch retaining angle frame.

D. Fixed Face Register:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. A-J Manufacturing Co., Inc.
   b. Anemostat Products; a Mestek company.
   c. Carnes.
   d. Dayus Register & Grille Inc.
   e. Hart & Cooley Inc.
   f. Krueger.
   g. METALAIRE, Inc.
   h. Nailor Industries Inc.
   i. Price Industries.

j. Titus.
k. Tuttle & Bailey.

2. Material: Steel.
3. Finish: Baked enamel, color selected by Architect.
4. Face Arrangement: 1/2-by-1/2-by-1/2-inch grid or Perforated core as indicated.
5. Core Construction: Integral.
6. Frame: 1-1/4 inches wide.
7. Mounting: Countersunk screw.
8. Damper Type: Adjustable opposed blade.

E. Fixed Face Grille:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. A-J Manufacturing Co., Inc.
   b. Anemostat Products; a Mestek company.
   c. Carnes.
   d. Dayus Register & Grille Inc.
   e. Hart & Cooley Inc.
   f. Krueger.
   g. METALAIRE, Inc.
   h. Nailor Industries Inc.
   i. Price Industries.
   j. Titus.
   k. Tuttle & Bailey.
2. Material: Steel.
3. Finish: Baked enamel, color selected by Architect.
4. Face Arrangement: 1/2-by-1/2-by-1/2-inch grid or Perforated core as indicated.
5. Core Construction: Integral.
6. Frame: 1-1/4 inches wide.
7. Mounting: Countersunk screw.

2.2 SOURCE QUALITY CONTROL

A. Verification of Performance: Rate diffusers, registers, and grilles according to ASHRAE 70, "Method of Testing for Rating the Performance of Air Outlets and Inlets."

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas where diffusers, registers, and grilles are to be installed for compliance with requirements for installation tolerances and other conditions affecting performance of equipment.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install diffusers, registers, and grilles level and plumb.

B. Install diffusers, registers, and grilles with airtight connections to ducts and to allow service and maintenance of dampers, air extractors, and fire dampers.

3.3 ADJUSTING

A. After installation, adjust diffusers, registers, and grilles to air patterns indicated, or as directed, before starting air balancing.

END OF SECTION 23 37 13

SECTION 23 37 23 - HVAC GRAVITY VENTILATORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Roof hoods.

B. Related Requirements:
   1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
   2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 PERFORMANCE REQUIREMENTS

A. Structural Performance: Ventilators shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated without permanent deformation of ventilator components, noise or metal fatigue caused by ventilator blade rattle or flutter, or permanent damage to fasteners and anchors. Wind pressures shall be considered to act normal to the face of the building.
   1. Wind Loads: Determine loads based on a uniform pressure of 20 lbf/sq. ft., acting inward or outward.

B. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes, without buckling, opening of joints, overstressing of components, failure of connections, or other detrimental effects.

   1. Temperature Change (Range): 120 deg F , material surfaces.

C. Water Entrainment: Limit water penetration through unit to comply with ASHRAE 62.1.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product indicated

B. LEED Submittals:

   1. Product Data for Prerequisite IEQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."

C. Shop Drawings: For gravity ventilators. Include plans, elevations, sections, details, ventilator attachments to curbs, and curb attachments to roof structure.

1. Show weep paths, gaskets, flashing, sealant, and other means of preventing water intrusion.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Roof framing plans and other details, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:

1. Structural members to which roof curbs and ventilators will be attached.
2. Sizes and locations of roof openings.

B. Welding certificates.

1.6 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum."
2. AWS D1.3, "Structural Welding Code - Sheet Steel."

1.7 COORDINATION

A. Coordinate sizes and locations of roof curbs, equipment supports, and roof penetrations with actual equipment provided.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Aluminum Sheet: ASTM B 209, Alloy 3003 or 5005 with temper as required for forming or as otherwise recommended by metal producer for required finish.

B. Fasteners: Same basic metal and alloy as fastened metal or 300 Series stainless steel unless otherwise indicated. Do not use metals that are incompatible with joined materials.

1. Use types and sizes to suit unit installation conditions.
2. Use vandal proof screws for exposed fasteners unless otherwise indicated.

C. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

2.2 FABRICATION, GENERAL

A. Factory fabricate gravity ventilators to minimize field splicing and assembly. Disassemble units to the minimum extent as necessary for shipping and handling. Clearly mark units for reassembly and coordinated installation.

B. Fabricate frames, including integral bases, to fit in openings of sizes indicated, with allowances made for fabrication and installation tolerances, adjoining material tolerances, and perimeter sealant joints.

C. Fabricate units with closely fitted joints and exposed connections accurately located and secured.

D. Fabricate supports, anchorages, and accessories required for complete assembly.

E. Perform shop welding by AWS-certified procedures and personnel.

2.3 ROOF HOODS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Acme Engineering and Manufacturing Co..
2. Carnes Co.
3. Loren Cook Company.
4. Greenheck Fan Corporation.

B. Factory or shop fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figures 6-6 and 6-7.

C. Materials: Aluminum sheet, minimum 0.063-inch- thick base and 0.050-inch- thick hood; suitably reinforced.

D. Roof Curbs: Galvanized-steel sheet; with mitered and welded corners; 1-1/2-inch- thick, rigid fiberglass insulation adhered to inside walls; and 1-1/2-inch wood nailer. Size as required to fit roof opening and ventilator base.

1. Configuration: Built-in cant and mounting flange.
2. Overall Height: 12 inches.

E. Bird Screening: Aluminum, 1/2-inch- square mesh, 0.063-inch wire.

F. Capacities and Characteristics: As indicated on drawings.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install gravity ventilators level, plumb, and at indicated alignment with adjacent work.

B. Install gravity ventilators with clearances for service and maintenance.

C. Install perimeter reveals and openings of uniform width for sealants and joint fillers, as indicated.

D. Install concealed gaskets, flashings, joint fillers, and insulation as installation progresses. Comply with Division 7 Section " Security Joint Sealants" for sealants applied during installation.

E. Label gravity ventilators according to requirements specified in Section 230553 "Identification for HVAC Piping and Equipment."

F. Repair finishes damaged by cutting, welding, soldering, and grinding. Restore finishes so no evidence remains of corrective work. Return items that cannot be refinished in the field to the factory, make required alterations, and refinish entire unit or provide new units.

3.2 CONNECTIONS

A. Duct installation and connection requirements are specified in Section 233113 "Metal Ducts". Drawings indicate general arrangement of ducts and duct accessories.

3.3 ADJUSTING

A. Adjust damper linkages for proper damper operation.

END OF SECTION 233723

SECTION 23 51 13.16 - VENT DAMPERS

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Barometric dampers.
   2. Vent dampers.

B. Related Requirements:
   1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
   2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.
B. Shop Drawings: For each type of product.
   1. Include plans, elevations, sections, and attachment details.
   2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   3. Detail fabrication and assembly of hangers and seismic restraints.
   4. Include diagrams for power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

A. Sample Warranty: For special warranty.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For draft control devices to include in emergency, operation, and maintenance manuals.

1.6 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of vent and barometric dampers that fail in materials or workmanship within specified warranty period.

   1. Failure includes failure due to corrosion.

   2. Warranty Period: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 BAROMETRIC DAMPER

A. Damper Construction: High-temperature-enamel-painted steel damper and housing with galvanized-steel breeching connection. Adjustable counterweight with lock. Include knife-edge bearings that do not require lubrication.

2.2 VENT DAMPERS

A. Damper Construction: Stainless-steel damper blade, shaft, and vent pipe with metal, prelubricated bearings.
   1. Electric motor sized to power damper open and closed in approximately 15 seconds in each direction. Power is off when damper is at rest.
   2. Comply with ANSI Z21.66.

B. Controls:
   1. Control transformer.
   2. Keyed wiring harness.
   3. Damper end switch to prove damper is open.
   4. Interlock with exhaust fan to permit operation when damper is open.

2.3 MOTORS

A. Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 23 05 13 – Common Motor Requirements for HVAC Equipment.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install listed components in compliance with the listing.

B. Secure barometric dampers to breechings with hardware compatible with connected materials.

C. Locate barometric and motorized vent dampers as close to draft hood collar as possible.

D. Secure barometric and motorized vent dampers to appliances, breechings, or chimneys with hardware compatible with connected materials.

3.2 CONNECTIONS

A. Ground equipment according to Section 26 05 26 – Grounding and Bonding for Electrical Systems.

B. Connect wiring according to Section 26 05 19 – Low- Voltage Electrical Power Conductors and Cables.

END OF SECTION 23 51 13.16

SECTION 23 51 23 - GAS VENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Listed double-wall vents.

B. Related Requirements:
1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for product.

B. Shop Drawings: For vents.
1. Include plans, elevations, sections, and attachment details.
2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Detail fabrication and assembly of hangers and seismic restraints.

1.4 INFORMATIONAL SUBMITTALS

A. Welding certificates.
B. Sample Warranty: For special warranty.

1.5 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1/D1.1M, "Structural Welding Code - Steel," for hangers and supports.
2. AWS D9.1/D9.1M, "Sheet Metal Welding Code," for shop and field welding of joints and seams in vents.

B. Certified Sizing Calculations: Manufacturer shall certify venting system sizing calculations.

PART 2 - PRODUCTS

2.01 LISTED TYPE B AND BW VENTS

A. Description: Double-wall metal vents tested according to UL 441 and rated for 480 deg. F continuously for Type B or 550 deg. F continuously for Type BW; with neutral or negative flue pressure complying with NFPA 211.

B. Construction: Inner shell and outer jacket separated by at least a 1/4-inch airspace.

C. Outer Jacket: Galvanized steel.

D. Accessories: Tees, elbows, increasers, draft-hood connectors, terminations, adjustable roof flashings, storm collars, support assemblies, thimbles, firestop spacers, and fasteners; fabricated from similar materials and designs as vent-pipe straight sections; all listed for same assembly.

1. Termination: Round chimney top designed to exclude minimum 98 percent of rainfall.

2.02 EXAMINATION

A. Examine areas and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

2.03 APPLICATION

A. Listed Type B and BW Vents: Vents for certified gas appliances.

2.04 INSTALLATION OF LISTED VENTS

A. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Section 07 72 00 – Roof Accessories.

B. Comply with minimum clearances from combustibles and minimum termination heights according to product listing or NFPA 211, whichever is most stringent.

C. Seal between sections of positive-pressure vents according to manufacturer's written installation instructions, using sealants recommended by manufacturer.

D. Support vents at intervals recommended by manufacturer to support weight of vents and all accessories, without exceeding appliance loading.

E. Lap joints in direction of flow.

2.05 CLEANING

A. After completing system installation, including outlet fittings and devices, inspect exposed finish. Remove burrs, dirt, and construction debris, and repair damaged finishes.

2.06 EXECUTION

A. Installation of double wall connectors, breechings, and vents:

1. Install all steel, positive pressure, double wall gas vents in accordance with manufacturer's written instructions.

2. Installation instructions and UL listing. Maintain minimum clearances from combustibles specified in UL listing.

3. Seal joints between sections of positive pressure vents in accordance with manufacturer.

4. Installation instructions, and using only sealants recommended by manufacturer.

5. Support vents at intervals recommended by the manufacturer to support the weight of the vent and all accessories, without exceeding loading of appliances.

B. Protection:

1. Temporary Closure: At ends of breechings and chimneys which are not completed or connected to equipment, provide temporary closure which will prevent entrance of dust and debris until installations are completed.

END OF SECTION 23 51 23

SECTION 23 62 00 - PACKAGED COMPRESSOR AND CONDENSER UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes packaged, refrigerant compressor and condenser units.

B. Related Requirements:
   1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
   2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 ACTION SUBMITTALS

A. Product Data: For each compressor and condenser unit. Include rated capacities, operating characteristics, and furnished specialties and accessories. Include equipment dimensions, weights and structural loads, required clearances, method of field assembly, components, and location and size of each field connection.

B. LEED Submittals:

   1. Product Data for Prerequisite EA 2: Documentation indicating that units comply with applicable requirements in ASHRAE/IESNA 90.1.
   2. Product Data for Credit EA 4: Documentation indicating that compressor and condenser units and refrigerants comply.

C. Shop Drawings: For compressor and condenser units. Include plans, elevations, sections, details, and attachments to other work.

   1. Wiring Diagrams: For power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Plans, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:

   1. Structural members to which compressor and condenser units will be attached.
   2. Liquid and vapor pipe sizes.
   3. Refrigerant specialties.
   4. Piping including connections, oil traps, and double risers.
   5. Compressors.
   6. Evaporators.

B. Field quality-control reports.

C. Warranty: Sample of special warranty.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For compressor and condenser units to include in emergency, operation, and maintenance manuals.

1.6 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Fabricate and label refrigeration system according to ASHRAE 15, "Safety Standard for Refrigeration Systems."

C. ASHRAE/IESNA 90.1 Compliance: Applicable requirements in ASHRAE/IESNA 90.1, Section 6, "Heating, Ventilating, and Air-Conditioning."

D. ASME Compliance: Fabricate and label water-cooled compressor and condenser units to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

1.7 COORDINATION

A. Coordinate sizes and locations of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Section 033000 "Cast-In-Place Concrete" and Section 033053 "Miscellaneous Cast-In-Place Concrete."

B. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Section 077200 "Roof Accessories."

C. Coordinate location of piping and electrical rough-ins.

1.8 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of compressor and condenser units that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

    a. Compressor failure.
    b. Condenser coil leak.
2. Warranty Period (Compressor Only): 10 years from date of Substantial Completion.
3. Warranty Period (Components Other Than Compressor): Five years from date of Substantial Completion.
4. Warranty Period (Condenser Coil Only): Five years from date of Substantial Completion.

1.9 MAINTENANCE SPARE PARTS

A. Spare parts: Manufacturer's recommended quantity, but not less than 10% of all replacement parts, with a minimum quantity of one each.

PART 2 - PRODUCTS

2.1 COMPRESSOR AND CONDENSER UNITS, AIR COOLED, 1 TO 5 TONS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

1. Carrier Corporation; Carrier Air Conditioning Div.
2. Lennox Industries Inc.
3. McQuay International.
4. Trane Co. (The); Worldwide Applied Systems Group.
5. York International Corp.

B. Description: Factory assembled and tested; consisting of compressor, condenser coil, fan, motors, refrigerant reservoir, and operating controls.

C. Compressor: Scroll, hermetically sealed, with rubber vibration isolators.

1. Motor: Single speed, and includes thermal- and current-sensitive overload devices, start capacitor, relay, and contactor.
2. Two-Speed Compressor: Include manual-reset, high-pressure switch and automatic-reset, low-pressure switch.
3. Accumulator: Suction tube.

D. Refrigerant: R-410A.

E. Condenser Coil: Seamless copper-tube, aluminum-fin coil; circuited for integral liquid subcooler, with removable drain pan and brass service valves with service ports.

F. Condenser Fan: Direct-drive, aluminum propeller fan; with permanently lubricated, totally enclosed fan motor with thermal-overload protection and ball bearings.

G. Accessories:
1. Crankcase heater.
2. Cycle Protector: Automatic-reset timer to prevent rapid compressor cycling.
3. Filter-dryer.
4. High-Pressure Switch: Automatic-reset switch cycles compressor off on high refrigerant pressure.
5. Liquid-line solenoid.
6. Low-Ambient Controller: Cycles condenser fan to permit operation down to 30 deg F with time-delay relay to bypass low-pressure switch.
7. Low-Pressure Switch: Automatic-reset switch cycles compressor off on low refrigerant pressure.
8. PE mounting base.

9. Precharged and insulated suction and liquid tubing.
10. Sound Hood: Wraps around sound attenuation cover for compressor.
11. Thermostatic expansion valve.
12. Time-Delay Relay: Continues operation of evaporator fan after compressor shuts off.
13. Reversing valve.

H. Unit Casing: Galvanized steel, finished with baked enamel; with removable panels for access to controls, weep holes for water drainage, and mounting holes in base. Mount service valves, fittings, and gage ports on exterior of casing.

I. Capacities and Characteristics:

1. Compressor and Condenser Unit: As indicated on Drawings.

2.2 MOTORS

A. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."

1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.

2.3 SOURCE QUALITY CONTROL

A. Verification of Performance: Rate compressor and condenser units according to ARI 206/110].

B. Energy Efficiency: Equal to or greater than prescribed by ASHRAE/IESNA 90.1, "Energy Efficient Design of New Buildings except Low-Rise Residential Buildings," Section 6, "Heating, Ventilating, and Air-Conditioning."

C. Test and inspect shell and tube condensers according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

D. Testing Requirements: Factory test sound-power-level ratings according to ARI 270].

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of compressor and condenser units.

B. Examine roughing-in for refrigerant piping systems to verify actual locations of piping connections before equipment installation.

C. Examine floors, and roofs for suitable conditions where compressor and condenser units will be installed.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install units level and plumb, firmly anchored in locations indicated.

B. Install roof-mounting units on equipment supports specified in Section 077200 "Roof Accessories."

C. Equipment Mounting:

1. Install compressor and condenser units on cast-in-place concrete equipment bases. Comply with requirements for equipment bases and foundations specified in Section 033000 "Cast-in-Place Concrete." .
2. Comply with requirements for vibration isolation and seismic control devices specified in Section 230548 "Vibration and Seismic Controls for HVAC."

D. Maintain manufacturer's recommended clearances for service and maintenance.

E. Loose Components: Install electrical components, devices, and accessories that are not factory mounted.

3.3 CONNECTIONS

A. Where installing piping adjacent to equipment, allow space for service and maintenance of equipment.

B. Connect precharged refrigerant tubing to unit's quick-connect fittings. Install tubing so it does not interfere with access to unit. Install furnished accessories.

C. Connect refrigerant piping to air-cooled compressor and condenser units; maintain required access to unit. Install furnished field-mounted accessories. Refrigerant piping and specialties are specified in Section 232300 "Refrigerant Piping."

3.4 FIELD QUALITY CONTROL

A. Perform tests and inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections, and to assist in testing.

B. Verify that vibration isolation and flexible connections properly dampen vibration transmission to structure.

C. Compressor and condenser units will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

3.5 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

B. Lubricate bearings on fan motors.

C. Verify that fan wheel is rotating in the correct direction and is not vibrating or binding.

D. Adjust fan belts to proper alignment and tension.

E. Start unit according to manufacturer's written instructions and complete manufacturer's startup checklist.

F. Measure and record airflow and air temperature rise over coils.

G. Verify proper operation of condenser capacity control device.

H. Verify that vibration isolation and flexible connections properly dampen vibration transmission to structure.

I. After startup and performance test, lubricate bearings.

3.6 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain compressor and condenser units.

B. Refer Division 01 for administrative and procedural requirements for demonstration and training.

END OF SECTION 236200

SECTION 23 63 13 - AIR-COOLED REFRIGERANT CONDENSERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes packaged, air-cooled condensers for indoor installation.

B. Related Requirements:
1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 SUBMITTALS

A. Product Data: For each air-cooled condenser, include rated capacities, operating characteristics, furnished specialties, and accessories. Include equipment dimensions, weights and structural loads, required clearances, method of field assembly, components, and location and size of each field connection.

B. Operation and Maintenance Data: For air-cooled condensers to include in emergency, operation, and maintenance manuals.

1.4 QUALITY ASSURANCE

A. Fabricate and label refrigeration system according to ASHRAE 15, "Safety Code for Mechanical Refrigeration."

B. ASHRAE/IESNA 90.1-2004 Compliance: Applicable requirements in ASHRAE/IESNA 90.1-2004, Section 6 - "Heating, Ventilating, and Air-Conditioning."

1.5 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

B. Coordinate location of refrigerant piping and electrical rough-ins.

1.6 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of condenser units that fail in materials or workmanship for not less than a period of two years.

1.7 MAINTENANCE SPARE PARTS

A. Spare parts: Manufacturer's recommended quantity, but not less than 10% of all replacement parts, with a minimum quantity of one each.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. McQuay International.

2. Trane Co. (The); Worldwide Applied Systems Group.

3. York International Corp.

4. Dectron Inc.

5. Data Aire Inc.

6. Or approved equal.

2.2 MANUFACTURED UNITS

A. Description: Factory assembled and tested; consisting of casing, condenser coils, condenser fans, motors, and unit controls.

B. Condenser Coil: Seamless copper-tube, finned coil; factory tested at 425 psig (2930 kPa).

1. Coil Fin: Aluminum.

2. Circuit: To match compressors with liquid subcooling coil.

3. Refrigerant Accessories: Provide receiver, pressure control, and solenoid valve for each circuit.

C. Condenser Fans and Drives: Propeller fans with aluminum fan blades, for vertical air discharge; directly driven with permanently lubricated ball bearing motors with integral current- and thermal-overload protection.

D. Unit Casings: Galvanized steel treated and finished with manufacturer's standard paint coating, designed for indoor/ outdoor installation, and with the following:

1. Removable panels for access to controls, condenser fans, motors, and drives.

2. Lifting eyes.

E. Unit control circuit shall contain 24-V transformer for unit controls. Operating and Safety Controls: Include condenser fan motor thermal and overload cutouts; 115-V control transformer, if required; magnetic contactors for condenser fan motors and a non fused factory-mounted and -wired disconnect switch for single external electrical power connection.

2.3 MOTORS

A. General requirements for motors are specified in Section 23 05 13 – Common Motor Requirements for HVAC Equipment.

1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.

2. Controllers, Electrical Devices, and Wiring: Electrical devices and connections are specified in Division 26 Sections.

2.4 SOURCE QUALITY CONTROL

A. Verification of Performance: Rate air-cooled condensers according to ARI 460.

B. Testing Requirements: Factory test sound-power-level ratings according to ARI 270.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of air-cooled condensers.

B. Examine roughing-in for refrigerant piping systems to verify actual locations of piping connections before equipment installation.

C. Examine walls, floors, and roofs for suitable conditions where air-cooled condensers will be installed.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install units level and plumb, firmly anchored in locations indicated; maintain manufacturer's recommended clearances.

B. Install air-cooled condensers on concrete base. Concrete base is specified in Section 23 05 00 – Common Work Results for HVAC, and concrete materials and installation requirements are specified in Division 03.

C. Concrete Bases:

1. Install dowel rods to connect concrete base to concrete slab. Unless otherwise indicated, install dowel rods on 18-inch (450-mm) centers around full perimeter of the base.

2. For equipment supported on structural slab, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.

3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

4. Install anchor bolts to elevations required for proper attachment to supported equipment.

5. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

D. Vibration Isolation: Mount air-cooled condensers spring isolators. Retain one of first two paragraphs and associated subparagraph below for suspended units.

E. Maintain manufacturer's recommended clearances for service and maintenance.

F. Loose Components: Install electrical components, devices, and accessories that are not factory mounted.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to machine to allow service and maintenance.

C. Refrigerant Piping: Connect piping to unit with pressure relief, service valve, filter-dryer, and moisture indicator on each refrigerant-circuit liquid line. Refrigerant piping and specialties are specified in Section 23 23 00 – Refrigerant Piping.

3.4 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare test reports:

1. Perform electrical test and visual and mechanical inspection.

2. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.

3. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation. Complete manufacturer's starting checklist.

4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

5. Verify proper airflow over coils.

B. Verify that vibration isolation and flexible connections properly dampen vibration transmission to structure.

C. Remove and replace malfunctioning air-cooled condensers and retest as specified above.

3.5 STARTUP SERVICE

A. Complete installation and startup checks according to manufacturer's written instructions and perform the following:

1. Inspect for physical damage to unit casing.

2. Verify that access doors move freely and are weather tight.

3. Clean units and inspect for construction debris.

4. Verify that all bolts and screws are tight.

5. Adjust vibration isolation and flexible connections.

6. Verify that controls are connected and operational.

B. Lubricate bearings on fans.

C. Verify that fan wheel is rotating in the correct direction and is not vibrating or binding.

D. Start unit according to manufacturer's written instructions and complete manufacturer's startup checklist.

E. Measure and record airflow over coils.

F. Verify proper operation of capacity control device.

G. Verify that vibration isolation and flexible connections properly dampen vibration transmission to structure.

H. After startup and performance test, lubricate bearings.

3.6 DEMONSTRATION

A. Engage a factory-authorized service representative to train maintenance personnel to adjust, operate, and maintain units..

B. Refer Division 01 for administrative and procedural requirements for demonstration and training.

END OF SECTION 23 63 13

SECTION 23 73 13 - MODULAR INDOOR CENTRAL-STATION AIR-HANDLING UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Constant-air-volume, single-zone air-handling units.

2. Variable-air-volume, single-zone air-handling units.

B. Related Requirements:
1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 PERFORMANCE REQUIREMENTS

A. Structural Performance: Casing panels shall be self-supporting and capable of withstanding 133 percent of internal static pressures indicated, without panel joints exceeding a deflection of L/200 where "L" is the unsupported span length within completed casings.

1.4 ACTION SUBMITTALS

A. Product Data: For each air-handling unit indicated.

1. Unit dimensions and weight.

2. Cabinet material, metal thickness, finishes, insulation, and accessories.

3. Fans:

a. Certified fan-performance curves with system operating conditions indicated.

b. Certified fan-sound power ratings.

c. Fan construction and accessories.

d. Motor ratings, electrical characteristics, and motor accessories.

4. Certified coil-performance ratings with system operating conditions indicated.

5. Dampers, including housings, linkages, and operators.

6. Filters with performance characteristics.

B. LEED Submittals:

1. Product Data for Prerequisite IEQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Floor plans and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Mechanical-room layout and relationships between components and adjacent structural and mechanical elements.

2. Support location, type, and weight.

3. Field measurements.

B. Source quality-control reports.

C. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For air-handling units to include in emergency, operation, and maintenance manuals.

1.7 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. NFPA Compliance: Comply with NFPA 90A for design, fabrication, and installation of air-handling units and components.

C. ARI Certification: Air-handling units and their components shall be factory tested according to ARI 430, "Central-Station Air-Handling Units," and shall be listed and labeled by ARI.

D. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."

E. Comply with NFPA 70.

1.8 COORDINATION

A. Coordinate sizes and locations of concrete bases with actual equipment provided.

B. Coordinate sizes and locations of structural-steel support members, if any, with actual equipment provided.

1.9 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of air handling units that fail in materials or workmanship for not less than a period of two years.

1.10 MAINTENANCE SPARE PARTS

A. Belts: Two sets for each belt-driven unit.

B. Filters: Two sets for each unit.

C. Other spare parts: Manufacturer's recommended quantity, but not less than 10% of all replacement parts, with a minimum quantity of one each.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. McQuay International

2. Trane; American Standard Inc.

3. YORK International Corporation.

4. Or Engineer approved equal.

2.2 UNIT CASINGS

A. General Fabrication Requirements for Casings:

1. Type: Double wall.

2. Forming: Form walls, roofs, and floors with at least two breaks at each joint.

3. Casing Joints: Sheet metal screws or pop rivets.

4. Sealing: Seal all joints with water-resistant sealant.

5. Casing Coating: Hot-dip galvanized.

6. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.

B. Casing Insulation and Adhesive:

1. Materials: ASTM C 1071.

2. Location and Application: Encased between outside and inside casing.

C. Inspection and Access Panels and Access Doors:

1. Panel and Door Fabrication: Formed and reinforced, double-wall and insulated panels of same materials and thicknesses as casing.

2. Inspection and Access Panels:

   a. Fasteners: Two or more camlock type for panel lift-out operation. Arrangement shall allow panels to be opened against air-pressure differential.

   b. Gasket: Neoprene, applied around entire perimeters of panel frames.

   c. Size: Large enough to allow inspection and maintenance of air-handling unit's internal components.

3. Access Doors:

   a. Hinges: A minimum of two ball-bearing hinges or stainless-steel piano hinge and two wedge-lever-type latches, operable from inside and outside. Arrange doors to be opened against air-pressure differential.

   b. Gasket: Neoprene, applied around entire perimeters of panel frames.

   c. Size: At least 18 inches (450 mm) wide by full height of unit casing up to a maximum height of 72 inches (1800 mm).

4. Locations and Applications:

   a. Fan Section: Doors.

   b. Access Section: Doors.

   c. Coil Section: Inspection and access panel.

   d. Damper Section: Doors.

   e. Filter Section: Doors large enough to allow periodic removal and installation of filters.

   f. Mixing Section: Doors.

5. Service Light: 100-W vaporproof fixture with switched junction box located outside adjacent to door.

   a. Locations: Each section accessed with door.

   b. Units: AHU-1 and AHU-2.

D. Condensate Drain Pans:

1. Fabricated with slope in at least two planes to collect condensate from cooling coils (including coil piping connections, coil headers, and return bends) and from humidifiers and to direct water toward drain connection.

   a. Length: Extend drain pan downstream from leaving face to comply with ASHRAE 62.1.

   b. Depth: A minimum of 2 inches (50 mm) deep.

2. Double-wall, stainless-steel sheet with space between walls filled with foam insulation and moisture-tight seal.

3. Drain Connection: Located at lowest point of pan and sized to prevent overflow. Terminate with threaded nipple on one end of pan.

   a. Minimum Connection Size: NPS 1 (DN 25).

4. Units with stacked coils shall have an intermediate drain pan to collect condensate from top coil.

E. Air-Handling-Unit Mounting Frame: Formed galvanized-steel channel or structural channel supports, designed for low deflection, welded with integral lifting lugs.

2.3 FAN, DRIVE, AND MOTOR SECTION

A. Fan and Drive Assemblies: Statically and dynamically balanced and designed for continuous operation at maximum-rated fan speed and motor horsepower. Fan performance shall be certified to complying with AHRI standard 430.

1. Shafts: Designed for continuous operation at maximum-rated fan speed and motor horsepower, and with field-adjustable alignment.

   a. Turned, ground, and polished hot-rolled steel with keyway. Ship with a protective coating of lubricating oil.

   b. Designed to operate at no more than 70 percent of first critical speed at top of fan's speed range.

B. Centrifugal Fan Housings: Formed- and reinforced-steel panels to form curved scroll housings with shaped cutoff and spun-metal inlet bell.

1. Bracing: Steel angle or channel supports for mounting and supporting fan scroll, wheel, motor, and accessories.

2. Housing for Supply Fan: Attach housing to fan-section casing with metal-edged flexible duct connector.

3. Flexible Connector: Factory fabricated with a fabric strip 3-1/2 inches (89 mm) wide attached to 2 strips of 2-3/4-inch- (70-mm-) wide, 0.028-inch- (0.7-mm-) thick, galvanized-steel sheet or 0.032-inch- (0.8-mm-) thick aluminum sheets; select metal compatible with casing.

   a. Flexible Connector Fabric: Glass fabric, double coated with neoprene. Fabrics, coatings, and adhesives shall comply with UL 181, Class 1.

      1) Fabric Minimum Weight: 26 oz./sq. yd. (880 g/sq. m).

      2) Fabric Tensile Strength: 480 lbf/inch (84 N/mm) in the warp and 360 lbf/inch (63 N/mm) in the filling.

      3) Fabric Service Temperature: Minus 40 to plus 200 deg F (Minus 40 to plus 93 deg C).

C. Plenum Fan Housings: Steel frame and panel; fabricated without fan scroll and volute housing.

D. Backward-Inclined, Centrifugal Fan Wheels: Single-width-single-inlet and double-width-double-inlet construction with curved inlet flange, backplate, backward-inclined blades welded or riveted to flange and backplate; cast-iron or cast-steel hub riveted to backplate and fastened to shaft with set screws.

E. Forward-Curved, Centrifugal Fan Wheels: Inlet flange, backplate, and shallow blades with inlet and tip curved forward in direction of airflow and mechanically fastened to flange and backplate; cast-steel hub swaged to backplate and fastened to shaft with set screws.

F. Fan Shaft Bearings:

1. Prelubricated and Sealed, Ball Bearings: Self-aligning, pillow-block type with a rated life of 120,000 hours according to ABMA 9.

2. Grease-Lubricated, Tapered-Roller Bearings: Self-aligning, pillow-block type with double-locking collars and 2-piece, cast-iron housing with grease lines extended to outside unit and a rated life of 120,000 hours according to ABMA 11.

3. Grease-Lubricated Bearings: Self-aligning, pillow-block-type, ball or roller bearings with adapter mount and two-piece, cast-iron housing with grease lines extended to outside unit.

G. Belt Drives: Factory mounted, with adjustable alignment and belt tensioning, and with 1.5 service factor based on fan motor.

1. Pulleys: Cast iron or cast steel with split, tapered bushing; dynamically balanced at factory.

2. Motor Pulleys: Adjustable pitch for use with 5-hp motors and smaller; fixed pitch for use with motors larger than 5 hp. Select pulley size so pitch adjustment is at the middle of adjustment range at fan design conditions.

3. Belts: Oil resistant, nonsparking, and nonstatic; in matched sets for multiple-belt drives.

4. Belt Guards: Comply with requirements specified by OSHA and fabricate according to SMACNA's "HVAC Duct Construction Standards"; 0.1046-inch- (2.7-mm-) thick, 3/4-inch (20-mm) diamond-mesh wire screen, welded to steel angle frame; prime coated.

H. Internal Vibration Isolation: Fans shall be factory mounted with manufacturer's standard vibration isolation mounting devices having a minimum static deflection of 2 inches (50 mm).

I. Motor: Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."

1. Enclosure Type: Totally enclosed, fan cooled.

2. NEMA Premium (TM) efficient motors as defined in NEMA MG 1.

3. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.

4. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in electrical Sections.

2.4 COIL SECTION

A. General Requirements for Coil Section:

1. Comply with ARI 410.

2. Fabricate coil section to allow removal and replacement of coil for maintenance and to allow in-place access for service and maintenance of coil(s).

3. Coils shall not act as structural component of unit.

B. Water Coils

1. Water coils shall have ¼ inch plugged vent or drain tap on each connection.

2. Water coils shall be proof tested to 300 psi and leak tested under water to 200 psi.

3. Coil shall be have aluminum fins and seamless copper tubes. Coil casing shall be galvanized steel, and headers shall be constructed of copper pipe.

4. Coil fins shall have collars, drawn, belled and firmly bended to tubes.

5. Low limit switch: Factory installed double pole low limit switch with push button reset shall be provided for each coil.

2.5 AIR FILTRATION SECTION

A. General Requirements for Air Filtration Section:

1. Comply with NFPA 90A.

2. Provide minimum arrestance according to ASHRAE 52.1, and a minimum efficiency reporting value (MERV) according to ASHRAE 52.2.

3. Provide filter holding frames arranged for flat or angular orientation, with access doors on both sides of unit. Filters shall be removable from one side or lifted out from access plenum.

B. Extended-Surface, Disposable Panel Filters:

1. Factory-fabricated, dry, extended-surface type.

2. Thickness: 2 inches (50 mm).

3. Merv (ASHRAE 52.2): 8.

4. Media: Fibrous material formed into deep-V-shaped pleats and held by self-supporting wire grid.

5. Media-Grid Frame: Nonflammable cardboard.

6. Mounting Frames: Welded, galvanized steel, with gaskets and fasteners, suitable for bolting together into built-up filter banks.

C. Filter Gage:

1. 2-inch- (50-mm-) diameter, diaphragm-actuated dial in metal case.

2. Vent valves.

3. Black figures on white background.

4. Front recalibration adjustment.

5. 2 percent of full-scale accuracy.

6. Range: 0- to 1.0-inch wg (0 to 250 Pa).

7. Accessories: Static-pressure tips with integral compression fittings, 1/4-inch (6-mm) aluminum tubing, and 2- or 3-way vent valves.

2.6 DAMPERS

A. General Requirements for Dampers: Leakage rate, according to AMCA 500, "Laboratory Methods for Testing Dampers for Rating," shall not exceed 2 percent of air quantity at 2000-fpm (10-m/s) face velocity through damper and 4-inch wg (1000-Pa) pressure differential.

B. Damper Operators: Comply with requirements in Section 23 09 00 – HVAC Instrumentation and Controls.

C. Outdoor- and Return-Air Mixing Dampers: Parallel-blade, aluminum dampers mechanically fastened to steel operating rod in reinforced cabinet. Connect operating rods with common linkage and interconnect linkages so dampers operate simultaneously.

D. Mixing Section: Multiple-blade, air-mixer assembly located immediately downstream of mixing section.

E. Combination Filter and Mixing Section:

1. Cabinet support members shall hold 2-inch- (50-mm-) thick, pleated, flat, permanent or throwaway filters.

2. Multiple-blade, air-mixer assembly shall mix air to prevent stratification, located immediately downstream of mixing box.

2.7 AIRFLOW MEASURING STATIONS

A. Airflow monitoring stations shall provide an electric signal that corresponds to airflow for controlling and documenting airflow. Stations shall be compatible with DDC control system. Refer to Section 23 09 00 – HVAC Instrumentation and Controls.

2.8 SOURCE QUALITY CONTROL

A. Fan Sound-Power Level Ratings: Comply with AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data." Test fans according to AMCA 300, "Reverberant

Room Method for Sound Testing of Fans." Fans shall bear AMCA-certified sound ratings seal.

B. Fan Performance Rating: Factory test fan performance for airflow, pressure, power, air density, rotation speed, and efficiency. Rate performance according to AMCA 210, "Laboratory Methods of Testing Fans for Aerodynamic Performance Rating."

C. Water Coils: Factory tested to 300 psig (2070 kPa) according to ARI 410 and ASHRAE 33.

PART 3 - EXECUTION

3.1 CONSTRUCTION

A. If permanently installed air handlers are used during construction, filtration media with a Minimum Efficiency Reporting Value (MERV) of 8 shall be used at each return air grille, as determined by ASHRAE 52.2-1999. Replace all filtration media immediately prior to occupancy.

3.2 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine casing insulation materials and filter media before air-handling unit installation. Reject insulation materials and filter media that are wet, moisture damaged, or mold damaged.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 INSTALLATION

A. Equipment Mounting: Install air-handling units on concrete bases. Secure units to anchor bolts installed in concrete bases.

1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch (450-mm) centers around the full perimeter of concrete base.

2. Install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.

3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

4. Install anchor bolts to elevations required for proper attachment to supported equipment.

B. Arrange installation of units to provide access space around air-handling units for service and maintenance.

C. Do not operate fan system until filters (temporary or permanent) are in place. Replace temporary filters used during construction and testing, with new, clean filters.

D. Install filter-gage, static-pressure taps upstream and downstream of filters. Mount filter gages on outside of filter housing or filter plenum in accessible position. Provide filter gages on filter banks, installed with separate static-pressure taps upstream and downstream of filters.

3.4 CONNECTIONS

A. Comply with requirements for piping specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to air-handling unit to allow service and maintenance.

C. Connect piping to air-handling units mounted on vibration isolators with flexible connectors.

D. Connect duct to air-handling units with flexible connections. Comply with requirements in Section 23 33 00 – Air Duct Accessories.

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

B. Perform tests and inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

C. Tests and Inspections:

1. Leak Test: After installation, fill water and steam coils with water, and test coils and connections for leaks.

2. Charge refrigerant coils with refrigerant and test for leaks.

3. Fan Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.

4. Automatic-Roll-Filter Operational Test: Operate filters to demonstrate compliance with requirements. Test for leakage of unfiltered air while system is operating.

5. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

D. Air-handling unit or components will be considered defective if unit or components do not pass tests and inspections.

E. Prepare test and inspection reports.

3.6 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.

2. Verify that shipping, blocking, and bracing are removed.

3. Verify that unit is secure on mountings and supporting devices and that connections to piping, ducts, and electrical systems are complete. Verify that proper thermal-overload protection is installed in motors, controllers, and switches.

4. Verify proper motor rotation direction, free fan wheel rotation, and smooth bearing operations. Reconnect fan drive system, align belts, and install belt guards.

5. Verify that bearings, pulleys, belts, and other moving parts are lubricated with factory-recommended lubricants.

6. Verify that zone dampers fully open and close for each zone.

7. Verify that face-and-bypass dampers provide full face flow.

8. Verify that outdoor- and return-air mixing dampers open and close, and maintain minimum outdoor-air setting.

9. Comb coil fins for parallel orientation.

10. Verify that proper thermal-overload protection is installed for electric coils.

11. Install new, clean filters.

12. Verify that manual and automatic volume control and fire and smoke dampers in connected duct systems are in fully open position.

B. Starting procedures for air-handling units include the following:

1. Energize motor; verify proper operation of motor, drive system, and fan wheel. Adjust fan to indicated rpm. Replace fan and motor pulleys as required to achieve design conditions.

2. Measure and record motor electrical values for voltage and amperage.

3. Manually operate dampers from fully closed to fully open position and record fan performance.

3.7 ADJUSTING

A. Adjust damper linkages for proper damper operation.

B. Comply with requirements in Section 23 05 93 – Testing, Adjusting, and Balancing for HVAC, for air-handling system testing, adjusting, and balancing.

3.8 CLEANING

A. After completing system installation and testing, adjusting, and balancing air-handling unit and air-distribution systems and after completing startup service, clean air-handling units internally to remove foreign material and construction dirt and dust. Clean fan wheels, cabinets, dampers, coils, and filter housings, and install new, clean filters.

3.9 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain air-handling units.

B. Refer Division 01 for administrative and procedural requirements for demonstration and training

END OF SECTION 23 73 13

SECTION 23 73 14 - CONDENSING UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes air- cooled condensing units.

B. Related Requirements:
1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 SUBMITTALS

A. Product Data: For each condensing unit, include rated capacities, operating characteristics, furnished specialties, and accessories. Include equipment dimensions, weights and structural loads, required clearances, method of field assembly, components, and location and size of each field connection.

B. Coordination Drawings: Plans, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:

1. Liquid and vapor pipe sizes.

2. Refrigerant specialties.

3. Piping including connections, oil traps, and double risers.

4. Evaporators.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For condensing units to include in emergency, operation, and maintenance manuals.

E. Warranty: Special warranty specified in this Section.

1.4 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of condensing units and are based on the specific system indicated. Refer to Division 1 Section "Product Requirements."

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Fabricate and label refrigeration system according to ASHRAE 15, "Safety Code for Mechanical Refrigeration."

1. Units shall be designed to operate with HCFC-free refrigerants.

D. ASME Compliance: Fabricate and label water-cooled condensing units to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.

1.5 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 3.

B. Coordinate location of piping and electrical rough-ins.

1.6 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of condensing units that fail in materials or workmanship for not less than a period of two years.

1. Failures include, but are not limited to, the following:

a. Compressor failure.

b. Condenser coil leak.

1.7 MAINTENANCE SPARE PARTS

A. Spare parts: Manufacturer’s recommended quantity, but not less than 10% of all replacement parts, with a minimum quantity of one each.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 sections where titles below introduce lists, the following requirements apply to product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 CONDENSING UNITS, AIR COOLED

A. Manufacturers:

1. Aaon.

2. Carrier Corporation; Carrier Air Conditioning Div.

3. Continental Products.

4. Engineered Air.

5. Lennox Industries Inc.

6. McQuay International.

7. Rheem Manufacturing Air Conditioning Div.

8. Trane Co. (The); Worldwide Applied Systems Group.

9. York International Corp.

B. Description: Factory assembled and tested, air cooled; consisting of casing, compressors, condenser coils, condenser fans and motors, piping, wiring and unit controls in a weather proof cabinet.

C. Compressor: Two commercial duty sealed hermetic scroll type compressors, piped in separate refrigeration circuits, internal over current and over temperature protection, mounted on external rubber isolators, and crankcase heater.

D. Condenser Coil: Seamless copper-tube, aluminum-fin coil, including sub-cooling circuit, exterior service port connection. Factory pressure test coils, then dehydrate by drawing a vacuum and fill with a holding charge of nitrogen or refrigerant.

E. Refrigeration Circuit: Field installed sealed solid core filter-dryer in liquid line, and service valves in suction and liquid line.

F. Refrigerant: R 410A.

G. Condenser Fans: Propeller-type vertical discharge; direct driven. Include the following:

1. Totally enclosed, internally overload protected, permanently lubricated ball-bearing motors.

2. Separate motor for each fan.

3. Dynamically balanced, aluminum blade, fan assemblies.

H. Operating and safety controls include the following:

1. Manual-reset, high-pressure cutout switches.

2. Automatic-reset, low-pressure cutout switches.

3. Low oil pressure cutout switch.

4. Compressor-winding thermostat cutout switch.

5. Three-leg, compressor-overload protection.

6. Control transformer.

7. Magnetic contactors for compressor and condenser fan motors.

8. Timer to prevent excessive compressor cycling.

9. Loss of charge protection.

10. Evaporator defrost control.

I. Accessories:

1. Refrigeration distributer.

2. Thermal expansion valves.

3. Gage Panel: Package with refrigerant circuit suction and discharge gages.

4. Liquid line sight glass.

5. Coil guard on condenser coil.

6. Suction line accumulator for refrigerating lines exceeding 100 feet.

J. Unit Casings: Designed for outdoor installation with weather protection for components and controls and with removable panels for required access to compressors, controls, condenser fans, motors, and drives. Additional features include the following:

1. Steel, galvanized or zinc coated, for exposed casing surfaces; treated and finished with manufacturer's standard paint coating.

2. Perimeter base rail with forklift slots and lifting holes to facilitate rigging.

3. Gasketed control panel door.

4. Condenser coil grille to protect coil from physical damage.

2.3 MOTORS

A. General requirements for motors are specified in 23 05 13 Common Motor Requirements for HVAC

1. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.

2. Controllers, Electrical Devices, and Wiring: Electrical devices and connections are specified in Division 26 Sections.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of condensing units.

B. Examine roughing-in for refrigerant piping systems to verify actual locations of piping connections before equipment installation.

C. Examine walls, and exterior locations for suitable conditions where condensing units will be installed.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install units level and plumb, firmly anchored in locations indicated; maintain manufacturer's recommended clearances.

B. Vibration Isolation: Mount condensing units on rubber pads with a minimum deflection of 1/4 inch (6.35 mm). Vibration isolation devices and installation requirements are specified in Section 23 05 48 – Vibration and Seismic Controls for HVAC Piping and Equipment.

C. Maintain manufacturer's recommended clearances for service and maintenance.

D. Loose Components: Install electrical components, devices, and accessories that are not factory mounted.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Division 23 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Install piping adjacent to machine to allow service and maintenance.

C. Connect pre-charged refrigerant tubing to unit's quick-connect fittings. Install tubing so it does not interfere with access to unit. Install furnished accessories.

D. Connect refrigerant piping to air-cooled condensing units; maintain required access to unit. Install furnished field-mounted accessories. Refrigerant piping and specialties are specified in Section 23 23 00 – Refrigerant Piping.

E. Ground equipment according to Division 26 Section "Grounding and Bonding."

F. Connect wiring according to Division 26 Section "Conductors and Cables."

3.4 FIELD QUALITY CONTROL

A. Perform the following field tests and inspections and prepare test reports:

1. Perform electrical test and visual and mechanical inspection.

2. Leak Test: After installation, charge systems with refrigerant and oil and test for leaks. Repair leaks, replace lost refrigerant and oil, and retest until no leaks exist.

3. Operational Test: After electrical circuitry has been energized, start units to confirm proper operation, product capability, and compliance with requirements.

4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

5. Verify proper airflow over coils.

B. Verify that vibration isolation and flexible connections properly dampen vibration transmission to structure.

C. Remove and replace malfunctioning condensing units and retest as specified above.

3.5 STARTUP SERVICE

A. Complete installation and startup checks according to manufacturer's written instructions and perform the following:

1. Inspect for physical damage to unit casing.

2. Verify that access doors move freely and are weather tight.

3. Clean units and inspect for construction debris.

4. Verify that all bolts and screws are tight.

5. Adjust vibration isolation and flexible connections.

6. Verify that controls are connected and operational.

B. Lubricate bearings on fans.

C. Verify that fan wheel is rotating in the correct direction and is not vibrating or binding.

D. Start unit according to manufacturer's written instructions and complete manufacturer's startup checklist.

E. Measure and record airflow over coils.

F. Verify proper operation of condenser capacity control device.

G. Verify that vibration isolation and flexible connections properly dampen vibration transmission to structure.

H. After startup and performance test, lubricate bearings.

3.6 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain condensing units. 01 78 00 Closeout Submittals.

B. Refer Division 01 for administrative and procedural requirements for demonstration and training

END OF SECTION 23 73 14

SECTION 23 74 13 - PACKAGED, OUTDOOR, CENTRAL-STATION AIR-HANDLING UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes packaged, outdoor, central-station air-handling units (rooftop units) with the following components and accessories:

1. Direct-expansion cooling.
2. Hot-gas reheat.
3. Gas furnace.
4. Economizer outdoor- and return-air damper section.
5. Roof curbs.

B. Related Sections include the following:

1. Section 237333.16 "Indoor, Indirect, Gas-Fired Heating and Ventilating Units" for outdoor units providing 100 percent tempered outdoor air with heat exchangers.
2. Section 237339 "Indoor, Direct-Fired Heating and Ventilating Units" for outdoor units providing 100 percent tempered outdoor air without heat exchangers.
3. Section 237433 "Dedicated Outdoor-Air Units" for outdoor equipment air conditioning 100 percent outdoor air to replace air exhausted from a building.
4. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
5. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 DEFINITIONS

A. DDC: Direct-digital controls.

B. ECM: Electrically commutated motor.

C. Outdoor-Air Refrigerant Coil: Refrigerant coil in the outdoor-air stream to reject heat during cooling operations and to absorb heat during heating operations. "Outdoor air" is defined as the air outside the building or taken from outdoors and not previously circulated through the system.

D. Outdoor-Air Refrigerant-Coil Fan: The outdoor-air refrigerant-coil fan in RTUs. "Outdoor air" is defined as the air outside the building or taken from outdoors and not previously circulated through the system.

E. RTU: Rooftop unit. As used in this Section, this abbreviation means packaged, outdoor, central-station air-handling units. This abbreviation is used regardless of whether the unit is mounted on the roof or on a concrete base on ground.

F. Supply-Air Fan: The fan providing supply air to conditioned space. "Supply air" is defined as the air entering a space from air-conditioning, heating, or ventilating apparatus.

G. Supply-Air Refrigerant Coil: Refrigerant coil in the supply-air stream to absorb heat (provide cooling) during cooling operations and to reject heat (provide heating) during heating operations. "Supply air" is defined as the air entering a space from air-conditioning, heating, or ventilating apparatus.

H. VVT: Variable-air volume and temperature.

1.4 ACTION SUBMITTALS

A. Product Data: Include manufacturer's technical data for each RTU, including rated capacities, dimensions, required clearances, characteristics, furnished specialties, and accessories.

B. LEED Submittals:

1. Product Data for Credit EA 4: Documentation indicating that equipment and refrigerants comply.
2. Product Data for Prerequisite IEQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."

C. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

1. Wiring Diagrams: Power, signal, and control wiring.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Plans and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Structural members to which RTUs will be attached.
2. Roof openings
3. Roof curbs and flashing.

B. Field quality-control test reports.

C. Warranty: Special warranty specified in this Section.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For RTUs to include in emergency, operation, and maintenance manuals.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fan Belts: Two sets for each belt-driven fan.
2. Filters: Two sets of filters for each unit.

B. Other spare parts: Manufacturer's recommended quantity, but not less than 10% of all replacement parts, with a minimum quantity of one each.

1.8 QUALITY ASSURANCE

A. ARI Compliance:

1. Comply with ARI 203/110 and ARI 303/110 for testing and rating energy efficiencies for RTUs.
2. Comply with ARI 270 for testing and rating sound performance for RTUs.

B. ASHRAE Compliance:

1. Comply with ASHRAE 15 for refrigeration system safety.
2. Comply with ASHRAE 33 for methods of testing cooling and heating coils.
3. Comply with applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."

C. ASHRAE/IESNA 90.1 Compliance: Applicable requirements in ASHRAE/IESNA 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."

D. NFPA Compliance: Comply with NFPA 90A and NFPA 90B.

E. UL Compliance: Comply with UL 1995.

F. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.9 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to replace components of RTUs that fail in materials or workmanship within specified warranty period.

1. Warranty Period for Compressors: Not less than 10 years from date of Substantial Completion.
2. Warranty Period for Gas Furnace Heat Exchangers: Not less than 10 years from date of Substantial Completion.
3. Warranty Period for Solid-State Ignition Modules: Manufacturer's standard, but not less than three years from date of Substantial Completion.
4. Warranty Period for Control Boards: Manufacturer's standard, but not less than three years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. AAON
   2. Carrier Corporation
   3. Trane
   4. York

2.2 CASING

A. General Fabrication Requirements for Casings: Formed and reinforced double-wall insulated panels, fabricated to allow removal for access to internal parts and components, with joints between sections sealed.

B. Exterior Casing Material: Galvanized steel with factory-painted finish, with pitched roof panels and knockouts with grommet seals for electrical and piping connections and lifting lugs.

   1. Exterior Casing Thickness: 0.052 inch thick.

C. Inner Casing Fabrication Requirements:

   1. Inside Casing: Galvanized steel, 0.034 inch thick.

D. Casing Insulation and Adhesive: Comply with NFPA 90A or NFPA 90B.

   1. Materials: ASTM C 1071, Type I.
   2. Thickness: 1/2 inch.
   3. Liner materials shall have air-stream surface coated with an erosion- and temperature-resistant coating or faced with a plain or coated fibrous mat or fabric.
   4. Liner Adhesive: Comply with ASTM C 916, Type I.

E. Condensate Drain Pans: Formed sections of stainless-steel sheet, a minimum of 2 inches deep, and complying with ASHRAE 62.1.

   1. Double-Wall Construction: Fill space between walls with foam insulation and seal moisture tight.
   2. Drain Connections: Threaded nipple both sides of drain pan.
   3. Pan-Top Surface Coating: Corrosion-resistant compound.

F. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.

2.3 FANS

A. Direct-Driven Supply-Air Fans: Double width, backward inclined, centrifugal; with permanently lubricated, ECM motor resiliently mounted in the fan inlet. Aluminum or painted-steel wheels, and galvanized- or painted-steel fan scrolls.

B. Belt-Driven Supply-Air Fans: Double width, forward curved, centrifugal; with permanently lubricated, single-speed motor installed on an adjustable fan base resiliently mounted in the casing. Aluminum or painted-steel wheels, and galvanized- or painted-steel fan scrolls.

C. Condenser-Coil Fan: Propeller, mounted on shaft of permanently lubricated motor.

D. Relief-Air Fan: Propeller, shaft mounted on permanently lubricated motor.

E. Fan Motor: Comply with requirements in Section 230513 "Common Motor Requirements for HVAC Equipment."

2.4 COILS

A. Supply-Air Refrigerant Coil:

1. Aluminum-plate fin and seamless copper tube in steel casing with equalizing-type vertical distributor.
2. Polymer strip shall prevent all copper coil from contacting steel coil frame or condensate pan.
3. Coil Split: Interlaced.
4. Condensate Drain Pan: Stainless steel]formed with pitch and drain connections complying with ASHRAE 62.1.

B. Outdoor-Air Refrigerant Coil:

1. Aluminum-plate fin and seamless internally grooved copper tube in steel casing with equalizing-type vertical distributor.
2. Polymer strip shall prevent all copper coil from contacting steel coil frame or condensate pan.

C. Hot-Gas Reheat Refrigerant Coil:

1. Aluminum-plate fin and seamless internally grooved copper tube in steel casing with equalizing-type vertical distributor.
2. Polymer strip shall prevent all copper coil from contacting steel coil frame or condensate pan.

2.5 REFRIGERANT CIRCUIT COMPONENTS

A. Number of Refrigerant Circuits: As indicated on drawings.

B. Compressor: Hermetic, scroll, mounted on vibration isolators; with internal overcurrent and high-temperature protection, internal pressure relief, and crankcase heater.

C. Refrigeration Specialties:

1. Refrigerant: R-410A.
2. Expansion valve with replaceable thermostatic element.
3. Refrigerant filter/dryer.
4. Manual-reset high-pressure safety switch.
5. Automatic-reset low-pressure safety switch.
6. Minimum off-time relay.
7. Automatic-reset compressor motor thermal overload.

8. Brass service valves installed in compressor suction and liquid lines.
9. Low-ambient kit high-pressure sensor.
10. Hot-gas reheat solenoid valve with a replaceable magnetic coil.
11. Hot-gas bypass solenoid valve with a replaceable magnetic coil.
12. Four-way reversing valve with a replaceable magnetic coil, thermostatic expansion valves with bypass check valves, and a suction line accumulator.

2.6 AIR FILTRATION

A. Minimum arrestance according to ASHRAE 52.1, and a minimum efficiency reporting value (MERV) according to ASHRAE 52.2.

1. Glass Fiber: Minimum 80 percent arrestance, and MERV 5.

2.7 GAS FURNACE

A. Description: Factory assembled, piped, and wired; complying with ANSI Z21.47 and NFPA 54.

1. CSA Approval: Designed and certified by and bearing label of CSA.

B. Burners: Stainless steel.

1. Fuel: Natural gas.
2. Ignition: Electronically controlled electric spark or hot-surface igniter with flame sensor.

C. Heat-Exchanger and Drain Pan: Stainless steel.

D. Power Vent: Integral, motorized centrifugal fan interlocked with gas valve with vertical extension.

E. Safety Controls:

1. Gas Control Valve: Modulating.
2. Gas Train: Single-body, regulated, redundant, 24-V ac gas valve assembly containing pilot solenoid valve, pilot filter, pressure regulator, pilot shutoff, and manual shutoff.

2.8 DAMPERS

A. Outdoor-Air Damper: Linked damper blades, for 0 to 100 percent outdoor air, with motorized damper filter.

B. Outdoor- and Return-Air Mixing Dampers: Parallel- or opposed-blade galvanized-steel dampers mechanically fastened to cadmium plated for galvanized-steel operating rod in reinforced cabinet. Connect operating rods with common linkage and interconnect linkages so dampers operate simultaneously.

1. Damper Motor: Modulating with adjustable minimum position.
2. Relief-Air Damper: Gravity actuated or motorized, as required by ASHRAE/IESNA 90.1, with bird screen and hood.

2.9 ELECTRICAL POWER CONNECTION

A. Provide for single connection of power to unit with unit-mounted disconnect switch accessible from outside unit and control-circuit transformer with built-in overcurrent protection.

2.10 CONTROLS

A. Control equipment are specified in Section 230923 "Direct Digital Control (DDC) System for HVAC" and sequence of operation are specified on drawings.

B. DDC Controller:

1. Controller shall have volatile-memory backup.
2. Safety Control Operation:

    a. Smoke Detectors: Stop fan and close outdoor-air damper if smoke is detected. Provide additional contacts for alarm interface to fire alarm control panel.
    b. Firestats: Stop fan and close outdoor-air damper if air greater than 130 deg F enters unit. Provide additional contacts for alarm interface to fire alarm control panel.
    c. Fire Alarm Control Panel Interface: Provide control interface to coordinate with operating sequence described in Section 283111 "Digital, Addressable Fire-Alarm System"
    d. Low-Discharge Temperature: Stop fan and close outdoor-air damper if supply air temperature is less than 40 deg F.
    e. Defrost Control for Condenser Coil: Pressure differential switch to initiate defrost sequence.

C. Interface Requirements for HVAC Instrumentation and Control System:

1. Interface relay for scheduled operation.
2. Interface relay to provide indication of fault at the central workstation and diagnostic code storage.
3. Provide BACnet or LonWorks compatible interface for central HVAC control workstation for the following:

    a. Adjusting set points.
    b. Monitoring supply fan start, stop, and operation.
    c. Inquiring data to include outdoor-air damper position, supply- and room-air temperature and humidity.
    d. Monitoring occupied and unoccupied operations.
    e. Monitoring constant and variable motor loads.
    f. Monitoring variable-frequency drive operation.
    g. Monitoring cooling load.
    h. Monitoring economizer cycles.
    i. Monitoring air-distribution static pressure and ventilation air volume.

2.11 ACCESSORIES

A. Electric heater with integral thermostat maintains minimum 50 deg F temperature in gas burner compartment.

B. Duplex, 115-V, ground-fault-interrupter outlet with 15-A overcurrent protection. Include transformer if required. Outlet shall be energized even if the unit main disconnect is open.

C. Low-ambient kit using staged condenser fans for operation down to 35 deg F.

D. Filter differential pressure switch with sensor tubing on either side of filter. Set for final filter pressure loss.

E. Coil guards of painted, galvanized-steel wire.

F. Hail guards of galvanized steel, painted to match casing.

G. Concentric diffuser with white louvers and polished aluminum return grilles, insulated diffuser box with mounting flanges, and interior transition.

2.12 ROOF CURBS

A. Materials: Galvanized steel with corrosion-protection coating, watertight gaskets, and factory-installed wood nailer; complying with NRCA standards.

1. Curb Insulation and Adhesive: Comply with NFPA 90A or NFPA 90B.

a. Materials: ASTM C 1071, Type I or II.
b. Thickness: 1 inch.

2. Application: Factory applied with adhesive and mechanical fasteners to the internal surface of curb.

a. Liner Adhesive: Comply with ASTM C 916, Type I.
b. Mechanical Fasteners: Galvanized steel, suitable for adhesive attachment, mechanical attachment, or welding attachment to duct without damaging liner when applied as recommended by manufacturer and without causing leakage in cabinet.
c. Liner materials applied in this location shall have air-stream surface coated with a temperature-resistant coating or faced with a plain or coated fibrous mat or fabric depending on service air velocity.
d. Liner Adhesive: Comply with ASTM C 916, Type I.

B. Curb Height: 14 inches.

2.13 CAPACITIES AND CHARACTERISTICS

A. Capacities and characteristics: As shown on drawings.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of RTUs.

B. Examine roughing-in for RTUs to verify actual locations of piping and duct connections before equipment installation.

C. Examine roofs for suitable conditions where RTUs will be installed.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Roof Curb: Install on roof structure level and secure, according to NRCA's "Low-Slope Membrane Roofing Construction Details Manual," Illustration "Raised Curb Detail for Rooftop Air Handling Units and Ducts." Install RTUs on curbs and coordinate roof penetrations and flashing with roof construction specified in Section 077200 "Roof Accessories." Secure RTUs to upper curb rail, and secure curb base to roof framing or concrete base with anchor bolts.

3.3 CONNECTIONS

A. Install condensate drain, minimum connection size, with trap and indirect connection to nearest roof drain or area drain.

B. Install piping adjacent to RTUs to allow service and maintenance.

1. Gas Piping: Comply with applicable requirements in Section 231123 "Facility Natural-Gas Piping." Connect gas piping to burner, full size of gas train inlet, and connect with union and shutoff valve with sufficient clearance for burner removal and service.

C. Duct installation requirements are specified in other HVAC Sections. Drawings indicate the general arrangement of ducts. The following are specific connection requirements:

1. Install ducts to termination at top of roof curb.
2. Remove roof decking only as required for passage of ducts. Do not cut out decking under entire roof curb.
3. Connect supply ducts to RTUs with flexible duct connectors specified in Section 233300 "Air Duct Accessories."
4. Install return-air duct continuously through roof structure.
5. Install normal-weight, 3000-psi, compressive strength (28-day) concrete mix inside roof curb, 4 inches thick. Concrete, formwork, and reinforcement are specified with concrete.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections. Report results in writing.

B. Perform tests and inspections and prepare test reports.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing. Report results in writing.

C. Tests and Inspections:

1. After installing RTUs and after electrical circuitry has been energized, test units for compliance with requirements.
2. Inspect for and remove shipping bolts, blocks, and tie-down straps.
3. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

D. Remove and replace malfunctioning units and retest as specified above.

3.5 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

B. Complete installation and startup checks according to manufacturer's written instructions and do the following:

1. Inspect for visible damage to unit casing.
2. Inspect for visible damage to furnace combustion chamber.
3. Inspect for visible damage to compressor, coils, and fans.
4. Inspect internal insulation.
5. Verify that labels are clearly visible.
6. Verify that clearances have been provided for servicing.
7. Verify that controls are connected and operable.
8. Verify that filters are installed.
9. Clean condenser coil and inspect for construction debris.
10. Clean furnace flue and inspect for construction debris.
11. Connect and purge gas line.
12. Remove packing from vibration isolators.
13. Inspect operation of barometric relief dampers.
14. Verify lubrication on fan and motor bearings.
15. Inspect fan-wheel rotation for movement in correct direction without vibration and binding.
16. Adjust fan belts to proper alignment and tension.
17. Start unit according to manufacturer's written instructions.

    a. Start refrigeration system.
    b. Do not operate below recommended low-ambient temperature.
    c. Complete startup sheets and attach copy with Contractor's startup report.

18. Inspect and record performance of interlocks and protective devices; verify sequences.
19. Operate unit for an initial period as recommended or required by manufacturer.
20. Perform the following operations for both minimum and maximum firing. Adjust burner for peak efficiency.

    a. Measure gas pressure on manifold.
    b. Inspect operation of power vents.
    c. Measure combustion-air temperature at inlet to combustion chamber.
    d. Measure flue-gas temperature at furnace discharge.
    e. Perform flue-gas analysis. Measure and record flue-gas carbon dioxide and oxygen concentration.
    f. Measure supply-air temperature and volume when burner is at maximum firing rate and when burner is off. Calculate useful heat to supply air.

21. Calibrate thermostats.

22. Adjust and inspect high-temperature limits.
23. Inspect outdoor-air dampers for proper stroke and interlock with return-air dampers.
24. Start refrigeration system and measure and record the following when ambient is a minimum of 15 deg F above return-air temperature:

    a. Coil leaving-air, dry- and wet-bulb temperatures.
    b. Coil entering-air, dry- and wet-bulb temperatures.
    c. Outdoor-air, dry-bulb temperature.
    d. Outdoor-air-coil, discharge-air, dry-bulb temperature.

25. Inspect controls for correct sequencing of heating, mixing dampers, refrigeration, and normal and emergency shutdown.
26. Measure and record the following minimum and maximum airflows. Plot fan volumes on fan curve.

    a. Supply-air volume.
    b. Return-air volume.
    c. Relief-air volume.
    d. Outdoor-air intake volume.

27. Simulate maximum cooling demand and inspect the following:

    a. Compressor refrigerant suction and hot-gas pressures.
    b. Short circuiting of air through condenser coil or from condenser fans to outdoor-air intake.

28. Verify operation of remote panel including pilot-light operation and failure modes. Inspect the following:

    a. High-temperature limit on gas-fired heat exchanger.
    b. Low-temperature safety operation.
    c. Filter high-pressure differential alarm.
    d. Economizer to minimum outdoor-air changeover.
    e. Relief-air fan operation.
    f. Smoke and firestat alarms.

29. After startup and performance testing and prior to Substantial Completion, replace existing filters with new filters.

3.6 CLEANING AND ADJUSTING

A. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to site during other-than-normal occupancy hours for this purpose.

B. After completing system installation and testing, adjusting, and balancing RTU and air-distribution systems, clean filter housings and install new filters.

3.7 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain RTUs.

B. Refer Division 01 for administrative and procedural requirements for demonstration and training

END OF SECTION 23 74 13

SECTION 23 74 23.16 - PACKAGED, INDIRECT-FIRED, OUTDOOR, HEATING-ONLY MAKEUP-AIR UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes indirect-fired makeup-air units.

B. Related Requirements:
1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 DEFINITIONS

A. DDC: Direct digital control.

1.4 ACTION SUBMITTALS

A. Product Data: For each type and configuration of outdoor, indirect-fired makeup-air unit.

1. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

B. LEED Submittals:

1. Product Data for Prerequisite IEQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."

C. Shop Drawings: For each type and configuration of outdoor, indirect-fired heating and ventilating unit.

1. Signed, sealed, and prepared by or under the supervision of a qualified professional engineer.
2. Include plans, elevations, sections, and mounting details.
3. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
4. Detail fabrication and assembly of gas-fired heating and ventilating units, as well as procedures and diagrams.
5. Include diagrams for power, signal, and control wiring.

1.5 INFORMATIONAL SUBMITTALS

A. Startup service reports.

B. Sample Warranty: For manufacturer's special warranty.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For indirect-fired makeup-air units to include in emergency, operation, and maintenance manuals.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Filters: Two sets for each unit.
2. Fan Belts: Two sets for each unit.

B. Other spare parts: Manufacturer’s recommended quantity, but not less than 10% of all replacement parts, with a minimum quantity of one each.

1.8 QUALITY ASSURANCE

A. Comply with NFPA 70.

B. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."

C. ASHRAE/IES 90.1 Compliance: Applicable requirements in ASHRAE/IES 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."

1.9 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of indirect-fired heating and ventilating units that fail in materials or workmanship within specified warranty period.

1. Warranty Period for Heat Exchangers: Manufacturer's standard, but not less than 10 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Captive Air Systems

2. Engineered Air

3. Greenheck Fan Corporation.

4. Or approved equal.

2.2 SYSTEM DESCRIPTION

A. Factory-assembled, prewired, self-contained unit consisting of cabinet, supply fan, controls, filters, and indirect-fired gas burner to be installed exterior to the building.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.3 UNIT CASINGS

A. General Fabrication Requirements for Casings:

1. Forming: Form walls, roofs, and floors with at least two breaks at each joint.
2. Casing Joints: Sheet metal screws or pop rivets, factory sealed with water-resistant sealant.
3. Factory Finish for Galvanized-Steel Casings: Apply manufacturer's standard primer immediately after cleaning and pretreating.
4. Air-Handling-Unit Mounting Frame: Formed galvanized-steel channel or structural channel supports, designed for low deflection, welded with integral lifting lugs.

5. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.

B. Configuration: Horizontal unit with bottom discharge for roof-mounting installation.

C. Cabinet: Galvanized-steel panels, formed to ensure rigidity and supported by galvanized-steel channels or structural channel supports with lifting lugs. Duct flanges at inlet and outlet. Pitched roof panels and knockouts with grommet seals for electrical and piping connections and lifting lugs.

D. Inner Casing:

1. Burner Section Inner Casing: 0.0299-inch- thick steel.

2. Internal Insulation: Fibrous-glass duct lining, neoprene coated, comply with ASTM C 1071, Type II, applied on burner and fan sections only.

a. Thickness: 1 inch.
b. Insulation Adhesive: Comply with ASTM C 916, Type I.
c. Density: 1.5 lb/cu. ft..
d. Mechanical Fasteners: Galvanized steel suitable for adhesive, mechanical, or welding attachment to casing without damaging liner when applied as recommended by manufacturer and without causing air leakage.

E. Inspection and Access Panels and Access Doors:
1. Inspection and Access Panels:

a. Fasteners: Two or more camlock type for panel lift-out operation. Arrangement shall allow panels to be opened against air-pressure differential.
b. Gasket: Neoprene, applied around entire perimeters of panel frames.
c. Size: Large enough to allow inspection and maintenance of air-handling unit's internal components.

2. Locations and Applications:

a. Fan Section: Inspection and access panels.
b. Access Section: Doors.
c. Coil Section: Inspection and access panels.
d. Damper Section: Inspection and access panels.
e. Filter Section: Inspection and access panels large enough to allow periodic removal and installation of filters.
f. Mixing Section: Doors.

2.4 ACCESSORIES

A. Duplex, 115-V, ground-fault-interrupter outlet with 15-A overcurrent protection. Include transformer if required. Outlet shall be energized even if the unit main disconnect is open.

B. Filter differential pressure switch with sensor tubing on either side of filter. Set for final filter pressure loss.

C. Coil guards of painted, galvanized-steel wire.

D. Hail guards of galvanized steel, painted to match casing.

2.5 OUTDOOR-AIR INTAKE HOOD

A. Type: Manufacturer's standard hood or louver.

B. Materials: Match cabinet.

C. Bird Screen: Comply with requirements in ASHRAE 62.1.

D. Filter: Aluminum, 1 inch cleanable.

E. Configuration: Designed to inhibit wind-driven rain and snow from entering unit.

2.6 ROOF CURBS

A. Materials: Galvanized steel with corrosion-protection coating, watertight gaskets, and factory-installed wood nailer; complying with NRCA standards.

B. Curb Height: 14 inches.

2.7 SUPPLY-AIR FAN

A. Fan Type: Double width, double inlet, centrifugal, rated according to AMCA 210; statically and dynamically balanced, galvanized steel; mounted on solid-steel shaft with heavy-duty[, self-aligning, permanently lubricated ball bearings. Bearing rating: L10 of 100,000 hours.

B. Drive: V-belt drive with matching fan pulley and adjustable motor sheaves and belt assembly.

C. Mounting: Fan wheel, motor, and drives shall be mounted in fan casing with spring isolators.

D. Fan-Shaft Lubrication Lines: Extended to a location outside the casing.

2.8 AIR FILTERS

A. Comply with NFPA 90A.

B. Cleanable Filters: Cleanable metal mesh.

1. Thickness: 1 inch.

2.9 DAMPERS

A. Outdoor-Air Damper: Galvanized-steel, opposed-blade dampers with vinyl blade seals and stainless-steel jamb seals, having a maximum leakage of 10 cfm/sq. ft. of damper area, at a differential pressure of 2-inch wg.

B. Damper Operator: Direct coupled, electronic with spring return or fully modulating as required by the control sequence.

2.10 INDIRECT-FIRED GAS BURNER

A. Description: Factory assembled, piped, and wired; and complying with ANSI Z21.47, "Gas-Fired Central Furnaces," and with NFPA 54, "National Fuel Gas Code."

1. CSA Approval: Designed and certified by and bearing label of CSA.
2. Burners: Stainless steel.

a. Gas Control Valve: Modulating.
b. Fuel: Natural gas.
c. Minimum Combustion Efficiency: 80 percent.
d. Ignition: Electronically controlled electric spark with flame sensor.

B. Venting: Power vented, with integral, motorized centrifugal fan interlocked with gas valve.

C. Combustion-Air Intake: Separate combustion-air intake and vent terminal assembly.

D. Heat Exchanger: Stainless steel.

E. Safety Controls:

1. Vent Flow Verification: Differential pressure switch to verify open vent.
2. Control Transformer: 24-V ac.

3. High Limit: Thermal switch or fuse to stop burner.
4. Gas Train: Regulated, redundant, 24-V ac gas valve assembly containing pilot solenoid valve, electronic-modulating temperature control valve, pilot filter, pressure regulator, pilot shutoff, and manual shutoff all in one body.
5. Purge-period timer shall automatically delay burner ignition and bypass low-limit control.
6. Gas Manifold: Safety switches and controls complying with ANSI standards.
7. Airflow Proving Switch: Differential pressure switch senses correct airflow before energizing pilot.
8. Automatic-Reset, High-Limit Control Device: Stops burner and closes main gas valve if high-limit temperature is exceeded.
9. Safety Lockout Switch: Locks out ignition sequence if burner fails to light after three tries. Controls are reset manually by turning the unit off and on.

2.11 UNIT CONTROL PANEL

A. Factory-wired, fuse-protected control transformer, connection for power supply and field-wired unit to remote control panel.

B. Control Panel: Recessed, with trim ring, remote panel, with engraved plastic cover and the following lights and switches:

1. On-off fan switch.
2. Heat-vent-off switch.
3. Supply-fan operation indicating light.
4. Heating operation indicating light.
5. Thermostat.
6. Damper position potentiometer.
7. Dirty-filter indicating light operated by unit-mounted differential pressure switch.
8. Safety-lockout indicating light.
9. Enclosure: NEMA 250, Type 1.

2.12 CONTROLS

A. Comply with requirements in Section 230923 "Direct Digital Control (DDC) System for HVAC" for control equipment, and drawings for sequence of operation.

B. Fan Control: Interlock fan to start with exhaust fan to which this heating and ventilating unit is associated for makeup air.

1. Smoke detectors, located in supply air, shall stop fans when the presence of smoke is detected.

C. Outdoor-Air Damper Control, 100 Percent Outdoor-Air Units: Outdoor-air damper shall open when supply fan starts, and close when fan stops.

D. Temperature Control:

1. Operates gas valve to maintain discharge-air temperature with factory-mounted sensor in blower outlet.
2. Burner Control: 20 to 100 percent modulation of the firing rate.

E. Interface with DDC System for HVAC: Factory-installed hardware and software to enable the DDC system for HVAC to monitor, control, and display status and alarms of heating and ventilating unit.

1. Hardwired Points:
   a. Discharge-air temperature.
   b. Burner operating.

2.13 MOTORS

A. Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."

1. Enclosure: Totally enclosed, air over.
2. Enclosure Materials: Cast iron.
3. Motor Bearings: Heavy Duty, permanently lubricated.

4. Efficiency: Premium efficient.

2.14 CAPACITIES AND CHARACTERISTICS

A. Capacity and characteristics:

1. As indicated on drawings.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for piping, ducts, and electrical systems to verify actual locations of connections before equipment installation.

C. Verify cleanliness of airflow path to include inner-casing surfaces, filters, coils, turning vanes, fan wheels, and other components.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Unit Support: Install heating and ventilating unit level on supplied roof curbs. Coordinate all roof penetrations and flashing with roof construction.

B. Install gas-fired units according to NFPA 54, "National Fuel Gas Code."

C. Install controls and equipment shipped by manufacturer for field installation with indirect-fired heating and ventilating units.

D. Roof Curb: Install on roof structure, level and secure, according to NRCA's "Low-Slope Membrane Roofing Construction Details Manual," Illustration "Raised Curb Detail for Rooftop Air Handling Units and Ducts." Secure units to upper curb rail, and secure curb base to roof framing or concrete base with anchor bolts.

3.3 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

1. Gas Piping: Comply with requirements in Section 231123 "Facility Natural-Gas Piping." Connect gas piping with shutoff valve and union, and with sufficient clearance for burner removal and service. Make final connections of gas piping to unit with corrugated, stainless-steel tubing flexible connectors complying with ANSI LC 1/CSA 6.26 equipment connections.

B. Duct Connections: Connect supply ducts to indirect-fired heating and ventilating units with flexible duct connectors. Comply with requirements in Section 233300 "Air Duct Accessories" for flexible duct connectors.

C. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."

D. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Perform tests and inspections with the assistance of a factory-authorized service representative.

C. Units will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

3.5 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

B. Complete installation according to manufacturer's written instructions and perform the following:

1. Inspect for visible damage to burner combustion chamber.
2. Inspect casing insulation for integrity, moisture content, and adhesion.
3. Verify that clearances have been provided for servicing.
4. Verify that controls are connected and operable.
5. Verify that filters are installed.
6. Purge gas line.
7. Inspect and adjust vibration isolators.
8. Verify bearing lubrication.
9. Inspect fan-wheel rotation for movement in correct direction without vibration and binding.
10. Adjust fan belts to proper alignment and tension.

3.6 ADJUSTING

A. Adjust initial temperature set points.

B. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

C. Occupancy Adjustments: When requested within 24 months from date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

3.7 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain heating and ventilating units.

B. Refer Division 01 for administrative and procedural requirements for demonstration and training.

END OF SECTION 23 74 23.16

SECTION 23 74 33 - DEDICATED OUTDOOR-AIR UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes factory-packaged units capable of supplying up to 100 percent outdoor air and providing cooling and heating.

B. Related Sections include the following:
   1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
   2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product. Include rated capacities, operating characteristics, and furnished specialties and accessories.

B. LEED Submittals:

   1. Product Data for Prerequisite EA 2: Documentation indicating that units comply with applicable requirements in ASHRAE/IESNA 90.1.
   2. Product Data for Prerequisite EA 3: Documentation indicating that refrigerants comply.
   3. Product Data for Credit EA 4: Documentation indicating that equipment and refrigerants comply.
   4. Product Data for Prerequisite IEQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."
   5. Product Data for Credit IEQ 1: Documentation indicating that units are equipped with a direct outdoor airflow-measuring device capable of measuring the minimum outdoor airflow with accuracy within 15 percent of the design minimum airflow rate, as defined by ASHRAE 62.1.
   6. Product Data for Credit IEQ 4.1: For solvent cements and adhesive primers, documentation including printed statement of VOC content.
   7. Laboratory Test Reports for Credit IEQ 4: For solvent cements and adhesive primers, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
   8. Product Data for Credit IEQ 5: Documentation indicating that units include MERV 13 filters rated according to ASHRAE 52.2.

C. Shop Drawings:

1. Include plans, elevations, sections, and attachment details.
2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Roof-curb mounting details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Size and location of unit-mounted rails and anchor points and methods for anchoring units to roof curb.
2. Required roof penetrations for ducts, pipes, and electrical raceways, including size and location of each penetration.

B. Startup service reports.

C. Sample Warranty: For special warranty.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For units to include in emergency, operation, and maintenance manuals.

1.6 MAINTENANCE SPARE PARTS

A. Belts: Two sets for each belt-driven unit.

B. Filters: Two sets for each unit.

C. Other spare parts: Manufacturer's recommended quantity, but not less than 10% of all replacement parts, with a minimum quantity of one each.

1.7 WARRANTY

A. Special Warranty: Manufacturer agrees to replace components of units that fail in materials or workmanship within specified warranty period.

1. Warranty Period for Compressors: Five years from date of Substantial Completion.
2. Warranty Period for Heat Exchangers: 10 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. AAON

2. Carrier Corporation
3. Trane
4. York

2.2 PERFORMANCE REQUIREMENTS

A. General Fabrication Requirements: Comply with requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment," and Section 7 - "Construction and System Start-up."

B. Cabinet Thermal Performance:

1. Maximum Overall U-Value: Comply with requirements in ASHRAE/IESNA 90.1.

C. Cabinet Surface Condensation:

1. Cabinet shall have additional insulation and vapor seals if required to prevent condensation on the interior and exterior of the cabinet.
2. Portions of cabinet located downstream from the cooling coil shall have a thermal break at each thermal bridge between the exterior and interior casing to prevent condensation from occurring on the interior and exterior surfaces. The thermal break shall not compromise the structural integrity of the cabinet.

D. Maximum Cabinet Leakage: 0.5 percent of the total supply-air flow at a pressure rating equal to the fan shut-off pressure.

E. Cabinet Deflection Performance:

1. Walls and roof deflection shall be within 1/200 of the span at the design working pressure equal to the fan shut-off pressure. Deflection limits shall be measured at any point on the surface.
2. Floor deflections shall be within 1/240 of the span considering the worst-case condition caused by the following:

a. Service personnel.
b. Internal components.
c. Design working pressure defined for the walls and roof.

F. Electrical components, devices, and accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

G. Capacities and Characteristics: As shown on drawings.

2.3 CABINET

A. Construction: Double wall.

B. Exterior Casing Material: Galvanized steel with paint finish.

C. Interior Casing Material: Galvanized.

D. Lifting and Handling Provisions: Factory-installed shipping skids and lifting lugs.

E. Base Rails: Galvanized -steel rails for mounting on roof curb or pad as indicated.

F. Access for Inspection, Cleaning, and Maintenance: Comply with requirements in ASHRAE 62.1.

1. Service Doors: Hinged access doors with gaskets. Material and construction of doors shall match material and construction of cabinet in which doors are installed.

G. Roof: Standing seam or membrane; sloped to drain water.

H. Floor: Reinforced, metal surface; reinforced to limit deflection when walked on by service personnel. Insulation shall be below metal walking surface.

I. Cabinet Insulation:

1. Type: Foam insulation.
2. Thickness: 1 inch.
3. Insulation Adhesive: Comply with ASTM C 916, Type I.
4. Mechanical Fasteners: Suitable for adhesive, mechanical, or welding attachment to casing without damaging liner and without causing air leakage when applied as recommended by manufacturer.

J. Condensate Drain Pans:

1. Shape: Rectangular, with 2 percent slope in at least two planes to direct water toward drain connection.
2. Size: Large enough to collect condensate from cooling coils including coil piping connections, coil headers, and return bends.
    a. Length: Extend drain pan downstream from leaving face to comply with ASHRAE 62.1.
    b. Depth: A minimum of 2 inches deep.
3. Configuration: Double wall, with space between walls filled with foam insulation and moisture-tight seal.
4. Material: Stainless-steel sheet.
5. Drain Connection:
    a. Located on both ends of pan, at lowest point of pan.
    b. Terminated with threaded nipple.
    c. Minimum Connection Size: NPS 1.
6. Units with stacked coils shall have an intermediate drain pan to collect condensate from top coil.

K. Surfaces in Contact with Airstream: Comply with requirements in ASHRAE 62.1 for resistance to mold and erosion.

L. Roof Curb: Full-perimeter curb of sheet metal, minimum 12 inches high, with wood nailer, neoprene sealing strip, and welded Z-bar flashing.

1. Comply with requirements in "The NRCA Roofing Manual."

2.4 SUPPLY FAN

A. Plenum Fan Type: Direct drive, single width, non-overloading, with backward-inclined or airfoil blades.

1. Fan Wheel Material: Aluminum; attached directly to motor shaft.
2. Fan Wheel Drive and Arrangement: Direct drive, AMCA Arrangement 4.
3. Fan panel and frame Material: Powder-coated steel, stainless steel, or aluminum.
4. Fan Enclosure: Easily removable enclosure around rotating parts.
5. Fan Balance: Precision balance fan below 0.08 inch/s at design speed with filter in.

B. Motors:

1. Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
2. Enclosure: Totally enclosed.
3. Enclosure Materials: Cast iron.
4. Motor Bearings: Rated for 200,000 hours with external lubrication connections.

5. Efficiency: Premium efficient.
6. Service Factor: 1.15.
7. Speed Control: Variable Frequency Drive

C. Mounting: Fan wheel, motor, and drives shall be mounted to fan casing with elastomeric isolators.

2.5 RETURN/EXHAUST FAN

A. Plenum Fan Type: Direct drive, single width, non-overloading, with backward-inclined or airfoil blades.

1. Fan Wheel Material: Aluminum; attached directly to motor shaft.
2. Fan Wheel Drive and Arrangement: Direct drive, AMCA Arrangement 4.
3. Fan panel and frame Material: Powder-coated steel, stainless steel, or aluminum.
4. Fan Enclosure: Easily removable enclosure around rotating parts.
5. Fan Balance: Precision balance fan below 0.08 inch/s at design speed with filter in.

B. Motors:

1. Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
2. Enclosure: Totally enclosed.
3. Enclosure Materials: Cast iron .
4. Motor Bearings: Rated for 200,000 hours with external lubrication connections.

5. Efficiency: Premium efficient.
6. Service Factor: 1.15.
7. Speed Control: Variable Frequency Drive

C. Mounting: Fan wheel, motor, and drives shall be mounted to fan casing with elastomeric isolators.

2.6 COOLING COILS

A. Capacity Ratings: Comply with ASHRAE 33 and ARI 410 and coil bearing the ARI label.

B. Coil Casing Material: Galvanized steel.

C. Tube Material: Copper.

D. Tube Header Material: Copper.

E. Fin Material: Aluminum.

F. Fin and Tube Joints: Mechanical bond.

G. Leak Test: Coils shall be leak tested with air underwater.

H. Refrigerant Coil Capacity Reduction: Circuit coils for face control.

I. Refrigerant Coil Suction and Distributor Header Materials: Seamless copper tube with brazed joints.

J. Coating: Phenolic epoxy corrosion-protection coating after assembly.

2.7 REFRIGERATION SYSTEM

A. Comply with requirements in ASHRAE 15, "Safety Standard for Refrigeration Systems."

B. Refrigerant Charge: Factory charged with refrigerant and filled with oil.

C. Compressors: Variable capacity Scroll compressors with integral vibration isolators, internal overcurrent and overtemperature protection, internal pressure relief, and crankcase heater.

D. Refrigerant: R-410A.

1. Classified as Safety Group A1 according to ASHRAE 34.
2. Provide unit with operating charge of refrigerant.

E. Refrigeration System Specialties:

1. Expansion valve with replaceable thermostatic element.
2. Refrigerant dryer.
3. High-pressure switch.
4. Low-pressure switch.
5. Thermostat for coil freeze-up protection during low ambient temperature operation or loss of air.
6. Brass service valves installed in discharge and liquid lines.

F. Refrigerant condenser coils:

1. Capacity Ratings: Complying with ASHRAE 33 and ARI 410 and coil bearing the ARI label.
2. Tube Material: Copper.
3. Fin Material: Aluminum.

4. Fin and Tube Joint: Mechanical bond.
5. Leak Test: Coils shall be leak tested with air underwater.
6. Coating: Phenolic epoxy corrosion-protection coating after assembly.

G. Condenser Fan Assembly:

1. Fans: Direct-drive propeller type with statically and dynamically balanced fan blades.
2. Fan Motors:

   a. Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
   b. Motor Enclosure: Totally enclosed non-ventilating (TENV) or totally enclosed air over (TEAO) enclosure.
   c. Enclosure Materials: Cast iron .
   d. Motor Bearings: Permanently lubricated bearings.
   e. Built-in overcurrent and thermal-overload protection.
   f. Efficiency: Premium efficient.
   g. Service Factor: 1.15.
   h. Speed control: Variable frequency drive.

3. Fan Safety Guards: Steel with corrosion-resistant coating.

H. Safety Controls:

1. Compressor motor and condenser coil fan motor low ambient lockout.
2. Overcurrent protection for compressor motor.

2.8 INDIRECT-FIRED GAS FURNACE HEATING

A. Furnace Assembly:

1. Factory assembled, piped, and wired.
2. Comply with requirements in NFPA 54, "National Fuel Gas Code," and ANSI Z21.47, "Gas-Fired Central Furnaces."
3. AGA Approval: Designed and certified by and bearing label of AGA.

B. Burners:

1. Heat-Exchanger Material: Aluminum with a minimum thermal efficiency of 80 percent.
2. Fuel: Natural gas.
3. Ignition: Electronically controlled electric spark with flame sensor.

C. Heat-Exchanger Drain Pan Material: Stainless steel.

D. Venting: Power vent with integral, motorized centrifugal fan interlocked with gas valve.

E. Safety Controls:

1. Gas Control Valve: Multi-Staging.
2. Gas Train: Single-body, regulated, redundant, 24-V ac gas valve assembly containing pilot solenoid valve, pilot filter, pressure regulator, pilot shutoff, and manual shutoff.

2.9 OUTDOOR-AIR INTAKE HOOD

A. Type: Manufacturer's standard hood or louver.

B. Materials: Match cabinet.

C. Bird Screen: Comply with requirements in ASHRAE 62.1.

D. Configuration: Designed to inhibit wind-driven rain and snow from entering unit.

2.10 FILTERS

A. Pre Filters: 2-inch- thick, fiberglass, pleated, throw away with ASHRAE 30% efficiency.

B. Extended-Surface, Disposable Panel Filters:

1. Comply with NFPA 90A.
2. Factory-fabricated, dry, extended-surface type.
3. Thickness: 4 inches.
4. Minimum Arrestance: 85, according to ASHRAE 52.1.
5. Minimum Merv: 13, according to ASHRAE 52.2.
6. Media: Fibrous material formed into deep-V-shaped pleats with antimicrobial agent
7. and held by self-supporting wire grid.

C. Mounting Frames:

1. Panel filters arranged for flat or angular orientation, with access doors on both sides of unit. Filters shall be removable from one side or from access plenum.
2. Extended surface filters arranged for flat orientation, removable from access plenum.
3. Galvanized or stainless steel with gaskets and fasteners, suitable for bolting together into built-up filter banks with space for prefilter.

2.11 ENERGY RECOVERY WHEEL

A. Frame: Rigid metal frame containing wheel drive motor, drive belt, wheel seals and bearings.

B. Energy wheel: Total energy heat wheel constructed of light weight polymer with permanent bonded desiccant coating.

C. Motor Bearings: Ball bearings with external lubrication connections.

2.12 ELECTRICAL POWER CONNECTIONS

A. General Electrical Power Connection Requirements: Factory-installed and -wired switches, motor controllers, transformers, and other necessary electrical devices shall provide a single-point field power connection to unit.

B. Enclosure: NEMA 250, mounted in unit with hinged access door in unit cabinet having a lock and key or padlock and key,

C. Wiring: Numbered and color-coded to match wiring diagram.

D. Wiring Location: Install factory wiring outside an enclosure in a raceway.

E. Power Interface: Field power interface shall be to NEMA KS 1, heavy-duty, nonfused disconnect switch.

F. Factory Wiring: Branch power circuit to each motor and to controls with one of the following disconnecting means:

1. NEMA KS 1, heavy-duty, fusible switch with rejection-type fuse clips rated for fuses. Select and size fuses to provide Type 2 protection according to IEC 60947-4-1.
2. NEMA KS 1, heavy-duty, nonfusible switch.
3. UL 489, motor-circuit protector (circuit breaker) with field-adjustable, short-circuit trip coordinated with motor locked-rotor amperes.

G. Factory-Mounted, Overcurrent-Protection Service: For each motor.

H. Transformer: Factory mounted with primary and secondary fuses and sized with enough capacity to operate electrical load plus spare capacity.

I. Controls: Factory wire unit-mounted controls where indicated.

J. Lights: Factory wire unit-mounted lights.

K. Receptacle: Factory wire unit-mounted, ground fault interrupt (GFI) duplex receptacle.

L. Control Relays: Auxiliary and adjustable time-delay relays.

2.13 CONTROLS

A. Control equipment are specified in Section 230923 "Direct Digital Control (DDC) System for HVAC" and sequence of operation are shown on drawings.

B. Control Wiring: Factory wire connection for controls' power supply.

C. Control Devices: Sensors, transmitters, relays, switches, detectors, operators, actuators, and valves shall be manufacturer's standard items to accomplish indicated control functions.

D. Control Dampers:

1. Damper Location: Factory installed inside unit for ease of blade axle and bushing service. Arrange dampers located in a mixing box to achieve convergent airflow to minimize stratification.
2. Damper Leakage: Comply with requirements in AMCA 500-D. Leakage shall not exceed 6.5 cfm per sq. ft. at a static-pressure differential of 4.0 inches water column when a torque of 5 inch pounds per sq. ft is applied to the damper jackshaft.
3. Damper Rating: Rated for close-off pressure equal to the fan shutoff pressure.
4. Damper Label: Bear the AMCA seal for both air leakage and performance.
5. Blade Configuration: Unless otherwise indicated, use parallel blade configuration for two-position control and equipment isolation service and use modulating control when mixing two airstreams. For other applications, use an opposed-blade configuration.
6. Damper Frame Material: Extruded aluminum.
7. Blade Type: Single-thickness metal reinforced with multiple V-grooves.
8. Blade Material: Extruded aluminum.

9. Maximum Blade Width: 6 inches.
10. Maximum Blade Length: 48 inches.
11. Blade Seals: Replaceable, continuous perimeter vinyl seals and jambs with stainless-steel compression-type seals.
12. Bearings: Thrust bearings for vertical blade axles.
13. Airflow Measurement:

    a. Monitoring System: Complete and functioning system of airflow monitoring as an integral part of the damper assembly where indicated.
    b. Remote Monitoring Signal: 0-10 volt or 4-20 mA scaled signal.
    c. Accuracy of flow measurement: Within 5 percent of the actual flow rate between the range of the scheduled minimum and maximum airflow. For units with a large range between minimum and maximum airflow, configure the damper sections and flow measurement assembly as necessary to comply with accuracy.
    d. Straightening Device: Integral to the flow measurement assembly if required to achieve the specified accuracy as installed.
    e. flow measuring device: Suitable for operation in untreated and unfiltered outdoor air. If necessary, include temperature and altitude compensation and correction to maintain the accuracy.

E. Damper Operators:

1. Factory-installed electric operator for each damper assembly with one operator for each damper assembly mounted to the damper frame.
2. Operator capable of shutoff against fan pressure and able to operate the damper with sufficient reserve power to achieve smooth modulating action and proper speed of response at the velocity and pressure conditions to which the damper is subjected.
3. Maximum Operating Time: Open or close damper 90 degrees in 60 seconds.
4. Adjustable Stops: For both maximum and minimum positions.
5. Position Indicator and Graduated Scale: Factory installed on each actuator with words "OPEN" and "CLOSED," or similar identification, at travel limits.
6. Spring-return operator to fail-safe; either closed or open as required by application.
7. Operator Type: Direct coupled, designed for minimum 60,000 full-stroke cycles at rated torque.
8. Position feedback Signal: For remote monitoring of damper position.
9. Coupling: V-bolt and V-shaped, toothed cradle.
10. Circuitry: Electronic overload or digital rotation-sensing circuitry.

F. Refrigeration System Controls:

1. Unit-mounted enthalpy controller shall lock out refrigerant system when outdoor-air enthalpy is less than 28 Btu/lb of dry air or outdoor-air temperature is less than 55 deg F .
2. Outdoor-air sensor de-energizes dehumidifier operation when outdoor-air temperature is less than 55 deg F.
3. Relative-humidity sensor energizes dehumidifier operation when relative humidity is more than 50 percent.

G. Furnace Controls:
1. Staged Burner Control: Four steps of control.
2. Electronic Burner Control: 20 to 100 percent modulation of the firing rate; 10 to 100 percent with dual-furnace units.

H. Damper Controls: Space pressure sensor modulates outdoor- and return-air dampers to maintain a positive pressure in space at a minimum of 0.05 inch wg with respect to outdoor reference.

I. Integral Smoke Alarm: Smoke detector installed in supply and return air.

J. DDC Temperature Control: Standalone control module for link between unit controls and DDC temperature-control system. Control module shall be compatible with control system specified in Section 230923 "Direct Digital Control (DDC) System for HVAC." Links shall include the following:

1. Start/stop interface relay, and relay to notify DDC temperature-control system alarm condition.
2. Hardware interface or additional sensors for the following:

a. Room temperature.
b. Discharge-air temperature.
c. Refrigeration system operating.
d. Furnace operating.
e. Constant and variable motor loads.
f. Variable-frequency-controller operation.
g. Cooling load.
h. Economizer cycles.
i. Air-distribution static pressure and ventilation-air volumes.

K. Interface with DDC System for HVAC: Factory-installed hardware and software to enable the DDC system for HVAC to monitor, control, and display unit status and alarms.

1. Hardwired Points: As indicated on drawings.

2. ASHRAE 135 (BACnet or other Industry-accepted, open-protocol communication interface with the DDC system for HVAC shall enable the DDC system for HVAC operator to remotely control and monitor the unit from an operator workstation. Control features and monitoring points displayed locally at unit control panel shall be available through the DDC system for HVAC.

2.14 ACCESSORIES

A. Service Lights and Switch: Factory installed in fan and coil sections with weatherproof cover. Factory wire lights to a single-point field connection.

B. Duplex Receptacle: Factory mounted in unit supply-fan section and refrigeration section, with 20 amp 120 V GFI duplex receptacle and weatherproof cover.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for piping, ducts, and electrical systems to verify actual locations of connections before equipment installation.

C. Examine roof curbs and equipment supports for suitable conditions where units will be installed.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with manufacturer's rigging and installation instructions for unloading units and moving to final locations.

B. Curb Support: Install roof curb on roof structure according to "The NRCA Roofing Manual."

1. Install and secure units on curbs and coordinate roof penetrations and flashing with roof construction.
2. Coordinate size, installation, and structural capacity of roof curbs, equipment supports, and roof penetrations. These items are specified in Section 077200 "Roof Accessories."
3. Coordinate size, location, and installation of unit manufacturer's roof curbs and equipment supports with roof Installer.

C. Restrained Curb Support: Install restrained vibration isolation roof-curb rails on roof structure according to "The NRCA Roofing Manual."

D. Install 3000-psi, compressive-strength (28-day) concrete base inside roof curb, 4 inches thick. Concrete and reinforcement are specified with concrete.

E. Comply with requirements for gas-fired furnace installation in NFPA 54, "National Fuel Gas Code."

F. Install separate devices furnished by manufacturer and not factory installed.

G. Install new filters at completion of equipment installation and before testing, adjusting, and balancing.

H. Install drain pipes from unit drain pans to sanitary drain.

1. Drain Piping: Drawn-temper copper water tubing complying with ASTM B 88, Type L, with soldered joints.

2. Pipe Size: Same size as condensate drain pan connection.

3.3 CONNECTIONS

A. Where installing piping adjacent to units, allow space for service and maintenance.

B. Gas Piping Connections:

1. Comply with requirements in Section 231123 "Facility Natural-Gas Piping."
2. Connect gas piping to furnace, full size of gas train inlet, and connect with union, pressure regulator, and shutoff valve with sufficient clearance for burner removal and service.

3. Install AGA-approved flexible connectors.

C. Duct Connections:

1. Comply with requirements in Section 233113 "Metal Ducts."
2. Drawings indicate the general arrangement of ducts.
3. Connect ducts to units with flexible duct connectors. Comply with requirements for flexible duct connectors in Section 233300 "Air Duct Accessories."

D. Electrical Connections: Comply with requirements for power wiring, switches, and motor controls in electrical Sections.

1. Install electrical devices furnished by unit manufacturer but not factory mounted.

3.4 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. Inspect units for visible damage to furnace combustion chamber.
3. Perform the following operations for both minimum and maximum firing and adjust burner for peak efficiency:

    a. Measure gas pressure at manifold.
    b. Measure combustion-air temperature at inlet to combustion chamber.
    c. Measure flue-gas temperature at furnace discharge.
    d. Perform flue-gas analysis. Measure and record flue-gas carbon dioxide and oxygen concentration.
    e. Measure supply-air temperature and volume when burner is at maximum firing rate and when burner is off. Calculate useful heat to supply air.

4. Verify operation of remote panel including pilot-light operation and failure modes. Inspect the following:

    a. High-limit heat exchanger.
    b. Alarms.

5. Inspect units for visible damage to refrigerant compressor, condenser and evaporator coils, and fans.
6. Start refrigeration system when outdoor-air temperature is within normal operating limits and measure and record the following:

    a. Cooling coil leaving-air, dry- and wet-bulb temperatures.
    b. Cooling coil entering-air, dry- and wet-bulb temperatures.
    c. Condenser coil entering-air dry-bulb temperature.
    d. Condenser coil leaving-air dry-bulb temperature.

7. Simulate maximum cooling demand and inspect the following:

    a. Compressor refrigerant suction and hot-gas pressures.
    b. Short-circuiting of air through outside coil or from outside coil to outdoor-air intake.

8. Inspect casing insulation for integrity, moisture content, and adhesion.

9. Verify that clearances have been provided for servicing.
10. Verify that controls are connected and operable.
11. Verify that filters are installed.
12. Clean coils and inspect for construction debris.
13. Clean furnace flue and inspect for construction debris.
14. Inspect operation of power vents.
15. Purge gas line.
16. Inspect and adjust vibration isolators and seismic restraints.
17. Verify bearing lubrication.
18. Clean fans and inspect fan-wheel rotation for movement in correct direction without vibration and binding.
19. Adjust fan belts to proper alignment and tension.
20. Start unit.
21. Inspect and record performance of interlocks and protective devices including response to smoke detectors by fan controls and fire alarm.
22. Operate unit for run-in period.
23. Calibrate controls.
24. Adjust and inspect high-temperature limits.
25. Inspect outdoor-air dampers for proper stroke and interlock with return-air dampers.
26. Verify operational sequence of controls.
27. Measure and record the following airflows. Plot fan volumes on fan curve.

    a. Supply-air volume.
    b. Return-air flow.
    c. Outdoor-air flow.

B. After startup, change filters, verify bearing lubrication, and adjust belt tension.

C. Remove and replace components that do not properly operate and repeat startup procedures as specified above.

D. Prepare written report of the results of startup services.

3.5 ADJUSTING

A. Adjust initial temperature and humidity set points.

B. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

C. Occupancy Adjustments: When requested within12 months from date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

3.6 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain units.

B. Refer Division 01 for administrative and procedural requirements for demonstration and training

END OF SECTION 23 74 33

SECTION 23 81 26 - SPLIT-SYSTEM AIR-CONDITIONERS

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes

1. Split-system air-conditioning units consisting of separate evaporator-fan and compressor-condenser components. Units are designed for exposed mounting.

2. Split-system air-conditioning units consisting of inbuilt evaporator-fan, compressor, separate condenser components. Indoor units are vertical discharge designed for floor mounting and remote condensers for high sensible loads.

B. Related Requirements:
1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 SUBMITTALS

A. Product Data: Include rated capacities, furnished specialties, and accessories for each type of product indicated. Include performance data in terms of capacities, outlet velocities, static pressures, sound power characteristics, motor requirements, and electrical characteristics.

B. Shop Drawings: Diagram power, signal, and control wiring.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For split-system air-conditioning units to include in emergency, operation, and maintenance manuals.

E. Warranty: Special warranty specified in this Section.

1.4 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of split-system units and are based on the specific system indicated. Refer to Part 2 – Products.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1-2004, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."

D. ASHRAE/IESNA 90.1-2004 Compliance: Applicable requirements in ASHRAE/IESNA 90.1-2004, Section 6 - "Heating, Ventilating, and Air-Conditioning."

1.5 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of split-system air-conditioning units that fail in materials or workmanship within specified warranty period.

1. Warranty Period: Three years from date of Substantial Completion.

1.6 MAINTENANCE SPARE PARTS

A. Filters: Two sets for each unit.

B. Other spare parts: Manufacturer’s recommended quantity, but not less than 10% of all replacement parts, with a minimum quantity of one each.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Carrier Air Conditioning; Div. of Carrier Corporation.
2. Lennox Industries Inc.
3. Mitsubishi Electric Sales Canada, Inc.
4. Mitsubishi Electronics America, Inc.; HVAC Division.
5. Data Aire Inc.
6. Sanyo Fisher (U.S.A.) Corp..
7. Trane Company (The); Unitary Products Group.
8. York International Corp.
9. Dectron Inc.

2.2 WALL/CEILING-MOUNT UNITS

A. Evaporator Cabinet: Enameled steel with removable panels on front and ends in color selected by City/ Engineer, and discharge drain pans with drain connection.

1. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1-2004.

2. Drain Pan and Drain Connection: Comply with ASHRAE 62.1-2004.

B. Refrigerant Coil: Copper tube, with mechanically bonded aluminum fins, complying with ARI 210/240, and with thermal-expansion valve.

C. Fan: Direct drive, centrifugal fan.

D. Fan Motors: Comply with requirements in Section 23 05 13 – Common Motor Requirements for HVAC Equipment.

1. Special Motor Features: Multitapped, multispeed with internal thermal protection and permanent lubrication.

E. Filters: Permanent, cleanable.

F. Electrical: Single point electrical connection with controls and disconnect.

G. Refrigerant charge: R-410A

H. Remote Air Cooled Condensing unit components

1. Compressor Casing: Steel, finished with baked enamel in color selected by City/ Engineer, with removable panels for access to controls, weep holes for water drainage, and mounting holes in base. Provide brass service valves, fittings, and gage ports on exterior of casing.

2. Compressor: Scroll, Hermetically sealed with crankcase heater and mounted on vibration isolation. Compressor motor shall have thermal- and current-sensitive overload devices, start capacitor, relay, and contactor.

3. Two-speed compressor motor with manual-reset high-pressure switch and automatic-reset low-pressure switch.

4. Refrigerant Coil: Copper tube, with mechanically bonded aluminum fins, complying with ARI 210/240, and with liquid subcooler.

5. Fan: Aluminum-propeller type, directly connected to motor.

6. Motor: Permanently lubricated, with integral thermal-overload protection.

7. Low Ambient Kit: Permits operation down to 45 deg F (7 deg C).

8. Mounting Base: Polyethylene.

I. Minimum Energy Efficiency: Comply with ASHRAE/IESNA 90.1-2004, "Energy Standard for Buildings except Low-Rise Residential Buildings."

J. Accessories

1. Control equipment and sequence of operation are specified in Section 23 09 00 – HVAC Instrumentation and Control and sequence of operations for HVAC Controls.

2. Thermostat: Wireless infrared functioning to remotely control compressor and evaporator fan, with the following features:

3. Compressor time delay.

4. 24-hour time control of system stop and start.

5. Liquid-crystal display indicating temperature, set-point temperature, time setting, operating mode, and fan speed.

6. Fan-speed selection, including auto setting.

7. Automatic-reset timer to prevent rapid cycling of compressor.

K. Refrigerant Line Kits: Soft-annealed copper suction and liquid lines factory cleaned, dried, pressurized, and sealed; factory-insulated suction line with flared fittings at both ends.

1. Minimum Insulation Thickness: 1 inch.

2.3 FLOOR MOUNT SPLIT SYSTEM UNITS

A. Casing: 14 gauge welded tubular steel frame coated with corrosion inhibiting. Internal steel fans coated for protection against corrosion. Front and side insulated access steel doors with one inch (1"), 1-1/2 pound density fiberglass insulation coated with neoprene. Each door shall be provided with heavy duty hinges and sure close latches. The doors shall be painted to match or contrast with other equipment in the space. Bypass air shall be provided around the cooling and, stainless steel drain pan and drain connection to comply with ASHRAE 62.1-2004.

B. Supply Fan section: The fan section shall be belt driven, centrifugal type, double width, double inlet and shall be statically and dynamically balanced at the factory as a complete assembly. The fan wheel shall be supported on a heavy steel shaft having self-aligning ball bearings with a minimum life span of 100,000 hours driven by a motor mounted on an adjustable slide base. The drive package shall be belt driven with variable pitch sheave sized for 200% of the fan motor horsepower. The fan shall be located to draw air over the coil for maximum coil performance.

C. Air Filters: The filter chamber shall be an integral part of the system, designed within the frame and cabinet. The filter shall be two-inch (2") deep pleated design, rated not less than 30 percent efficient (based on ASHRAE Std. 52.1-1992).

D. Refrigeration system: The refrigeration system shall be split type with an indoor evaporator section and remote outdoor condenser. The indoor evaporator section shall include the cooling coil, compressor, humidifier, reheat, filter and controls. The cooling coil shall constructed with 1/2" O.D. copper tube with 12 fins per inch of corrugated aluminum with a maximum face velocity of 500 feet per minute. The expansion valve shall be of the adjustable thermostatic type with external equalization. The compressor shall be hermetic scroll type, with complete overload protection on all three power lines, internal thermostat for winding protection, anti-slug device, crankcase heater, sight-glass, and low pressure override timer for positive starting at low temperatures. The filter drier shall be of the flare fitting type for non-torch servicing. The circuit shall contain high and low pressure switches safety switches.

E. Control Panel: Microprocessor based panel including unit switching functions and 2 row, 80 character LCD display of normal functions, malfunctions, and service diagnostics. The panel shall allow recall and display of the high and low temperature for the last 24 hours, high and low humidity for the last 24 hours, current percent of capacity and average percent of capacity for the last hour of operation for cool 1, reheat, humidification, and dehumidification, component runtimes for fan motor, reheat, humidification, and dehumidification. Multilevel

password access programming accomplished entirely from the front of the unit. Battery back up to maintain historical data base. Automatic display of multiple messages. The control shall include temperature anticipation, moisture level humidity control and automatic coil flush cycles. Display, and annunciation of an audible alarm. Summary of remote alarms. Continuous display of alarm condition until the malfunction is corrected. Sequential display of multiple alarms in order of occurrence, with unacknowledged audible alarms continuing to sound. Automatic system start up self-test. User accessible diagnostic trouble shooting program displaying name of controlled item, output relay number, terminal plug and pin number for each controlled item on LCD screen.

F. Electric Reheat: The reheat shall be of the finned enclosed, sheath type, fabricated of stainless steel core sheath with plated fins to withstand moist conditions. The reheat shall be installed on the air discharge side of the cooling coil and shall have 3 stages.

G. Remote Air Cooled Condenser: As per Section 23 63 13 – Air Cooled Refrigerant Condensers. Air cooled condenser shall match indoor unit performance, and supplied by same manufacturer as the indoor unit and operating as one system complying with the sequence of operation.

H. Power Connection: Single point connection with non automatic disconnect switch.

2.4 MOTORS

A. Comply with requirements in Section 23 05 13 – Common Motor Requirements for HVAC.

2.5 SOURCE QUALITY CONTROL

A. Verification of Performance: According to ETL or CSA Certified.

PART 3- EXECUTION

3.1 INSTALLATION

A. Install units level and plumb.

B. Install floor mounted unit level and plumb on spring isolators on 4” concrete pad.

C. Install evaporator-fan components using manufacturer's standard mounting devices securely fastened to building structure.

D. Install floor-mounting, remote condensing unit/ condenser on 4-inch- thick, reinforced concrete base; 4 inches larger on each side than unit. Concrete, reinforcement, and formwork are specified in Division 03 Section "Cast-in-Place Concrete." Coordinate anchor installation with concrete base.

E. Install floor-mounting, compressor-condenser components on polyethylene mounting base.

F. Install compressor-condenser components on restrained, spring isolators.

G. Install and connect pre-charged refrigerant tubing to component's quick-connect fittings. Install tubing to allow access to unit.

3.2 CONNECTIONS

A. Install piping adjacent to unit to allow service and maintenance.

B. Ground equipment according to Division 26 Section “Grounding and Bonding for Electrical Systems.”

C. Electrical Connections: Comply with requirements in Division 26 Sections for power wiring, switches, and motor controls.

3.3 FIELD QUALITY CONTROL

A. Manufacturer’s Field Service: Engage a factory-authorized service representative to inspect field-assembled components and equipment installation, including connections. Report results in writing.

B. Perform the following field tests and inspections and prepare test reports:

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.

2. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.

3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

C. Remove and replace malfunctioning units and retest as specified above.

3.4 CONNECTIONS

A. Install condensate drain, minimum connection size, with trap and indirect connection to nearest roof drain or area drain.

B. Duct installation requirements are specified in other Division 23 Sections. Drawings indicate the general arrangement of ducts. The following are specific connection requirements:

1. Connect supply and return ducts with flexible duct connectors specified in Section 23 33 00 – Air Duct Accessories.

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections. Report results in writing.

B. Perform tests and inspections and prepare test reports.

C. Tests and Inspections:

1. After installing unit and after electrical circuitry has been energized, test units for compliance with requirements.

2. Inspect for and remove shipping bolts, blocks, and tie-down straps.

3. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.

4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

D. Remove and replace malfunctioning units and retest as specified above.

3.6 START-UP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

B. Complete installation and startup checks according to manufacturer's written instructions and do the following:

1. Inspect for visible damage to unit casing.
2. Inspect for visible damage to compressor, coils, and fans.
3. Inspect internal insulation.
4. Verify that labels are clearly visible.
5. Verify that clearances have been provided for servicing.
6. Verify that controls are connected and operable.
7. Verify that filters are installed.
8. Clean condenser coil and inspect for construction debris.
9. Remove packing from vibration isolators.
10. Verify lubrication on fan and motor bearings.
11. Inspect fan-wheel rotation for movement in correct direction without vibration and binding.
12. Adjust fan belts to proper alignment and tension.
13. Inspect controls for correct sequencing of heating, refrigeration, and normal and emergency shutdown.
14. After startup and performance testing and prior to Substantial Completion, replace existing filters with new filters.

3.7 CLEANING AND ADJUSTING

A. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to site during other-than-normal occupancy hours for this purpose.

B. After completing system installation and testing, adjusting, and balancing the unit and air-distribution systems, clean filter housings and install new filters.

3.8 DEMONSTRATION

A. Engage a factory-authorized service representative to train Baltimore City maintenance personnel to adjust, operate, and maintain unit.

B. Refer Division 01 for administrative and procedural requirements for demonstration and training.

END OF SECTION 23 81 26

SECTION 23 81 30 – VARIABLE REFRIGERANT FLOW SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes Air Cooled Multi Zone, Variable Refrigerant Flow system consisting of inverter 3 pipe simultaneous heating and cooling. Each system/zone is based on one air cooled outdoor unit connected by a single refrigerant circuit consisting of suction, hot gas and liquid pipework. Both hot gas and liquid for cooling are apportioned through a series of refrigerant distribution controllers to multiple indoor units.

B. Related Requirements:
   1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
   2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, and furnished specialties and accessories. Include performance data in terms of capacities, outlet velocities, static pressures, sound power characteristics, motor requirements, and electrical characteristics.

B. LEED Submittals:

   1. Product Data for Credit EA 4: Documentation indicating that equipment and refrigerants comply.

C. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.

   1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   2. Wiring Diagrams: For power, signal, and control wiring.
   3. Refrigerant piping indicating sizes, routing and connections to indoor units, and distribution controllers, in coordination with other building structure and services.

D. Samples for Initial Selection: For units with factory-applied color finishes.

1.4 INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

B. Warranty: Sample of special warranty.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For Multi Zone, Variable Refrigerant Flow systems to include in emergency, operation, and maintenance manuals.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Filters: Two sets for each indoor unit.

B. Other spare parts: Manufacturer’s recommended quantity, but not less than 10% of all replacement parts, with a minimum quantity of one each.

1.7 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. ASHRAE Compliance:

1. Fabricate and label refrigeration system to comply with ASHRAE 15, "Safety Standard for Refrigeration Systems."
2. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 4 - "Outdoor Air Quality," Section 5 - "Systems and Equipment," Section 6 - " Procedures," and Section 7 - "Construction and System Start-up."

C. ASHRAE/IESNA Compliance: Applicable requirements in ASHRAE/IESNA 90.1, and including Certification in the current AHRI Directory per AHRI Standard 1230..

1.8 COORDINATION

A. Coordinate sizes and locations of roof curbs, equipment supports, and roof penetrations with actual equipment provided.

1.9 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of Multi Zone, Variable Refrigerant Flow systems that fail in materials or workmanship within specified warranty period.

1. Warranty Period:

a. For Compressor: Manufacturer’s Ten years from date of Substantial Completion.
b. For Parts: Manufacturer’s Ten year from date of Substantial Completion.
c. For Labor: Two years from date of Substantial Completion.
d. Air Handlers: Manufacturer’s 10 years from date of substantial completion

e. Branch Selector Boxes: Manufacturer's 10 years from date of substantial completions
f. Zone Controllers: Manufacturer's 10 years from date of substantial completion
g. Centralized Controller: 1 Year from date of substantial completion

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Multi Zone, Variable Refrigerant Flow systems:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturer specified.
2.
a. Daikin.
b. Mitsubishi Electric Cooling and Heating.
c. Trane
d. Or approved equal.

2.2 INDOOR UNITS

A. Concealed Evaporator-Fan Components:

1. Chassis: Galvanized steel with flanged edges, removable panels for servicing, and insulation on back of panel.
2. Insulation: Faced, glass-fiber duct liner.
3. Refrigerant Coil: Copper tube, with mechanically bonded aluminum fins and thermal-expansion valve. Comply with ARI 206/110.
4. Fan: Forward-curved, double-width wheel of galvanized steel; directly connected to motor.
5. Fan Motors:

a. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
b. DC ECM Motors, multitapped, multispeed with internal thermal protection and permanent lubrication.
c. Wiring Terminations: Connect motor to chassis wiring with plug connection.

6. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.
7. Filters: Permanent, cleanable.
8. Condensate Drain Pans:

a. Fabricated with one percent slope in at least two planes to collect condensate from cooling coils (including coil piping connections, coil headers, and return bends) and humidifiers, and to direct water toward drain connection.

1) Length: Extend drain pan downstream from leaving face to comply with ASHRAE 62.1.
2) Depth: A minimum of 2 inches deep.
b. Double-wall, galvanized-steel sheet with space between walls filled with foam insulation and moisture-tight seal.

c. Drain Connection: Located at lowest point of pan and sized to prevent overflow. Terminate with threaded nipple on one end of pan.

1) Minimum Connection Size: NPS 1.

d. Pan-Top Surface Coating: Asphaltic waterproofing compound.
e. Units with stacked coils shall have an intermediate drain pan to collect condensate from top coil.

9. Controls:

a. Provide air and refrigerant temperature sensors, expansion valves, controlled by microprocessor control system, and integral return air temperature sensor.

B. Wall-Mounted, Evaporator-Fan Components:

1. Cabinet: Enameled steel with removable panels on front and ends in color selected by Architect, and discharge drain pans with drain connection.
2. Refrigerant Coil: Copper tube, with mechanically bonded aluminum fins and thermal-expansion valve. Comply with ARI 206/110.
3. Fan: Direct drive, centrifugal.
4. Fan Motors:

a. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
b. Multitapped, multispeed with internal thermal protection and permanent lubrication.
c. Enclosure Type: Totally enclosed, fan cooled.
d. NEMA Premium (TM) efficient motors as defined in NEMA MG 1.
e. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in electrical Sections.
f. Mount unit-mounted disconnect switches on interior of unit.

5. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.
6. Condensate Drain Pans:

a. Fabricated with one percent slope in at least two planes to collect condensate from cooling coils (including coil piping connections, coil headers, and return bends) and humidifiers, and to direct water toward drain connection.

1) Length: Extend drain pan downstream from leaving face to comply with ASHRAE 62.1.
2) Depth: A minimum of 1 inch deep.

b. Double-wall, galvanized-steel sheet with space between walls filled with foam insulation and moisture-tight seal.
c. Drain Connection: Located at lowest point of pan and sized to prevent overflow. Terminate with threaded nipple on one end of pan.

1) Minimum Connection Size: NPS 1.

d. Pan-Top Surface Coating: Asphaltic waterproofing compound.

7. Air Filtration Section:

a. General Requirements for Air Filtration Section:

1) Comply with NFPA 90A.
2) Minimum Arrestance: According to ASHRAE 52.1 and MERV according to ASHRAE 52.2.
3) Filter-Holding Frames: Arranged for flat or angular orientation, with access doors on both sides of unit. Filters shall be removable from one side or lifted out from access plenum.

b. Disposable Panel Filters:

1) Factory-fabricated, viscous-coated, flat-panel type.
2) Thickness: 1 inch.
3) Arrestance according to ASHRAE 52.1: 80.
4) MERV according to ASHRAE 52.2: 5.
5) Media: Interlaced glass fibers sprayed with nonflammable adhesive and antimicrobial agent.
6) Frame: Galvanized steel, with metal grid on outlet side, steel rod grid on inlet side, and hinged; with pull and retaining handles.

2.3 OUTDOOR UNITS

A. Air-Cooled, Outdoor unit Components:

1. Casing: Steel, finished with baked enamel in standard manufacturer's color with removable panels for access to controls, weep holes for water drainage, and mounting holes in base. Provide brass service valves, fittings, and gage ports on exterior of casing.
2. Compressor: Hermetically sealed with crankcase heater and mounted on vibration isolation device. Compressor motor shall have thermal- and current-sensitive overload devices, start capacitor, relay, and contactor.

a. Compressor Type: Inverter Scroll.
b. Variable speed compressor motor controlled by frequency inverter, high-pressure switch, and automatic-reset low-pressure switch.
c. Refrigerant Charge: R-410A.
d. Refrigerant Coil: Copper tube, with mechanically bonded aluminum fins and liquid subcooler. Comply with ARI 206/110.

3. Fan: Propeller type, directly connected to motor.
4. Motor: Totally enclosed, multispeed, with integral thermal-overload protection.
5. Low Ambient Kit: Permits operation down to 45 deg F.
6. Mounting Base: Polyethylene.
7. Accessories: Expansion valves, oil separators, suction and liquid shutoff valves, strainers, liquid receivers and accumulators.

2.4 REFRIGERANT DISTRIBUTION CONTROLLERS

A. Distribution Controllers:

1. The controller casing shall be constructed of galvanized steel metal panels with insulated valve cavity. The controller shall divert either hot gas or liquid refrigerant to the connected indoor unit(s) depending on the cooling or heating requirements. The controller shall have single or multiple refrigerant outlets, each outlet having simultaneous independent selection of either heating or cooling.

2.5 ACCESSORIES

A. Sequence of operation are specified on drawings.

B. Individual temperature controller: Wireless infrared to remotely control individual indoor unit or a group of units with the following features:
1. 24-hour time control of system stop and start.
2. Liquid-crystal display indicating temperature, set-point temperature, time setting, operating mode, and fan speed.
3. Fan-speed selection including auto setting.
4. Temperature selection and adjustment.
5. Operation mode selection.
6. Filter cleaning identification.
7. Full fault diagnostics display.
8. Built-in temperature sensor.

C. Central controller: Capable of controlling network of indoor units, individually, in groups and unanimously with the following features for each series of indoor unit arrangements:
1. 24-hour time control of system stop and start.
2. Liquid-crystal display indicating temperature, set-point temperature, time setting, operating mode, and fan speed.
3. Fan-speed selection including auto setting.
4. Temperature selection and adjustment.
5. Operation mode selection.
6. Filter cleaning identification.
7. Full fault diagnostics display, identifying either an individual indoor unit or a series of indoor units.

D. Central controller shall have the capability to override the individual remote controller of any unit on the same network.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Installing contractor shall have completed all Manufacturer’s Installation and Commissioning classes (16 hours), Service & Troubleshooting Classes (16 hours) and Controls Application and Commissioning Classes (16 hours).

B. Installing contractor shall have successfully installed a minimum of (5) five VRF projects in excess of 50 TR each and provide testimonials for submittal.

C. Install units level and plumb.

D. Install indoor units using manufacturer's standard mounting devices securely fastened to building structure.

E. Install roof-mounted, outdoor units on equipment supports specified in Section 077200 "Roof Accessories." Anchor units to supports with removable, cadmium-plated fasteners.

F. Equipment Mounting:
1. Comply with requirements for vibration isolation devices specified in Section 230548.13 "Vibration Controls for HVAC."

G. Pipework: Refer to Section 23 23 00 “Refrigerant Piping” for additional requirements.

1. Size refrigerant pipework in accordance with manufacturer’s written instructions. Design pipework routes to maintain shortest possible distance, in coordination with building structure and other services, and complying with the maximum allowable distance limitations. Install pipework with minimum joints and insulate with close cell elastomeric insulation. Utilize only branch pipes and branch pipe kits supplied or recommended by the manufacturer. Reducing tees are not permitted. Make all brazed joints with dry nitrogen purge to ensure the prevention of oxidization to the internal surface of the copper pipes. Prevent moisture, dirt and any other contaminants to the interior of pipes and air conditioning units during installation. Pressure test pipework with dry nitrogen as recommended by the manufacturer after installation and prior to connection of the outdoor units, sealing of insulation joints and starting the outdoor unit. Evacuate entire system to vacuum pressure as recommended by the manufacturer once the outdoor units are connected. Fill the system with refrigerant in accordance with the requirements of the manufacturer after completion of the above process.

H. Wiring:

1. Furnish and install all control wiring, and associated accessories in accordance with manufacturer’s written instructions.

3.2 CONNECTIONS

A. Where piping is installed adjacent to unit, allow space for service and maintenance of unit.

B. Duct Connections: Duct installation requirements are specified in Section 233113 "Metal Ducts." Drawings indicate the general arrangement of ducts. Connect supply and return ducts to indoor units with flexible duct connectors. Flexible duct connectors are specified in Section 233300 "Air Duct Accessories."

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a locally qualified, factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

B. Perform tests and inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

C. Tests and Inspections:

1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
2. Operational Test: After electrical circuitry has been energized, start the systems to confirm proper operation.
3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

D. Remove and replace malfunctioning units and retest as specified above.

E. Prepare test and inspection reports.

3.4 STARTUP SERVICE

A. Manufacturer's Representative must provide start-up and commissioning along with local hands-on training..

1. Complete installation and startup checks according to manufacturer's written instructions.

2. Manufacturer's Representative to conduct complete systems re-commissioning at one year of operation.

B. CONSTANT MONITORING SERVICE

C. All systems shall be maintained by equipment manufacturer's continual monitoring service.
1. Optimize system operation with Variable Refrigerant Temperature, in response to system loads and streaming local weather forecasting, calculating real time control strategy.
2. Constantly monitor at least 80 points within the systems' operation in 24/7 real time via OEM's Cloud service and analysis.
3. Provide predictive maintenance monitoring and alerts continually during operation.
4. Installation with first year quarterly reporting and analysis. Owner opts to subscribe for second year forward annual, semi-annual or quarterly reporting.

3.5 DEMONSTRATION

A. Manufacturer's representative shall support installing contractor by providing its own factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain units on site and in local live equipment training laboratory.

B. Refer Division 01 for administrative and procedural requirements for demonstration and training.

END OF SECTION 238126

SECTION 23 81 30.11 – VARIABLE REFRIGERANT VOLUME (VRV) HVAC SYSTEM CONTROLS

PART 1 – GENERAL

1.1. Physical characteristics

A. General:
The local remote control shall be made from plastic materials with a neutral color. Each control shall have a LCD (Liquid Crystal Display) that shows set point, room temperature, mode of operation (on/off/cool/heat), and fan speed.

1.2. Electrical characteristics

A. General:
The each indoor unit control circuit board shall supply 16 volts DC to the local remote controller. The voltage may rise or fall in relation to the transmission packets that are sent and received.

B. Wiring:
The control wiring shall be terminated in a daisy chain design from outdoor unit, to branch selector, then daisy chaining to each indoor unit in the system and terminating at the farthest indoor unit. The remote control wiring shall run from the indoor unit control board terminal block to the remote controller connected with that indoor unit.

C. Wiring size:
Wiring shall be non-shielded, 2-conductor sheathed vinyl cord or cable, and 18 AWG stranded copper wire.

1.3. VRV Controls Network

The VRV Controls Network shall be made up of local remote controllers, multi-zone controllers, advanced multi-zone controllers, and open protocol software devices that transmit information via the high-speed communication bus and can also be controlled via a network PC. The VRV Controls Network supports operation monitoring, scheduling, error e-mail distribution, general user software, tenant billing, maintenance support, and integration with Building Management Systems (BMS) using open protocol via BACnet® or Lonworks® interfaces; all of which blend to provide the optimal control strategy for the best HVAC comfort solution.

PART 2 - PRODUCTS

2.1. Local Remote Controllers

VRV local remote controllers shall be compatible with all VRV indoor units. The remote controller wiring shall consist of a non-polar two-wire connection to the indoor unit. The local remote controllers may be wall-mounted and can be adjusted to maintain the optimal operation of the connected indoor unit(s). Set temperatures can be adjusted in increments of 1°F. In the cases where a system or unit error may occur, the VRV controllers will display a two-digit error code and the unit address. The local remote controllers do not require addressing.

A. Remote Controller

The Remote Controller shall provide control for all VRV indoor units. The remote controller wiring consist of a non-polar two-wire connection to the indoor unit at terminals P1/P2. The Remote Controller is wall mounted and can be adjusted to maintain the optimal operation of the connected indoor unit(s). The Remote Controller does not require addressing.

The Remote Controller can be used in conjunction with the BRC2A71 (Simplified Remote Controller) or another NAV Remote Controller to control the same indoor unit group. No more than 2 remote controllers can be placed in the same group.

1. Mounting:
   The Remote Controller shall be mounted into a standard 2" x 4" junction box.

2. Display Features:
   - The Remote Controller shall be approximately 4.75" x 4.75" in size with a backlit 2.75" x 1.75" LCD display.
   - Feature Backlit LCD Display with contrast adjustment and auto off after 30 seconds.
   - Display information shall be selectable from English, French, or Spanish.
   - Configurable display mode – Detailed, Standard, and Simple
     - Large 11/16" room temperature displayed in Simple display
   - The controller shall display Operation Mode, Setpoint, and Fan Speed.
     - Displayed items configurable
     - Configure "Off" to be displayed when unit is turned off (field setting required)
       - Prevents mode adjustment
     - Setpoint can be removed from display when unit is turned Off (field setting required)
       - Prevents setpoint adjustment
     - Fan speed display removable (field setting required)
       - Prevents fan speed adjustment
   - System Status icons.
   - The controller shall display temperature setpoint in one degree increments with a range of 60-90^{o}F (16-32^{o}C)
   - Detailed and Simple display will reflect room temperature (0-176^{o}F/-18-80^{o}C range in one degree increment).
     - Display of temperature information shall be configurable for Fahrenheit or Celsius
   - On/Off status shall be displayed with an LED.
   - Error codes will be displayed in the event of system abnormality/error with a two digit code.
     - A blinking LED will also signal system abnormality/error
   - The following system temperatures can be displayed to assist service personnel in troubleshooting:
     - Return Air Temperature
     - Liquid Line Temperature
     - Gas Line Temperature
     - Discharge Air Temperature (depending on unit),
     - Remote Controller Sensor Temperature
     - Temperature used for Indoor Unit Control

3. Basic Operation:
   - Capable of controlling a group of up to 16 indoor units.

- Controller shall control the following group operations:
  - On/Off, Operation Mode (Cool, Heat, Fan, Dry and Auto* (*with VRV Heat Recovery))
    - Configure only the essential modes to be selectable – remove unnecessary mode selection(s) from display
  - Independent Cooling and Heating setpoints in the occupied mode
    - Dual setpoints (individual Cool and Heat setpoints with minimum setpoint differential 0 – 8°F (0 – 4°C) default 2°F (1°C)) or Single setpoint
  - Independent Cooling Setup and Heating Setback setpoints in the unoccupied mode
  - Fan Speed
  - Airflow direction (dependent on indoor unit type).
  - The controller shall be able to limit the user adjustable setpoint ranges individually for cooling and heating in the occupied period
  - Function button lockout (On/Off, Mode, Fan Speed, Up/Down, Left, Right Arrows)
  - Indoor Unit group assignment
  - Clock (12/24 hour) and Day display
  - Automatic adjustment for Day Light Savings Time (DST)
    - Set changeover period (second Sunday in March / first Sunday in November)

4. Programmability:
   - Controller shall support schedule settings with selectable weekly pattern options.
     - 7-day
     - Weekday + Weekend
     - Weekday + Saturday + Sunday
     - Everyday
     - The schedule shall support unit On/Off
     - Independently settable Cooling and/or Heating setpoints when unit is on (occupied)
     - Setup (Cooling) and Setback (Heating) setpoints when unit is off (unoccupied)
     - A maximum of 5 operations can be schedulable per day
     - Time setting in 1-minute increments
   - The Controller shall support auto-changeover mode for both Heat Pump and Heat Recovery systems allowing the optimal room temperature to be maintained by automatically switching the indoor unit's mode between Cool and Heat according to the room temperature and temperature setpoint.
     - Changeover to cooling mode shall occur at cooling setpoint + 1°F (0.5°C) as the primary changeover deadband and takes the guard timer into consideration
       - Configurable from 1 – 4°F (0.5 – 2°C)
     - Changeover to cooling mode shall occur at the primary changeover deadband to cooling + 1°F (0.5°C) as the secondary changeover deadband.
       - Configurable from 1 – 4°F (0.5 – 2°C)
     - Changeover to heating mode shall occur at heating setpoint - 1°F (0.5°C) as the primary changeover deadband and takes the guard timer into consideration
       - Configurable from 1 – 4°F (0.5 – 2°C)

- Changeover to heating mode shall occur at the primary changeover deadband to heating - 1°F (0.5°C) as the secondary changeover deadband.
  - Configurable from 1 – 4°F (0.5 – 2°C)
- 1 hour guard timer
  - Upon changeover, guard timer will prevent another changeover during this period.
  - Guard timer is ignored by a change of setpoint manually from either the Multi-zone Controller, Remote Controller, or by schedule.
  - The Guard timer is also ignored if the space temperature reaches the secondary changeover deadband (configurable from 1 - 4°F (0.5 – 2°C)) from the primary changeover deadband, and the guard timer has been activated
  - 60 minutes as default, configurable to 15, 30, or 90 minutes

- The Controller shall support an Auto Off Timer for temporarily enabling indoor unit operation during the unoccupied period.
  - When the Off Timer is enabled and when the unit is manually turned on at the remote controller
  - The controller shall shut off the unit after a set time period
  - The time period shall be configurable in the controller menu with a range of 30-180 minutes in 10 minute increments
- The room temperature shall be capable of being sensed at either the NAV Remote Controller, the Indoor Unit return air temperature sensor (default), or Remote Temperature Sensor (KRCS01-1B) configured through the field settings.

B. Remote Temperature Sensor

The Remote Temperature Sensor shall provide temperature sensing for all VRV indoor units. The remote controller wiring consists of a non-polar two-wire connection to the indoor unit at terminals X13A. The Remote Temperature Sensor is wall mounted and is used to maintain the optimal operation of the connected indoor unit.

The Remote Temperature Sensor can be used in conjunction with the Navigation Remote Controller, Simplified Remote Controller, and the Wireless Remote Controller to sense space temperature outside of the indoor unit. No more than 2 remote controllers can be placed in the same group.

1. Mounting:
   - Sensor Box shall be 2.38” x 1.97” x 0.75” (H x W x D) in size.
   - Can be mounted on the wall in the provided sensor box.
   - Can be mounted in the Simplified Remote Controller (BRC2A71).
   - Can be mounted a button temperature sensor holder (field supplied).

2. Application:

   The location of the temperature sensor should provide a realistic sample of the space temperature in order to provide the optimum comfort level to the occupants.
   - Things that need to be considered are:
     - Indoor unit location
     - Will outside area be brought into the space and/or indoor unit
     - Ceiling heights
     - Control Scheme
     - Design and limitations due to architecture

- Plenum air return

3. Basic Operation:
   - Replaces indoor unit return air temperature sensor.
     - Senses room temperature for only one indoor unit

2.2. Advanced Multi-zone Controllers

The VRV advanced multi-zone controllers shall be compatible with all VRV, SkyAir, and Daikin RA and FTXS indoor units with the use of the KRP928BB2S RA Adapter. The advanced multi-zone controller wiring consist of a non-polar two-wire connection to the outdoor unit. The advanced multi-zone controllers may be wall-mounted and can be adjusted to maintain the optimal operation of up to 64 connected indoor unit groups and 128 indoor units. Set temperatures can be adjusted in increments of 1°F. In the cases where a system or unit error may occur, the VRV controllers will display a two-digit error code and the unit address.

A. DCM601A71: intelligent Touch Manager (iTM) V. 2.0 (Basis of Design)
The intelligent Touch Manager (version 2.0) shall provide control for all VRV, SkyAir, and Daikin RA and FTXS indoor units with the use of the KRP928BB2S RA Adapter. It shall be capable of controlling a maximum or 64 indoor unit groups and 128 indoor units connected to a maximum of 10 outdoor units. The intelligent Touch Manager shall support operations superseding that of the local remote controller, system configuration, daily/weekly scheduling, monitoring of operation status, and malfunction monitoring.

The controller wiring shall consist of a non-polar two-wire connection to the indoor unit at terminals F1F2 (out-out) of the outdoor unit. The intelligent Touch Manager is wall mounted and can be adjusted to maintain the optimal operation of the connected indoor unit(s).

The intelligent Touch Manager can be used in conjunction with the BRC1E71/72 (Navigation Remote Controller), the BRC2A71 (Simplified Remote Controller), or the BRC4C82/7E83/7C812/7E818 (Wireless Remote Controller), BACnet, and Lonworks interfaces to control the same indoor unit groups. The remote controller shall require daisy chain wiring for grouping multiple indoor units (up to 16) together. Manual addressing is required of each remote controller group associated with the intelligent Touch Manager. DIII-NET address can be set for one (1) indoor unit or each indoor unit in the remote controller group. No more than 2 remote controllers can be placed in the same group.

The intelligent Touch Manager shall be equipped with two RJ-45 Ethernet ports for 100 Mbps network communication to support interconnection with a network PC via the Internet, Local Area Network (LAN), or connection with a non-networked PC after completed installation.

Web access functions shall be available so that facility staff can securely log into each Intelligent Touch Manager via the PC's web browser to support monitoring, scheduling, error recognition, and general user functions. Error emais are also sent to designated email addresses. An additional optional software function Power Proportional Distribution (PPD) tenant billing shall also be available. The optional software shall require advanced purchase and can only be activated upon receipt of a license activation key from Daikin AC.

1. Mounting:

The intelligent Touch Manager shall be mounted on the wall or into the mounting fixtures included with the intelligent Touch Manager.

2. Display Features:
   a. The intelligent Touch Manager shall be approximately 11.42" x 9.57" x 1.97' in size with a backlit 10.4" LCD display.
   b. Display information shall be selectable from English, French, Italian, Korean, Dutch, Portuguese, Chinese, Japanese, German, or Spanish.
   c. Featured backlit LCD with auto off after 30 minutes (default) is adjustable between 1 to 60 minutes, or the choice of 3 different screen savers.
   d. Area and Group configuration
      1) Area contains one (1) or more Area(s) or Group(s)
      2) A Group may be an indoor unit, Di, Dio point that has a DIII-NET address
      3) A Group may be an external management point such as a Di, Do, Ai, or Ao that does not have a DIII-NET address
   e. An Area is a tiered group where management points (indoor unit, digital input/output, and analog input/output groups) can be monitored and controlled by global settings. Up to 650 Areas can be created. Area hierarchy can have up to 10 tiered levels (ex. top level: 1st floor West, 2nd level: offices, hallways, 3rd level: Office 101, 102, and 103, etc.). Area configuration shall classify levels of monitoring and control for each management point
      1) Areas and Groups may be assigned names (ex. Office 101, Lobby, North Hallway, etc.)
   f. The Controller shall display On/Off, Operation Mode, Setpoint, Space Temperature, Louver Position, Fan Speed for each Area or Group.
   g. The Controller shall display Date (mm/dd/yyyy, yyyy/mm/dd, or dd/mm/yyyy format selectable) and day of the week along with the time of day (12hr or 24hr display selectable).
   h. The Controller shall adjust for daylight savings time (DST) automatically.
   i. Display information shall be updated every 3 seconds to show the latest status of the indoor unit groups.
   j. System status icons shall display On/Off (color coded), Malfunction/Error (color coded), Forced Stop, Setback, Filter, Maintenance, and Screen Lock.
   k. The controller shall display the temperature setpoint in one degree increments with a range of 60°F – 90°F, 1°F basis (16°C – 32°C, 0.1°C basis).
      1) Display of temperature setpoint information shall be configurable for Fahrenheit or Celsius
   l. Display shall reflect room temperature in one tenth degree increments with a range of-58°F – 248°F, 0.1°F basis (-50°C – 120°C, 0.1°C basis) with 0.1°C accuracy.
      1) Display of room temperature information shall be configurable for Fahrenheit or Celsius
   m. The Menu List shall be used to configure options and display information for each Area or Group.
   n. Error status shall be displayed in the event of system abnormality/error with one of three color coded icons placed over the indoor unit icon or lower task bar.
      1) System errors are generated when the intelligent Touch Manager system with other VRV controls systems are combined incorrectly or power proportional distribution calculation errors occur. The intelligent Touch Manager shall display the error with a red triangle placed on the lower task bar.
      2) Unit errors occurring within the VRV system shall be displayed with a yellow triangle placed over the indoor unit icon
      3) Limit errors are based upon preconfigured analog input upper and lower limit settings and are generated when the limits have been met. When limit error is generated a yellow triangle will be placed over the unit icon.

4) Communication errors between the intelligent Touch Manager and the indoor units shall be displayed with a blue triangle placed over the indoor unit icon
5) Error history shall be available for viewing for up to 500,000 errors/abnormality events with operation events.

o. Layout View
1) Capable of displaying site floor plan as the background for visual navigation. Indoor unit, DIII-NET Di and Dio, and External Di, DO, Ai, and Ao icons with operational status can be placed on the floor layout
i) Up to 4 status points can be assigned to the indoor unit icon (room name, room temperature, setpoint, and mode)
ii) Digital input and output icons will display On/Off status
iii) Analog input icons will display analog value
2) Up to 60 floor layout sections can be created

3. Basic Operation:
a. Capable of controlling by Area(s) or Group(s)
b. Controller shall control the following group operations:
1) On/Off
2) Operation Mode (Cool, Heat, Fan, Dry, and Auto)
3) Independent Cool and Heat dual Setpoints or single Setpoint for current mode in the occupied period
4) Controller shall be able to limit the user adjustable setpoint ranges individually for cooling and heating based upon the Area or Group configurations
5) Independent Setup (Cooling) and Setback (Heating) setpoints in the unoccupied mode adjustable to 50 - 95^{0}F
i) Setup and Setback setpoints can only be set outside of the occupied setpoint range
ii) The Setup and Setback setpoints will automatically maintain a 2^{o}F fixed differential from the highest possible occupied setpoints
iii) The recovery differential shall be 4^{0}F (default) and adjustable between 2 – 10^{0}F
iv) Settings shall be applied based upon the Area or Group configurations
6) Fan Speed
i) Up to 3 speeds (dependent upon indoor unit type)
7) Airflow direction (dependent upon indoor unit type)
i) 5 fixed positions or oscillating
8) Remote controller permit/prohibit of On/Off, Mode, and Setpoint
9) Lock out setting for Intelligent Touch Manager display
10) Indoor unit Group/Area assignment
c. Capable of providing battery backup power for the clock at least 1 year when no AC power is applied.
1) The battery can last at least 13 years when AC power is applied
2) Settings stored in non-volatile memory

4. Programmability:
a. Controller shall support weekly schedule settings.
1) 7 day weekly pattern (7)
2) Weekday + Weekend (5 + 2)
3) Weekday + Saturday + Sunday (5 + 1 + 1)
4) Everyday (1)
5) The schedule shall have the capabilities of being enabled or disabled
6) 100 independent schedules configurable with up to 20 events settable for each days schedule
i) Each scheduled event shall specify time and target Area or Group

ii) Each scheduled event shall include On/Off, Optimum Start, Operation Mode, Occupied Setpoints, Setback Setpoints, Remote Controller On/Off Prohibit, Remote Controller Mode Prohibit, Remote Controller Setpoint Prohibit, Timer Extension Setting, Fan Speed, and Setpoint Range Limit
- Setpoint when unit is On (occupied)
- Configurable Setup (Cooling) and Setback (Heating) setpoints when unit is Off (unoccupied)

iii) Time setting in 1-minute increments
iv) Timer Extension shall be used for a timed override (settable from 30 – 180 minutes) to allow indoor unit operation during the unoccupied period

7) A maximum of 40 exception days can be schedule on the yearly schedule (repeats yearly)
i) Exception days shall be used to override specified days on the weekly schedule based upon irregular occupied/unoccupied conditions
ii) Exception days can be configured on a set date (Jan 1) or floating date (1st Monday in September)

b. Controller shall support auto-changeover.
1) Auto-change shall provide Fixed (default), Individual, Averaging, and Vote changeover methods for both Heat Pump and Heat Recovery systems based upon the changeover group configuration. This will allow for the optimal room temperature to be maintained by automatically switching the indoor unit's mode between Cool and Heat in accordance with the room temperature and setpoint. The following changeover scheme shall be applicable to the Fixed, Individual, and Averaging methods.
i) Changeover to cooling mode shall occur at cooling setpoint + 1°F (0.5°C) as the primary changeover deadband and takes the guard timer into consideration
- Configurable from 1 – 4°F (0.5 – 2°C)

ii) Changeover to cooling mode shall occur at the primary changeover deadband to cooling + 1°F (0.5°C) as the secondary changeover deadband.
- Configurable from 1 – 4°F (0.5 – 2°C)

iii) Changeover to heating mode shall occur at heating setpoint - 1°F (0.5°C) as the primary changeover deadband and takes the guard timer into consideration
- Configurable from 1 – 4°F (0.5 – 2°C)

iv) Changeover to heating mode shall occur at the primary changeover deadband to heating - 1°F (0.5°C) as the secondary changeover deadband.
- Configurable from 1 – 4°F (0.5 – 2°C)

v) A weighted demand shall be configurable for the Averaging and Vote methods.

2) Fixed Method
i) Changeover evaluated by room temperature and setpoint of the representative indoor unit (first registered indoor unit in changeover group) in the changeover group even when it is not operating (must be in Cool, Heat, or Auto mode)
ii) Changeover affects all indoor unit groups in the changeover group.

3) Individual method (recommended for Heat Recovery Systems)
i) Changeover evaluated by room temperature and setpoints of the individual indoor unit group in the changeover group
ii) Changeover affects individual indoor unit group in the changeover group

4) Average method
i) Changeover evaluated by the average of all indoor unit group's room temperatures and setpoints operating in Cool, Heat, or Auto mode in the changeover group list

ii) If none of the indoor units in the group meet the above requirements the Fixed method of changeover will be applied
iii) A weighted demand (0 – 3) can be configured for each indoor unit in the changeover group.
iv) Changeover affects all indoor unit groups in the changeover group.

5) Vote Method
i) In each indoor unit, the cooling demand is calculated based upon the difference between the room temperature and cooling setpoint. If the room temperature falls below the primary cool changeover point (cool setpoint plus the primary changeover deadband) the cooling demand is considered as 0 (zero). Then the total cooling demand is calculated as the sum of each indoor unit's cooling demand
ii) The opposite is true for the total heating demand
iii) A weight (0-3) can be added to each indoor unit's demand in the changeover group. The default setting is 1
iv) The weight 0 (zero) means the indoor unit's demand is not added in the total demand, so the indoor unit's demand is considered to be 0 (zero)
v) The weight 2 or 3 means the indoor unit's demand is added 2 or 3 times in the total demand, respectively
vi) Changeover to cooling mode shall occur when the total cooling demand is greater than the total heating demand.
vii) The opposite is true for changeover to heating
viii) Vote supports a Heating Override option, which prioritizes switching to the heating mode if at least one room temperature falls below the secondary heat changeover point (heat setpoint minus the secondary changeover deadband) even if the total cooling demand is greater than the total heating demand.
ix) Changeover affects all indoor unit groups in the changeover group.

6) Changeover shall change the operation mode of the indoor unit that is set as the Changeover Master. The Changeover Master indoor unit shall then change the operation mode of all indoor unit groups daisy chained to the same outdoor unit in the Heat Pump system or branch selector box in the Heat Recovery system.
7) Guard timer
i) Upon changeover, guard timer will prevent another changeover during the guard timer activation period (15, 30, 60 (default) min).
ii) Guard timer is ignored by a change of setpoint manually from either intelligent Touch Manger or Remote Controller, by schedule, or the room temperature meets or exceeds the secondary changeover deadband of the mode opposite of the current mode setting

c. Controller shall support Interlock
1) Interlock feature for use with 3rd party equipment (DOAS, dampers, occupancy sensing, etc…) to automatically control Groups or Areas corresponding to the change of the operation states or the On/Off states of any Group.
2) WAGO I/O unit – Di, Do, Ai, Ao
i) On/Off based monitoring and control of equipment
ii) Manual or scheduled operation of equipment
iii) Operation based upon interlock with management points (group(s))
iv) Monitor equipment error/alarm status
3) Digital Input/Output (DEC102A51-US2) unit or Digital Input (DEC101A51-US2) unit
i) On/Off based monitoring and control of equipment
ii) Manual or scheduled operation of equipment

iii) Operation based upon interlock with management points (group(s))
iv) Monitor equipment error/alarm status

d. Controller shall support force shutdown of associated indoor unit groups.

5. Web/Email Function
   a. Each intelligent Touch Manager shall be capable of monitoring, operating, and scheduling a maximum of 64 indoor unit groups (up to 512 indoor unit groups with the addition of the iTM Plus Adapter) from a networked PC's web browser. It shall also be capable of creating general user access and sending detailed error emails to a customized distribution list (up to 10 email addresses).
   b. All PCs shall be field supplied

PART 3 - WARRANTY

3.1 Special Warranty: Manufacturer and Installer shall agree to repair or replace in part or entirety any component that fail in materials or workmanship within a specified warranty period. Verified available warranties and warranty periods for units and components shall be provided to owner.

1. Warranty Period: Five years from date of Substantial Completion.

SECTION 23 82 16.14 - COILS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes electric resistance air coils.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each air coil.
2. Include rated capacities, operating characteristics, and pressure drops for each air coil.

B. Shop Drawings: Include diagrams for power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which coil location and ceiling-mounted access panels are shown and coordinated with each other.

B. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For air coils to include in operation and maintenance manuals.

1.6 FIELD CONDITIONS

A. Altitude above Mean Sea Level: 0 feet**.**

PART 2 - PRODUCTS

2.1 DESCRIPTION

A. ASHRAE Compliance: Comply with applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."

2.2 COILS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Chromalox Inc..
2. Indeeco.
3. Trane Company (The); Unitary Products Group.

A. Testing Agency Listing and Labeling: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Coil Assembly: Comply with UL 1995.

C. Heating Elements: Open-coil resistance wire of 80 percent nickel and 20 percent chromium, supported and insulated by floating ceramic bushings recessed into casing openings, and fastened to supporting brackets.

D. High-Temperature Coil Protection: Disk-type, automatically reset, thermal-cutout, safety device; serviceable through terminal box without removing heater from duct or casing.

1. Secondary Protection: Load-carrying, manually reset or manually replaceable, thermal cutouts; factory wired in series with each heater stage.

E. Frames: Galvanized-steel channel frame, minimum 0.052 inch thick for slip-in or flanged mounting.

F. Control Panel: Unit mounted with disconnecting means and overcurrent protection. Include the following controls:

1. Magnetic contactor.
2. Mercury contactor.
3. Toggle switches; one per step.
4. Step controller.
5. Time-delay relay.
6. Pilot lights; one per step.
7. Airflow proving switch.

G. Capacities and Characteristics: As indicated on Drwaings.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine ducts, plenums, and casings to receive air coils for compliance with requirements for installation tolerances and other conditions affecting coil performance.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install coils level and plumb.

B. Install coils in metal ducts and casings constructed according to SMACNA's "HVAC Duct Construction Standards, Metal and Flexible."

C. Clean coils using materials and methods recommended in writing by manufacturers, and clean inside of casings and enclosures to remove dust and debris.

3.3 CONNECTIONS

A. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."

B. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

3.4 FIELD QUALITY CONTROL

A. Perform the following tests and inspections with the assistance of a factory-authorized service representative:

1. Operational Test: After electrical circuitry has been energized, operate electric coils to confirm proper unit operation.
2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

B. Prepare test and inspection reports.

END OF SECTION 238216.14

SECTION 23 82 39 - UNIT HEATERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Cabinet unit heaters with centrifugal fans and electric-resistance heating coils.
2. Propeller unit heaters with electric-resistance heating coils.

1.3 DEFINITIONS

A. BAS: Building automation system.
B. CWP: Cold working pressure.
C. PTFE: Polytetrafluoroethylene plastic.
D. TFE: Tetrafluoroethylene plastic.

1.4 SUBMITTALS

A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories for each product indicated.

B. Field quality-control test reports.

C. Operation and Maintenance Data: For cabinet unit heaters to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1-2004, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."

C. ASHRAE/IESNA 90.1-2004 Compliance: Applicable requirements in ASHRAE/IESNA 90.1-2004, Section 6 - "Heating, Ventilating, and Air-Conditioning."

1.6 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of unit heaters that fail in materials or workmanship for not less than a period of two years.

1.7 MAINTENANCE SPARE PARTS

A. Spare parts: Manufacturer's recommended quantity, but not less than 10% of all replacement parts, with a minimum quantity of one each.

PART 2 - PRODUCTS

2.1 CABINET UNIT HEATERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Berko Electric Heating; a division of Marley Engineered Products.
   2. Indeeco.
   3. QMark Electric Heating; a division of Marley Engineered Products.
   4. Trane.

B. Description: A factory-assembled and -tested unit complying with ARI 440.

   1. Comply with UL 2021.

C. Cabinet: Steel with baked-enamel finish with manufacturer's standard paint, in color selected by City/Engineer.

   1. Vertical Unit, Exposed Front Panels: Minimum 0.1 inch thick, galvanized, sheet steel, removable panels with channel-formed edges secured with tamperproof cam fasteners.

   2. Control Access Door: Key operated.

   3. Base: Minimum 0.1-inch thick steel, finished to match cabinet, 4 inches (100 mm) high with leveling bolts.

   4. False Back: Minimum 0.0428-inch- (1.1-mm-) thick steel, finished to match cabinet.

D. Electric-Resistance Heating Coil: Nickel-chromium heating wire, free from expansion noise and hum, mounted in ceramic inserts in a galvanized-steel housing; with fuses in terminal box for over current protection and limit controls for high-temperature protection. Terminate elements in stainless-steel machine-staked terminals secured with stainless-steel hardware.

E. Fan and Motor Board: Removable.

   1. Fan: Forward curved, double width, centrifugal; directly connected to motor. Thermoplastic or painted-steel wheels, and aluminum, painted-steel, or galvanized-steel fan scrolls.

   2. Motor: Permanently lubricated, multispeed; resiliently mounted on motor board. Comply with requirements in Section 23 05 13 – Common Motor Requirements for HVAC Equipment.

   3. Wiring Terminations: Connect motor to chassis wiring with plug connection.

F. Basic Unit Controls:

   1. Control voltage transformer.

2. Unit-mounted thermostat and factory wired low voltage control circuit and contactors with the following features.
   a. Fan on-auto switch.
   b. Manual fan speed switch.
   c. Adjustable deadband.
   d. Concealed set point.
   e. Exposed indication.
   f. Deg F (Deg C) indication.

G. Electrical Connection: Factory wire motors and controls for a single field connection and disconnect.

H. Capacities and Characteristics: As indicated on drawings.

1. Cabinet:

   a. Vertical, Surface Mounted: Upflow.
      1) Top: Flat.
      2) Air Inlet: Front, punched louver grille.
      3) Air Outlet: Front punched louver.

2.2 PROPELLER UNIT HEATERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Airtherm; a Mestek Company.
2. Engineered Air Ltd.
3. McQuay International.
4. Rosemex Products.
5. Ruffneck Heaters; a division of Lexa Corporation.
6. Trane.
7. Markel Products; a division of TPI Corporation.

B. Description: An assembly including casing, coil, fan, and motor in horizontal/vertical discharge configuration with adjustable discharge louvers and mounting brackets dust shield. Test propeller unit heater before shipping.

C. Comply with UL 2021.

D. Comply with UL 823.

E. Cabinet: Removable panels for maintenance access to controls.

F. Cabinet Finish: Steel with baked-enamel finish with manufacturer's standard paint, color selected by City/Engineer.

G. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1-2004.

H. Discharge Louver: Adjustable fin diffuser for horizontal units and conical diffuser for vertical units.

I. Electric-Resistance Heating Elements: Nickel-chromium heating wire, free from expansion noise and 60-Hz hum, embedded in magnesium oxide refractory and sealed in steel or corrosion-resistant metallic sheath with fins no closer than 0.16 inch (4 mm). Element ends

shall be enclosed in terminal box. Fin surface temperature shall not exceed 550 deg F (288 deg C) at any point during normal operation.

1. Circuit Protection: One-time fuses in terminal box for overcurrent protection and limit controls for high-temperature protection of heaters.
2. Wiring Terminations: Stainless-steel or corrosion-resistant material.

J. Fan: Propeller type with aluminum wheel directly mounted on motor shaft in the fan venturi.

K. Fan Motors: Comply with requirements in Section 23 05 13 – Common Motor Requirements for HVAC Equipment.

1. Motor Type: Permanently lubricated.

L. Control Devices:

1. Unit-mounted thermostat and disconnect.

M. Capacities and Characteristics: As indicated on drawings.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas to receive unit heaters for compliance with requirements for installation tolerances and other conditions affecting performance.

B. Examine roughing-in for electrical connections to verify actual locations before unit heater installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install wall boxes in finished wall assembly; seal and weatherproof. Joint-sealant materials and applications are specified in Section 07 92 00 – Joint Sealants.

B. Install cabinet unit heaters to comply with NFPA 90A.

C. Install propeller unit heaters level and plumb.

D. Suspend propeller unit heaters from structure with all-thread hanger rods and spring hangers. Hanger rods and attachments to structure are specified in Section 23 05 29 – Hangers and Supports for HVAC Piping and Equipment. Vibration hangers are specified in Section 23 05 48 – Vibration and Seismic Controls for HVAC Piping and Equipment, or by manufacturer supplied mounting brackets and dust shields.

3.3 CONNECTIONS

A. Comply with safety requirements in UL 1995.

B. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems."

C. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust field-assembled components and equipment installation, including connections, and to assist in field testing. Report results in writing.

B. Perform the following field tests and inspections and prepare test reports:

1. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.

2. Operate electric heating elements through each stage to verify proper operation and electrical connections.

3. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.

C. Remove and replace malfunctioning units and retest as specified above.

3.5 ADJUSTING

A. Adjust initial temperature set points.

B. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

3.6 DEMONSTRATION

A. Engage a factory-authorized service representative to train Baltimore City maintenance personnel to adjust, operate, and maintain cabinet unit heaters.

B. Refer Division 01 for administrative and procedural requirements for demonstration and training.

Bid documents are available only online from eMaryland Marketplace (eMM). Those are the only official documents to be used by Bidders for this Invitation for Bid (IFB). The Bidders shall print on their own stationary the required documents for submitting their bid (as Construction BID Form, Bid Proposal Affidavit, BID Bond, etc.) and submit to the Owner (DPSCS, Division of Capital Construction and Facilities Maintenance) in a sealed envelope which clearly indicates that it contains a sealed bid for this project with the bid due date and the name and address of the Bidder.

Minority Business Enterprises (MBEs) are encouraged to participate and respond to this request for Bid.

CONFORMED DOCUMENT 3 APRIL 2015: This project manual contains sections revised during bidding, and is published for the Contractor's convenience for use during construction. It does not replace the Contract Documents, which comprise the Bid Documents plus revisions issued as Addenda.

SECTION 26 05 13 - MEDIUM-VOLTAGE CABLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes cables and related splices, terminations, and accessories for medium-voltage electrical distribution systems.

B. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.

2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners

1.3 DEFINITIONS

A. NETA ATS: Acceptance Testing Specification.

1.4 MRc2: CONSTRUCTION WASTE MANAGEMENT

A. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 018113 Sustainable Design Requirements.

B. EQc4.1: LOW-EMITTING MATERIALS – SEALANTS AND ADHESIVES

All sealants, adhesives, and sealant primers used on the interior of the building shall comply with the project requirements for Low-Emitting Materials – Sealants and Adhesives. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

1.5 SUBMITTALS

A. Product Data: For each type of cable indicated. Include splices and terminations for cables and cable accessories.

B. Qualification Data: For Installer and testing agency.

C. Material Certificates: For each cable and accessory type, signed by manufacturers.

D. Source quality-control test reports.

E. Field quality-control test reports.

1.6 QUALITY ASSURANCE

A. Installer: Engage a cable splicer, trained and certified by splice material manufacturer, to install, splice, and terminate medium-voltage cable.

B. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated, that is a member company of the InterNational Electrical Testing Association or is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to authorities having jurisdiction.

1. Testing Agency's Field Supervisor: Person currently certified by the InterNational Electrical Testing Association or the National Institute for Certification in Engineering Technologies to supervise on-site testing specified in Part 3.

C. Source Limitations: Obtain cables and accessories through one source from a single manufacturer.

D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

E. Comply with IEEE C2 and NFPA 70.

1.7 WARRANTY

A. Special Project Warranty: Submit a written warranty, mutually executed by manufacturer and the principal Installer, agreeing to repair or replace medium-voltage cables, splices, and terminations that fail in materials or workmanship within the special project warranty period specified below. This warranty shall be in addition to, and not a limitation of, other rights and remedies the Authority may have against the Contractor under the Contract Documents.

B. Special Project Warranty Period: 20 years beginning on the date of Substantial Completion.

1.8 COMMISSIONING

A. The materials, components and systems described in this section are subject to the Commissioning process. Contractor must comply with all Commissioning Requirements. Commissioning Requirements are described in Section 019113 General Commissioning Requirements and in Division 36 Commissioning. Division 36 provides

an individual Commissioning specification section for each Division 2 through Division 33 specification section requiring Commissioning.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Cables:

   a. American Insulated Wire Corp.; a Leviton Company.
   b. General Cable Technologies Corporation.
   c. Kerite Co. (The); Hubbell Incorporated.
   d. Okonite Company (The).
   e. Pirelli Cables & Systems NA.
   f. Rome Cable Corporation.
   g. Southwire Company.

2. Cable Splicing and Terminating Products and Accessories:

   a. Engineered Products Company.
   b. G&W Electric Company.
   c. MPHusky.
   d. Raychem Corp.; Telephone Energy and Industrial Division; Tyco International Ltd.
   e. RTE Components; Cooper Power Systems, Inc.
   f. Scott Fetzer Co. (The); Adalet.
   g. Thomas & Betts Corporation.
   h. Thomas & Betts Corporation/Elastimold.
   i. 3M; Electrical Products Division.

2.2 CABLES

A. Cable Type: Cable shall be single conductor type, size as indicated on contract drawing. Cable shall conform to UL Standard 1072, AEIC CS 8, ICEA S-93-639, ICEA S-97-682 and ASTM B8.

B. Conductor: Copper.

C. Conductor Stranding: Uncoated soft, Class B, stranded compressed concentric round. Copper shall conform to ASTM B8. Electrical resistance shall meet the requirements of ICEA S-93-639.

D. Strand Filling: Conductor interstices are filled with impermeable compound.

E. Conductor Insulation: Insulation shall be flexible thermosetting dielectric based on an Ethylene-propylene rubber. The insulation shall limit degree of susceptibility to treeing experienced by crystalline materials.

1. Voltage Rating: 15 kV.
2. Insulation Thickness: 133 percent insulation level.

F. Shielding: Copper shielding tape, 5 mil thick helically applied over semiconducting insulation shield with 12-1/2% overlap for all feeder circuits.

G. Jacket: Shall be black, sunlight resistant polyvinyl chloride with minimum average thickness of 80 mil. Minimum thickness shall not be less than 64 mil.

H. Cable Armor: Interlocked galvanized steel applied over cable.

2.3 SPLICE KITS

A. Connectors and Splice Kits: Comply with IEEE 404; type as recommended by cable or splicing kit manufacturer for the application.

B. Splicing Products: As recommended, in writing, by splicing kit manufacturer for specific sizes, ratings, and configurations of cable conductors. Include all components required for complete splice, with detailed instructions.

1. Combination tape and cold-shrink-rubber sleeve kit with rejacketing by cast-epoxy-resin encasement or other waterproof, abrasion-resistant material.
2. Heat-shrink splicing kit of uniform, cross-section, polymeric construction with outer heat-shrink jacket.
3. Premolded, cold-shrink-rubber, in-line splicing kit.
4. Premolded EPDM splicing body kit with cable joint sealed by interference fit of mating parts and cable.

C. Splices shall be made with standard splicing kits and shall be of the following types:

1. Separable insulated splice, 600 amps, 3 phase rated, with capacitive test point on molded T-body. Voltage rating of separable splice shall be 35 kV for use on 35 kV systems and 15kV for 15kV system. All current carrying components including the entire compression connector shall be copper.

2.4 SOLID TERMINATIONS

A. Conductor Terminations, General: Comply with Class 1, IEEE Standard 48. Insulation class shall be equivalent to that of the cable upon which they are installed. Terminations for shielded cables shall include a shield-grounding strap. Include an effective moisture seal for the end of the insulation whether or not this item is included in termination kits. Seal shall be silicone rubber tape, cold shrink rubber sleeve, or heat shrink plastic sleeve as recommended by the kit manufacturer. Termination kits shall be performance tested for compliance with IEEE Standard 48 and shall be of the following types:

1. Class 1 Termination for Shielded Cable: Modular type, furnished as a kit, with stress relief tube, multiple molded silicone rubber insulator modules, shield ground strap, and compression type connector.

2. Class 1 Termination for Shielded Cable: Heat shrinkable type with heat shrinkable inner stress control and outer non-tracking tubes, multiple molded non-tracking skirt modules, and compression type connector.
3. Separable insulated elbow connectors: Modular system, complying with IEEE Standard 386. System shall consist of disconnecting, 600A, 3 phase rated single pole, cable terminators and matching stationary, plug-in, dead front terminals. System components shall be designed for the system voltage and for sealing against moisture. Elbows shall include voltage test points on molded connector body. Voltage rating of separable elbow connectors shall be 15 kV for use on 15 kV systems. All current carrying components shall be copper.

2.5 ARC-PROOFING MATERIALS

A. Tape for First Course on Metal Objects: 10-mil thick, corrosion-protective, moisture-resistant, PVC pipe-wrapping tape.

B. Arc-Proofing Tape: Fireproof tape, flexible, conformable, intumescent to 0.3 inch thick, compatible with cable jacket.

C. Glass-Cloth Tape: Pressure-sensitive adhesive type, 1/2 inch wide.

2.6 SOURCE QUALITY CONTROL

A. Test and inspect cables according to ICEA S-97-682 before shipping.

B. Test strand-filled cables for water-penetration resistance according to ICEA T-31-610, using a test pressure of 5 psig.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install cables according to IEEE 576.

B. Pull Conductors: Do not exceed manufacturer's recommended maximum pulling tensions and sidewall pressure values.

1. Where necessary, use manufacturer-approved pulling compound or lubricant that will not deteriorate conductor or insulation.
2. Use pulling means, including fish tape, cable, rope, and basket-weave cable grips that will not damage cables and raceways. Do not use rope hitches for pulling attachment to cable.

C. Install exposed cables parallel and perpendicular to surfaces of exposed structural members and follow surface contours where possible.

D. Install cable splices at pull points and elsewhere as indicated; use standard kits.

E. Install terminations at ends of conductors and seal multiconductor cable ends with standard kits.

F. Install separable insulated-connector components as follows:

1. Protective Cap: At each terminal junction, with one on each terminal to which no feeder is indicated to be connected.
2. Portable Feed-Through Accessory: Three.
3. Standoff Insulator: Three.

G. Arc Proofing: Unless otherwise indicated, arc proof medium-voltage cable at locations not protected by conduit, cable tray, direct burial, or termination materials. In addition to arc-proofing tape manufacturer's written instructions, apply arc proofing as follows:
1. Clean cable sheath.
2. Wrap metallic cable components with 10-mil pipe-wrapping tape.
3. Smooth surface contours with electrical insulation putty.
4. Apply arc-proofing tape in one half-lapped layer with coated side toward cable.
5. Band arc-proofing tape with 1-inch wide bands of half-lapped, adhesive, glass-cloth tape 2 inches o.c.

H. Seal around cables passing through fire-rated elements according to Division 07 Section "Penetration Firestopping."

I. Ground shields of shielded cable at terminations, splices, and separable insulated connectors. Ground metal bodies of terminators, splices, cable and separable insulated-connector fittings, and hardware.

J. Identify cables according to Division 26 Section "Identification for Electrical Systems."

3.2 FIELD QUALITY CONTROL

A. Testing: Engage a qualified testing and inspecting agency to perform the following field tests and inspections and prepare test reports:

B. Perform the following field tests and inspections and prepare test reports:
1. Perform each visual and mechanical inspection and electrical test stated in NETA ATS. Certify compliance with test parameters.
2. After installing medium-voltage cables and before electrical circuitry has been energized, test for compliance with requirements.

C. Allow for torque witnessing of all medium voltage connections and terminations. Provide owner seven working days advance notice.

D. Cables: Perform the following tests on cables size 1/0 and larger, unless noted otherwise. Provide torque witness testing per this Specification.

1. Medium-Voltage Cables:

a. Perform visual and mechanical inspection as follows:

1) Inspect exposed sections for physical damage.
2) Verify cable is supplied and connected in accordance with single-line diagram.
3) Inspect for shield grounding, cable support, and termination.
4) Check for visible cable bends against ICEA or manufacturer's minimum allowable bending radius.
5) Inspect for proper fireproofing in common cable areas.

6) If cables are terminated through window-type CT's, make an inspection to verify that neutrals and grounds are properly terminated for proper operation of protective devices.
7) Visually inspect jacket and insulation condition.
8) Inspect for proper phase identification and arrangement.

b. Perform electrical tests as follows:

1) Perform a shield continuity test on each power cable by the ohmmeter method. Record ohmic value.
2) Perform an insulation-resistance test utilizing a megohmmeter with a voltage output of at least 2500 volts. Individually test each conductor with all other conductors and shields grounded. Test duration shall be one minute.
3) Perform a dc high-potential test on all cables. Adhere to all precautions and limits as specified in the applicable NEMA/ICEA Standard for the specific cable. Perform tests in accordance with ANSI/IEEE Std. 400. Test procedure shall be as follows, and the results for each cable test shall be recorded as specified herein. Test voltages shall not exceed 80% of cable manufacturer's factory test value or the maximum test voltage in NETA ATS. Overpotential tests shall not be performed until insulation-resistance levels are above minimum values.
    a) Current-sensing circuits in test equipment shall measure only the leakage current associated with the cable under test and shall not include internal leakage of the test equipment.
    b) Record wet- and dry-bulb temperatures or relative humidity and temperature.
    c) Test each section of cable individually.
    d) Individually test each conductor with all other conductors grounded. Ground all shields.
    e) Terminations shall be properly corona-suppressed by guard ring, field reduction sphere, or other approved methods as necessary.
    f) Ensure that the maximum test voltage does not exceed the limits for terminators specified in IEEE Standard 48 or Manufacturer's specification.
    g) Apply a dc high-potential test in at least five equal increments until maximum test voltage is reached. No increment shall exceed the voltage rating of the cable. Record dc leakage current at each step after a constant stabilization time consistent with system charging current.
    h) Raise the conductor to the specified maximum test voltage and hold for fifteen minutes. Record readings of leakage current at 30 seconds and one minute and at one-minute intervals thereafter.
    i) Reduce the conductor test potential to zero and measure residual voltage at discrete intervals.
    j) Apply grounds for a time period adequate to drain all insulation-stored charge.

c. Test Values:

1) Shielding must exhibit continuity. Investigate resistance values in excess of 10 ohms per 1000 feet of cable.

E. A graphic plot shall be made with leakage current (X axis) versus voltage (Y axis) at each increment. The step voltage slope shall be reasonably linear. Absorption slope shall be flat or negative. In no case shall slope exhibit a positive characteristic

F. Remove and replace malfunctioning units and retest as specified above.

END OF SECTION 260513

SECTION 26 05 19 - LOW-VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:

1. Building wires and cables rated 600 V and less.
2. Connectors, splices, and terminations rated 600 V and less.

B. Related Sections include the following:

1. Division 26 Section "Medium-Voltage Cables" for single-conductor and multiconductor cables, cable splices, and terminations for electrical distribution systems with 2001 to 35,000 V.
2. Division 27 Section "Communications Horizontal Cabling" for cabling used for voice and data circuits.
3. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
4. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 DEFINITIONS

A. EPDM: Ethylene-propylene-diene terpolymer rubber.

B. NBR: Acrylonitrile-butadiene rubber.

1.4 MRc2: CONSTRUCTION WASTE MANAGEMENT

A. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 018113 Sustainable Design Requirements.

B. EQc4.1: LOW-EMITTING MATERIALS – SEALANTS AND ADHESIVES

All sealants, adhesives, and sealant primers used on the interior of the building shall comply with the project requirements for Low-Emitting Materials – Sealants and Adhesives. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For testing agency.

B. Field quality-control test reports.

1.7 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. Comply with NFPA 70.

1.8 WARRANTY

A. Warranty Period: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 CONDUCTORS AND CABLES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Alcan Products Corporation; Alcan Cable Division.
2. American Insulated Wire Corp.; a Leviton Company.
3. General Cable Corporation.
4. Senator Wire & Cable Company.
5. Southwire Company.

B. Copper Conductors: Comply with NEMA WC 70.

C. Conductor Insulation: Comply with NEMA WC 70 for Types THHN-THWN **.**

D. Multiconductor Cable: Comply with NEMA WC 70 for metal-clad cable, Type MC, mineral-insulated, metal-sheathed cable, Type MI with ground wire.

2.2 CONNECTORS AND SPLICES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. AFC Cable Systems, Inc.
2. Hubbell Power Systems, Inc.
3. O-Z/Gedney; EGS Electrical Group LLC.
4. 3M; Electrical Products Division.
5. Tyco Electronics Corp.

B. Description: Factory-fabricated connectors and splices of size, ampacity rating, material, type, and class for application and service indicated.

PART 3 - EXECUTION

3.1 CONDUCTOR MATERIAL APPLICATIONS

A. Feeders: Copper. Solid for No. 10 AWG and smaller; stranded for No. 8 AWG and larger.

B. Branch Circuits: Copper. Solid for No. 10 AWG and smaller; stranded for No. 8 AWG and larger.

3.2 CONDUCTOR INSULATION AND MULTICONDUCTOR CABLE APPLICATIONS AND WIRING METHODS

A. Feeders Concealed in Ceilings, Walls, Partitions, and Crawlspaces: Type THHN-THWN, single conductors in raceway..

B. Feeders Concealed in Concrete, below Slabs-on-Grade, and Underground: Type THHN-THWN, single conductors in raceway.

C. Feeders Installed below Raised Flooring: single conductors in Metal-clad cable, Type MC.

D. Exposed Branch Circuits, Including in Crawlspaces: Type THHN-THWN, single conductors in raceway.

E. Branch Circuits Concealed in Ceilings, Walls, and Partitions: Type THHN-THWN, single conductors in raceway.

F. Branch Circuits Concealed in Concrete, below Slabs-on-Grade, and Underground: Type THHN-THWN, single conductors in raceway**.**

G. Branch Circuits in Cable Tray: Type THHN-THWN, single conductors in raceway.

H. Cord Drops and Portable Appliance Connections: Type SO, hard service cord with stainless-steel, wire-mesh, strain relief device at terminations to suit application.

I. Class 1 Control Circuits: Type THHN-THWN, in raceway.

J. Class 2 Control Circuits: Type THHN-THWN, in raceway.

3.3 INSTALLATION OF CONDUCTORS AND CABLES

A. Conceal cables in finished walls, ceilings, and floors, unless otherwise indicated.

B. Use manufacturer-approved pulling compound or lubricant where necessary; compound used must not deteriorate conductor or insulation. Do not exceed manufacturer's recommended maximum pulling tensions and sidewall pressure values.

C. Use pulling means, including fish tape, cable, rope, and basket-weave wire/cable grips, that will not damage cables or raceway.

D. Support cables according to Division 26 Section "Hangers and Supports for Electrical Systems."

E. Identify and color-code conductors and cables according to Division 26 Section "Identification for Electrical Systems."

3.4 CONNECTIONS

A. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

B. Make splices and taps that are compatible with conductor material and that possess equivalent or better mechanical strength and insulation ratings than unspliced conductors.

1. Use oxide inhibitor in each splice and tap conductor for aluminum conductors.

C. Wiring at Outlets: Install conductor at each outlet, with at least 6 inches of slack.

3.5 FIRESTOPPING

A. Apply firestopping to electrical penetrations of fire-rated floor and wall assemblies to restore original fire-resistance rating of assembly according to Division 07 Section "Penetration Firestopping."

3.6 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections and prepare test reports.

B. Perform tests and inspections and prepare test reports.

C. Tests and Inspections:

1. After installing conductors and cables and before electrical circuitry has been energized, test service entrance and feeder conductors, and conductors feeding the critical equipment and services for compliance with requirements.

2. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.

3. Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, and at 11 months after date of acceptance, perform an infrared scan of each splice in cables and conductors No. 3 AWG and larger. Remove box and equipment covers so splices are accessible to portable scanner.

    a. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
    b. Record of Infrared Scanning: Prepare a certified report that identifies splices checked and that describes scanning results. Include notation of deficiencies detected, remedial actiontaken, and observations after remedial action.

D. Test Reports: Prepare a written report to record the following:

1. Test procedures used.
2. Test results that comply with requirements.
3. Test results that do not comply with requirements and corrective action taken to achieve compliance with requirements.

E. Remove and replace malfunctioning units and retest as specified above.

END OF SECTION 260519

SECTION 26 05 26 - GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes: Grounding systems and equipment.

B. Section includes grounding systems and equipment, plus the following special applications:

1. Underground distribution grounding.
2. Ground bonding common with lightning protection system.

C. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 MRc2: Construction Waste Management

A. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 018113 Sustainable Design Requirements.

B. EQc4.1: LOW-EMITTING MATERIALS – SEALANTS AND ADHESIVES

All sealants, adhesives, and sealant primers used on the interior of the building shall comply with the project requirements for Low-Emitting Materials – Sealants and Adhesives. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Informational Submittals: Plans showing dimensioned as-built locations of grounding features specified in "Field Quality Control" Article, including the following:

1. Test wells.
2. Ground rods.
3. Ground rings.
4. Grounding arrangements and connections for separately derived systems.
5. Grounding for sensitive electronic equipment.

C. Qualification Data: For qualified testing agency and testing agency's field supervisor.

D. Field quality-control reports.

E. Operation and Maintenance Data: For grounding to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include the following:

a. Tests shall determine if ground-resistance or impedance values remain within specified maximums, and instructions shall recommend corrective action if values do not.

1.5 QUALITY ASSURANCE

A. Testing Agency Qualifications: Member company of NETA or an NRTL.

1. Testing Agency's Field Supervisor: Currently certified by NETA to supervise on-site testing.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

C. Comply with UL 467 for grounding and bonding materials and equipment.

PART 2 - PRODUCTS

2.1 CONDUCTORS

A. Insulated Conductors**:** Copper wire or cable insulated for 600 V unless otherwise required by applicable Code or authorities having jurisdiction.

B. Bare Copper Conductors:

1. Solid Conductors: ASTM B 3.
2. Tinned Conductors: ASTM B 33.
3. Bonding Cable: 28 kcmil, 14 strands of No. 17 AWG conductor, 1/4 inch in diameter.
4. Bonding Conductor: No. 4 or No. 6 AWG, stranded conductor.
5. Bonding Jumper: Copper tape, braided conductors terminated with copper ferrules; 1-5/8 inches wide and 1/16 inch thick.

2.2 CONNECTORS

A. Listed and labeled by an NRTL acceptable to authorities having jurisdiction for applications in which used and for specific types, sizes, and combinations of conductors and other items connected.

B. Bolted Connectors for Conductors and Pipes: Copper or copper alloy, pressure type with at least two bolts.

1. Pipe Connectors: Clamp type, sized for pipe.

C. Welded Connectors: Exothermic-welding kits of types recommended by kit manufacturer for materials being joined and installation conditions.

D. Bus-bar Connectors: Mechanical type, cast silicon bronze, solderless compression type wire terminals, and long-barrel, two-bolt connection to ground bus bar.

2.3 GROUNDING ELECTRODES

A. Ground Rods: Copper-clad; 3/4 inch by 10 feet in diameter.

B. Chemical-Enhanced Grounding Electrodes: Copper tube, straight or L-shaped, charged with

1. Termination: Factory-attached No. 4/0 AWG bare conductor at least 48 inches long.
2. Backfill Material: Electrode manufacturer's recommended material.

PART 3 - EXECUTION

3.1 APPLICATIONS

A. Conductors: Install solid conductor for No. 8 AWG and smaller, and stranded conductors for No. 6 AWG and larger unless otherwise indicated.

B. Underground Grounding Conductors: Install bare copper conductor, No. 2/0 AWG minimum.

1. Bury at least 24 inches below grade.

C. Isolated Grounding Conductors: Green-colored insulation with continuous yellow stripe. On feeders with isolated ground, identify grounding conductor where visible to normal inspection, with alternating bands of green and yellow tape, with at least three bands of green and two bands of yellow.

D. Grounding Bus: Install in electrical and telephone equipment rooms, in rooms housing service equipment, and elsewhere as indicated.

1. Install bus on insulated spacers 2 inches minimum from wall, 6 inches above finished floor unless otherwise indicated.

2. Where indicated on both sides of doorways, route bus up to top of door frame, across top of doorway, and down to specified height above floor; connect to horizontal bus.

E. Conductor Terminations and Connections:

1. Pipe and Equipment Grounding Conductor Terminations: Bolted connectors.
2. Underground Connections: Welded connectors except at test wells and as otherwise indicated.
3. Connections to Structural Steel: Welded connectors.

3.2 GROUNDING UNDERGROUND DISTRIBUTION SYSTEM COMPONENTS

A. Comply with IEEE C2 grounding requirements.

B. Grounding Manholes and Handholes: Install a driven ground rod through manhole or handhole floor, close to wall, and set rod depth so 4 inches will extend above finished floor. If necessary, install ground rod before manhole is placed and provide No. 1/0 AWG bare, tinned-copper conductor from ground rod into manhole through a waterproof sleeve in manhole wall. Protect ground rods passing through concrete floor with a double wrapping of pressure-sensitive insulating tape or heat-shrunk insulating sleeve from 2 inches above to 6 inches below concrete. Seal floor opening with waterproof, nonshrink grout.

C. Grounding Connections to Manhole Components: Bond exposed-metal parts such as inserts, cable racks, pulling irons, ladders, and cable shields within each manhole or handhole, to ground rod or grounding conductor. Make connections with No. 4 AWG minimum, stranded, hard-drawn copper bonding conductor. Train conductors level or plumb around corners and fasten to manhole walls. Connect to cable armor and cable shields according to written instructions by manufacturer of splicing and termination kits.

D. Pad-Mounted Transformers and Switches: Install two ground rods and ground ring around the pad. Ground pad-mounted equipment and noncurrent-carrying metal items associated with substations by connecting them to underground cable and grounding electrodes. Install tinned-copper conductor not less than No. 2 AWG for ground ring and for taps to equipment grounding terminals. Bury ground ring not less than 6 inches from the foundation.

3.3 EQUIPMENT GROUNDING

A. Install insulated equipment grounding conductors with all feeders and branch circuits.

B. Install insulated equipment grounding conductors with the following items, in addition to those required by NFPA 70:

1. Feeders and branch circuits.
2. Lighting circuits.
3. Receptacle circuits.
4. Single-phase motor and appliance branch circuits.
5. Three-phase motor and appliance branch circuits.
6. Flexible raceway runs.
7. Armored and metal-clad cable runs.

8. Busway Supply Circuits: Install insulated equipment grounding conductor from grounding bus in the switchgear, switchboard, or distribution panel to equipment grounding bar terminal on busway.
9. Rack-Mounted Electronic Equipment Circuits: Install insulated equipment grounding conductor in branch-circuit runs from equipment-area power panels and power-distribution units.
10. X-Ray Equipment Circuits: Install insulated equipment grounding conductor in circuits supplying x-ray equipment.

C. Air-Duct Equipment Circuits: Install insulated equipment grounding conductor to duct-mounted electrical devices operating at 120 V and more, including air cleaners, heaters, dampers, humidifiers, and other duct electrical equipment. Bond conductor to each unit and to air duct and connected metallic piping.

D. Water Heater, Heat-Tracing, and Antifrost Heating Cables: Install a separate insulated equipment grounding conductor to each electric water heater and heat-tracing cable. Bond conductor to heater units, piping, connected equipment, and components.

E. Isolated Grounding Receptacle Circuits: Install an insulated equipment grounding conductor connected to the receptacle grounding terminal. Isolate conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service unless otherwise indicated.

F. Isolated Equipment Enclosure Circuits: For designated equipment supplied by a branch circuit or feeder, isolate equipment enclosure from supply circuit raceway with a nonmetallic raceway fitting listed for the purpose. Install fitting where raceway enters enclosure, and install a separate insulated equipment grounding conductor. Isolate conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service unless otherwise indicated.

G. Signal and Communication Equipment: In addition to grounding and bonding required by NFPA 70, provide a separate grounding system complying with requirements in TIA/ATIS J-STD-607-A.

1. For telephone, alarm, voice and data, and other communication equipment, provide No. 4 AWG minimum insulated grounding conductor in raceway from grounding electrode system to each service location, terminal cabinet, wiring closet, and central equipment location.
2. Service and Central Equipment Locations and Wiring Closets: Terminate grounding conductor on a 1/4-by-4-by-12-inch grounding bus.
3. Terminal Cabinets: Terminate grounding conductor on cabinet grounding terminal.

H. Metal Poles Supporting Outdoor Lighting Fixtures: Install grounding electrode and a separate insulated equipment grounding conductor in addition to grounding conductor installed with branch-circuit conductors.

3.4 INSTALLATION

A. Grounding Conductors: Route along shortest and straightest paths possible unless otherwise indicated or required by Code. Avoid obstructing access or placing conductors where they may be subjected to strain, impact, or damage.

B. Ground Bonding Common with Lightning Protection System: Comply with NFPA 780 and UL 96 when interconnecting with lightning protection system. Bond electrical power system ground directly to lightning protection system grounding conductor at closest point to electrical service grounding electrode. Use bonding conductor sized same as system grounding electrode conductor, and install in conduit.

C. Ground Rods: Drive rods until tops are 2 inches below finished floor or final grade unless otherwise indicated.

1. Interconnect ground rods with grounding electrode conductor below grade and as otherwise indicated. Make connections without exposing steel or damaging coating if any.
2. For grounding electrode system, install at **least three** rods spaced at least one-rod length from each other and located at least the same distance from other grounding electrodes, and connect to the service grounding electrode conductor.

D. Test Wells: Ground rod driven through drilled hole in bottom of handhole. Handholes are specified in Division 26 Section "Underground Ducts and Raceways for Electrical Systems," and shall be at least 12 inches deep, with cover.

1. Test Wells: Install at least one test well for each service unless otherwise indicated. Install at the ground rod electrically closest to service entrance. Set top of test well flush with finished grade or floor.

E. Bonding Straps and Jumpers: Install in locations accessible for inspection and maintenance except where routed through short lengths of conduit.

1. Bonding to Structure: Bond straps directly to basic structure, taking care not to penetrate any adjacent parts.
2. Bonding to Equipment Mounted on Vibration Isolation Hangers and Supports: Install bonding so vibration is not transmitted to rigidly mounted equipment.
3. Use exothermic-welded connectors for outdoor locations; if a disconnect-type connection is required, use a bolted clamp.

F. Grounding and Bonding for Piping:

1. Metal Water Service Pipe: Install insulated copper grounding conductors, in conduit, from building's main service equipment, or grounding bus, to main metal water service entrances to building. Connect grounding conductors to main metal water service pipes; use a bolted clamp connector or bolt a lug-type connector to a pipe flange by using one of the lug bolts of the flange. Where a dielectric main water fitting is installed, connect grounding conductor on street side of fitting. Bond metal grounding conductor conduit or sleeve to conductor at each end.
2. Water Meter Piping: Use braided-type bonding jumpers to electrically bypass water meters. Connect to pipe with a bolted connector.
3. Bond each aboveground portion of gas piping system downstream from equipment shutoff valve.

G. Bonding Interior Metal Ducts: Bond metal air ducts to equipment grounding conductors of associated fans, blowers, electric heaters, and air cleaners. Install tinned bonding jumper to bond across flexible duct connections to achieve continuity.

H. Ground Ring: Install a grounding conductor, electrically connected to each building structure ground rod and to each steel column, extending around the perimeter of building.

1. Install tinned-copper conductor not less than No. 2/0 AWG for ground ring and for taps to building steel.
2. Bury ground ring not less than 24 inches from building's foundation.

I. Ufer Ground (Concrete-Encased Grounding Electrode): Fabricate according to NFPA 70; use a minimum **of** 20 feet of bare copper conductor not smaller than No. 4AWG.

1. If concrete foundation is less than 20 feet long, coil excess conductor within base of foundation.
2. Bond grounding conductor to reinforcing steel in at least four locations and to anchor bolts. Extend grounding conductor below grade and connect to building's grounding grid or to grounding electrode external to concrete.

3.5 LABELING

A. Comply with requirements in Division 26 Section "Identification for Electrical Systems" Article for instruction signs. The label or its text shall be green.

B. Install labels at the telecommunications bonding conductor and grounding equalizer

1. Label Text: "If this connector or cable is loose or if it must be removed for any reason, notify the facility manager."

3.6 FIELD QUALITY CONTROL

A. Testing Agency: Engag**e** a qualified testing agency to perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

C. Perform tests and inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

D. Tests and Inspections:

1. After installing grounding system but before permanent electrical circuits have been energized, test for compliance with requirements.
2. Inspect physical and mechanical condition. Verify tightness of accessible, bolted, electrical connections with a calibrated torque wrench according to manufacturer's written instructions.
3. Test completed grounding system at each location where a maximum ground-resistance level is specified, at service disconnect enclosure grounding terminal, at ground test wells[, and at individual ground rods. Make tests at ground rods before any conductors are connected.

a. Measure ground resistance no fewer than two full days after last trace of precipitation and without soil being moistened by any means other than natural drainage or seepage and without chemical treatment or other artificial means of reducing natural ground resistance.
b. Perform tests by fall-of-potential method according to IEEE 81.

4. Prepare dimensioned Drawings locating each test well, ground rod and ground-rod assembly, and other grounding electrodes. Identify each by letter in alphabetical order, and key to the record of tests and observations. Include the number of rods driven and their depth at each location, and include observations of weather and other phenomena that may affect test results. Describe measures taken to improve test results.

E. Grounding system will be considered defective if it does not pass tests and inspections.

F. Prepare test and inspection reports.

G. Report measured ground resistances that exceed the following values:

1. Power and Lighting Equipment or System with Capacity of 500 kVA and Less: 10 ohms.
2. Power and Lighting Equipment or System with Capacity of 500 to 1000 kVA: 5 ohms.
3. Power and Lighting Equipment or System with Capacity More Than 1000 kVA: 3 ohms.
4. Power Distribution Units or Panelboards Serving Electronic Equipment: 3 ohms.
5. Substations and Pad-Mounted Equipment: **5**ohms.
6. Manhole Grounds: 10 ohms.

H. Excessive Ground Resistance: If resistance to ground exceeds specified values, notify Architect promptly and include recommendations to reduce ground resistance.

END OF SECTION 260526

SECTION 26 05 29 - HANGERS AND SUPPORTS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:

1. Hangers and supports for electrical equipment and systems.

B. Construction requirements for concrete bases. Related Sections include the following:

1. Division 26 Section "Vibration And Seismic Controls For Electrical Systems" for products and installation requirements necessary for compliance with seismic criteria.

C. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 DEFINITIONS

A. EMT: Electrical metallic tubing.

B. RMC: Rigid metal conduit.

1.4 PERFORMANCE REQUIREMENTS

A. Delegated Design: Design supports for multiple raceways, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

B. Design supports for multiple raceways capable of supporting combined weight of supported systems and its contents.

C. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.

D. Rated Strength: Adequate in tension, shear, and pullout force to resist maximum loads calculated or imposed for this Project, with a minimum structural safety factor of five times the applied force.

1.5 MRc2: CONSTRUCTION WASTE MANAGEMENT

A. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 018113 Sustainable Design Requirements.

B. EQc4.1: LOW-EMITTING MATERIALS – SEALANTS AND ADHESIVES

All sealants, adhesives, and sealant primers used on the interior of the building shall comply with the project requirements for Low-Emitting Materials – Sealants and Adhesives. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

C. EQc4.2: LOW-EMITTING MATERIALS – PAINTS AND COATINGS

All paints and coatings used in the building interior comply with the project requirements for Low-Emitting Materials – Paints and Coatings. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures

1.6 SUBMITTALS

A. Product Data: For the following:

1. Steel slotted support systems.
2. Nonmetallic slotted support systems.

B. Shop Drawings: Show fabrication and installation details and include calculations for the following:

1. Trapeze hangers. Include Product Data for components.
2. Steel slotted channel systems. Include Product Data for components.
3. Nonmetallic slotted channel systems. Include Product Data for components.
4. Equipment supports.

C. Welding certificates.

1.7 QUALITY ASSURANCE

A. Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

B. Comply with NFPA 70.

1.8 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

B. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 07 Section "Roof Accessories."

PART 2 - PRODUCTS

2.1 SUPPORT, ANCHORAGE, AND ATTACHMENT COMPONENTS

A. Steel Slotted Support Systems: Comply with MFMA-4, factory-fabricated components for field assembly.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Allied Tube & Conduit.
      b. Cooper B-Line, Inc.; a division of Cooper Industries.
      c. ERICO International Corporation.
      d. GS Metals Corp.
      e. Thomas & Betts Corporation.
      f. Unistrut; Tyco International, Ltd.
      g. Wesanco, Inc.
   2. Metallic Coatings: Hot-dip galvanized after fabrication and applied according to MFMA-4.
   3. Nonmetallic Coatings: Manufacturer's standard PVC, polyurethane, or polyester coating applied according to MFMA-4.
   4. Painted Coatings: Manufacturer's standard painted coating applied according to MFMA-4.
   5. Channel Dimensions: Selected for applicable load criteria.

B. Raceway and Cable Supports: As described in NECA 1 and NECA 101.

C. Conduit and Cable Support Devices: Steel hangers, clamps, and associated fittings, designed for types and sizes of raceway or cable to be supported.

D. Support for Conductors in Vertical Conduit: Factory-fabricated assembly consisting of threaded body and insulating wedging plug or plugs for non-armored electrical conductors or cables in riser conduits. Plugs shall have number, size, and shape of conductor gripping pieces as required to suit individual conductors or cables supported. Body shall be malleable iron.

E. Structural Steel for Fabricated Supports and Restraints: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.

F. Mounting, Anchoring, and Attachment Components: Items for fastening electrical items or their supports to building surfaces include the following:
   1. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened portland cement concrete, steel, or wood, with tension, shear, and pullout capacities appropriate for supported loads and building materials where used.

a. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
b. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1) Hilti Inc.
2) ITW Ramset/Red Head; a division of Illinois Tool Works, Inc.
3) MKT Fastening, LLC.
4) Simpson Strong-Tie Co., Inc.; Masterset Fastening Systems Unit.

2. Mechanical-Expansion Anchors: Insert-wedge-type, stainless steel, for use in hardened portland cement concrete with tension, shear, and pullout capacities appropriate for supported loads and building materials in which used.

a. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
b. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1) Cooper B-Line, Inc.; a division of Cooper Industries.
2) Empire Tool and Manufacturing Co., Inc.
3) Hilti Inc.
4) ITW Ramset/Red Head; a division of Illinois Tool Works, Inc.
5) MKT Fastening, LLC.

3. Concrete Inserts: Steel or malleable-iron, slotted support system units similar to MSS Type 18; complying with MFMA-4 or MSS SP-58.
4. Clamps for Attachment to Steel Structural Elements: MSS SP-58, type suitable for attached structural element.
5. Through Bolts: Structural type, hex head, and high strength. Comply with ASTM A 325.
6. Toggle Bolts: All-steel springhead type.
7. Hanger Rods: Threaded steel.

2.2 FABRICATED METAL EQUIPMENT SUPPORT ASSEMBLIES

A. Description: Welded or bolted, structural-steel shapes, shop or field fabricated to fit dimensions of supported equipment.

B. Materials: Comply with requirements in Division 05 Section "Metal Fabrications" for steel shapes and plates.

PART 3 - EXECUTION

3.1 APPLICATION

A. Comply with NECA 1 and NECA 101 for application of hangers and supports for electrical equipment and systems except if requirements in this Section are stricter.

B. Maximum Support Spacing and Minimum Hanger Rod Size for Raceway: Space supports for EMT, IMC, and RMC as required by NFPA 70. Minimum rod size shall be 1/4 inch in diameter.

C. Multiple Raceways or Cables: Install trapeze-type supports fabricated with steel slotted support system, sized so capacity can be increased by at least 25 percent in future without exceeding specified design load limits.

D. Spring-steel clamps designed for supporting single conduits without bolts may be used for 1-1/2-inch and smaller raceways serving branch circuits and communication systems above suspended ceilings and for fastening raceways to trapeze supports.

3.2 SUPPORT INSTALLATION

A. Comply with NECA 1 and NECA 101 for installation requirements except as specified in this Article.

B. Raceway Support Methods: In addition to methods described in NECA 1, [EMT, IMC, and RMC may be supported by openings through structure members, as permitted in NFPA 70.

C. Strength of Support Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 lb .

D. Mounting and Anchorage of Surface-Mounted Equipment and Components: Anchor and fasten electrical items and their supports to building structural elements by the following methods unless otherwise indicated by code:

1. To New Concrete: Bolt to concrete inserts.
2. To Masonry: Approved toggle-type bolts on hollow masonry units and expansion anchor fasteners on solid masonry units.
3. To Existing Concrete: Expansion anchor fasteners.
4. Instead of expansion anchors, powder-actuated driven threaded studs provided with lock washers and nuts may be used in existing standard-weight concrete 4 inches thick or greater. Do not use for anchorage to lightweight-aggregate concrete or for slabs less than 4 inches thick.
5. To Steel: Beam clamps MSS Type 19, 21, 23, 25, or 27 complying with MSS SP-69.
6. To Light Steel: Sheet metal screws.
7. Items Mounted on Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices on slotted-channel racks attached to substrate.
8. Drill holes for exp Items Mounted on Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices on slotted-channel racks attached to substrate by means that meet seismic-restraint strength and anchorage requirements.

E. Expansion anchors in concrete at locations and to depths that avoid reinforcing bars.

3.3 INSTALLATION OF FABRICATED METAL SUPPORTS

A. Comply with installation requirements in Division 05 Section "Metal Fabrications" for site-fabricated metal supports.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.

C. Field Welding: Comply with AWS D1.1/D1.1M.

3.4 CONCRETE BASES

A. Construct concrete bases of dimensions indicated but not less than 4 inches larger in both directions than supported unit, and so anchors will be a minimum of 10 bolt diameters from edge of the base.

B. Use 3000-psi, 28-day compressive-strength concrete. Concrete materials, reinforcement, and placement requirements are specified in Division 03 Section Cast-in-Place Concrete.

C. Anchor equipment to concrete base.

1. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
2. Install anchor bolts to elevations required for proper attachment to supported equipment.
3. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

3.5 PAINTING

A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.

1. Apply paint by brush or spray to provide minimum dry film thickness of 2.0.

B. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

END OF SECTION 260529

SECTION 26 05 33 - RACEWAY AND BOXES FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes raceways, fittings, boxes, enclosures, and cabinets for electrical wiring.

B. Related Sections include the following:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.

2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

3. Division 26 Section "Underground Ducts and Raceways for Electrical Systems" for exterior ductbanks, manholes, and underground utility construction

1.3 DEFINITIONS

A. EMT: Electrical metallic tubing.

B. RGS: Rigid metal conduit.

C. EPDM: Ethylene-propylene-diene terpolymer rubber.

D. FMC: Flexible metal conduit.

E. IMC: Intermediate metal conduit.

F. LFMC: Liquidtight flexible metal conduit.

G. LFNC: Liquidtight flexible nonmetallic conduit.

H. NBR: Acrylonitrile-butadiene rubber.

I. RNC: Rigid nonmetallic conduit.

1.4 MRc2: CONSTRUCTION WASTE MANAGEMENT

A. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 018113 Sustainable Design Requirements.

B. EQc4.1: LOW-EMITTING MATERIALS – SEALANTS AND ADHESIVES

All sealants, adhesives, and sealant primers used on the interior of the building shall comply with the project requirements for Low-Emitting Materials – Sealants and Adhesives. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

C. EQc4.2: LOW-EMITTING MATERIALS – PAINTS AND COATINGS

All paints and coatings used in the building interior comply with the project requirements for Low-Emitting Materials – Paints and Coatings. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

1.5 SUBMITTALS

A. Product Data: For surface raceways, wireways and fittings, floor boxes, hinged-cover enclosures, and cabinets.

B. Shop Drawings: For the following raceway components. Include plans, elevations, sections, details, and attachments to other work.

1. Custom enclosures and cabinets.
2. For handholes and boxes for underground wiring, including the following:

    a. Duct entry provisions, including locations and duct sizes.
    b. Frame and cover design.
    c. Grounding details.
    d. Dimensioned locations of cable rack inserts, and pulling-in and lifting irons.
    e. Joint details.

C. Samples for Initial Selection**:** For wireways, surface raceways with factory-applied texture and color finishes.

D. Coordination Drawings: Conduit routing plans, drawn to scale, on which the following items are shown and coordinated with each other, based on input from installers of the items involved:

1. Structural members in the paths of conduit groups with common supports.
2. HVAC and plumbing items and architectural features in the paths of conduit groups with common supports.

E. Qualification Data: For professional engineer and testing agency.

F. Manufacturer Seismic Qualification Certification: Submit certification that enclosures and cabinets and their mounting provisions, including those for internal components, will withstand seismic forces defined in Division 26 Section "Vibration and Seismic Controls for Electrical Systems." Include the following:

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

a. The term "withstand" means "the cabinet or enclosure will remain in place without separation of any parts when subjected to the seismic forces specified.

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

G. Source quality-control test reports.

1.6 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.7 Comply with NFPA 70. WARRANTY

A. Warranty Period: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 METAL CONDUIT AND TUBING

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. AFC Cable Systems, Inc.
2. Alflex Inc.
3. Allied Tube & Conduit; a Tyco International Ltd. Co.
4. Anamet Electrical, Inc.; Anaconda Metal Hose.
5. Electri-Flex Co.
6. Manhattan/CDT/Cole-Flex.
7. Maverick Tube Corporation.
8. O-Z Gedney; a unit of General Signal.
9. Wheatland Tube Company.

B. Rigid Steel Conduit: ANSI C80.1.

C. IMC: ANSI C80.6.

D. PVC-Coated Steel Conduit: PVC-coated rigid steel conduit..

1. Comply with NEMA RN 1.
2. Coating Thickness: 0.040 inch) minimum.

E. EMT: ANSI C80.3.

F. FMC: Zinc-coated steel.

G. LFMC: Flexible steel conduit with PVC jacket.

H. Fittings for Conduit (Including all Types and Flexible and Liquidtight), EMT, and Cable: NEMA FB 1; listed for type and size raceway with which used, and for application and environment in which installed.

1. Conduit Fittings for Hazardous (Classified) Locations: Comply with UL 886.
2. Fittings for EMT: Steel, compression type.
3. Coating for Fittings for PVC-Coated Conduit: Minimum thickness, 0.040 inch with overlapping sleeves protecting threaded joints.

I. Joint Compound for Rigid Steel Conduit or IMC: Listed for use in cable connector assemblies, and compounded for use to lubricate and protect threaded raceway joints from corrosion and enhance their conductivity.

2.2 NONMETALLIC CONDUIT

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. AFC Cable Systems, Inc.
2. Anamet Electrical, Inc.; Anaconda Metal Hose.
3. Arnco Corporation.
4. CANTEX Inc.
5. CertainTeed Corp.; Pipe & Plastics Group.
6. Condux International, Inc.
7. ElecSYS, Inc.
8. Electri-Flex Co.
9. Lamson & Sessions; Carlon Electrical Products.
10. Manhattan/CDT/Cole-Flex.
11. RACO; a Hubbell Company.
12. Thomas & Betts Corporation.

B. RNC: NEMA TC 2, Type EPC-40-PVC**,** unless otherwise indicated.

C. LFNC: UL 1660.

D. Fittings for ENT and RNC: NEMA TC 3; match to conduit or tubing type and material.

E. Fittings for LFNC: UL 514B.

2.3 METAL WIREWAYS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Cooper B-Line, Inc.
2. Hoffman.
3. Square D; Schneider Electric.

C. Description: Sheet metal sized and shaped as indicated, NEMA 250, Type 1, unless otherwise indicated.

D. Fittings and Accessories: Include couplings, offsets, elbows, expansion joints, adapters, hold-down straps, end caps, and other fittings to match and mate with wireways as required for complete system.

E. Finish: Manufacturer's standard enamel finish.

2.4 SURFACE RACEWAYS

A. Surface Metal Raceways: Galvanized steel with snap-on covers. Manufacturer's standard enamel finish in color selected by Architect.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Thomas & Betts Corporation.
b. Walker Systems, Inc.; Wiremold Company (The).
c. Wiremold Company (The); Electrical Sales Division.

2.5 BOXES, ENCLOSURES, AND CABINETS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Cooper Crouse-Hinds; Div. of Cooper Industries, Inc.
2. EGS/Appleton Electric.
3. Erickson Electrical Equipment Company.
4. Hoffman.
5. Hubbell Incorporated; Killark Electric Manufacturing Co. Division.
6. O-Z/Gedney; a unit of General Signal.
7. RACO; a Hubbell Company.
8. Robroy Industries, Inc.; Enclosure Division.
9. Scott Fetzer Co.; Adalet Division.
10. Spring City Electrical Manufacturing Company.
11. Thomas & Betts Corporation.
12. Walker Systems, Inc.; Wiremold Company (The).
13. Woodhead, Daniel Company; Woodhead Industries, Inc. Subsidiary.

B. Sheet Metal Outlet and Device Boxes: NEMA OS 1.

C. Cast-Metal Outlet and Device Boxes: NEMA FB 1**,** aluminum, Type FD, with gasketed cover.

D. Metal Floor Boxes: Cast or sheet metal, rectangular.

E. Nonmetallic Floor Boxes: Nonadjustable, round.

F. Small Sheet Metal Pull and Junction Boxes: NEMA OS 1.

G. Cast-Metal Access, Pull, and Junction Boxes: NEMA FB 1, with gasketed cover.

H. Hinged-Cover Enclosures: NEMA 250, Type 1, with continuous-hinge cover with flush latch, unless otherwise indicated.

1. Metal Enclosures: Steel, finished inside and out with manufacturer's standard enamel.

I. Cabinets:

1. NEMA 250, Type 1, galvanized-steel box with removable interior panel and removable front, finished inside and out with manufacturer's standard enamel.
2. Hinged door in front cover with flush latch and concealed hinge.
3. Key latch to match panelboards.
4. Metal barriers to separate wiring of different systems and voltage.
5. Accessory feet where required for freestanding equipment.

2.6 SLEEVES FOR RACEWAYS

A. Steel Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, galvanized steel, plain ends.

B. Cast-Iron Pipe Sleeves: Cast or fabricated "wall pipe," equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.

C. Sleeves for Rectangular Openings: Galvanized sheet steel with minimum 0.052- or 0.138-inch thickness as indicated and of length to suit application.

D. Coordinate sleeve selection and application with selection and application of firestopping specified in Division 07 Section "Penetration Firestopping."

2.7 SLEEVE SEALS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

B. Basis-of-Design Product: Subject to compliance with requirements, provide a comparable product by one of the following:

1. Advance Products & Systems, Inc.
2. Calpico, Inc.

3. Metraflex Co.
4. Pipeline Seal and Insulator, Inc.

C. Description: Modular sealing device, designed for field assembly, to fill annular space between sleeve and cable.

1. Sealing Elements: EPDM, NBR interlocking links shaped to fit surface of cable or conduit. Include type and number required for material and size of raceway or cable.
2. Pressure Plates: Stainless steel. Include two for each sealing element.
3. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements. Include one for each sealing element.

2.8 SOURCE QUALITY CONTROL FOR UNDERGROUND ENCLOSURES

A. Handhole and Pull-Box Prototype Test: Test prototypes of handholes and boxes for compliance with SCTE 77. Strength tests shall be for specified tier ratings of products supplied.

1. Tests of materials shall be performed by a independent testing agency.
2. Strength tests of complete boxes and covers shall be by either an independent testing agency or manufacturer. A qualified registered professional engineer shall certify tests by manufacturer.
3. Testing machine pressure gages shall have current calibration certification complying with ISO 9000 and ISO 10012, and traceable to NIST standards.

PART 3 - EXECUTION

3.1 RACEWAY APPLICATION

A. Outdoors: Apply raceway products as specified below, unless otherwise indicated:

1. Exposed Conduit: Rigid steel conduit.
2. Concealed Conduit, Aboveground: RNC, Type EPC-40-PVC.
3. Underground Conduit: RNC, Type EPC-40 PVC, direct buried.
4. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): LFMC**.**
5. Boxes and Enclosures, Aboveground: NEMA 250, Type 4X.

B. Comply with the following indoor applications, unless otherwise indicated:

1. Exposed, Not Subject to Physical Damage: EMT, Rigid steel conduit areas access to inmates conduit below 11’ aff and garage area.
2. Exposed and Subject to Severe Physical Damage: Rigid steel conduit. Includes raceways in the following locations:

    a. Loading dock.
    b. Corridors used for traffic of mechanized carts, forklifts, and pallet-handling units.
    c. Mechanical rooms.
    d. Areas access to inmates below 11’ aff.

e. Garage

3. Concealed in Ceilings and Interior Walls and Partitions: EMT.
4. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): FMC, except use LFMC in damp or wet locations.
5. Damp or Wet Locations: Rigid steel conduit
6. Boxes and Enclosures: NEMA 250, Type 1, except use NEMA 250, Type 4, stainless steel in damp or wet locations.

C. Minimum Raceway Size: 3/4-inch trade size.

D. Raceway Fittings: Compatible with raceways and suitable for use and location.

1. Rigid and Intermediate Steel Conduit: Use threaded rigid steel conduit fittings, unless otherwise indicated.
2. PVC Externally Coated, Rigid Steel Conduits: Use only fittings listed for use with that material. Patch and seal all joints, nicks, and scrapes in PVC coating after installing conduits and fittings. Use sealant recommended by fitting manufacturer.

3.2 INSTALLATION

A. Comply with NECA 1 for installation requirements applicable to products specified in Part 2 except where requirements on Drawings or in this Article are stricter.

B. Keep raceways at least 6 inches)away from parallel runs of flues and steam or hot-water pipes. Install horizontal raceway runs above water and steam piping.

C. Complete raceway installation before starting conductor installation.

D. Support raceways as specified in Division 26 Section "Hangers and Supports for Electrical Systems."

E. Arrange stub-ups so curved portions of bends are not visible above the finished slab.

F. Install no more than the equivalent of teo 90-degree bends in any conduit run for communications conduits.

G. Conceal conduit and EMT within finished walls, ceilings, and floors, unless otherwise indicated.

H. Raceways Embedded in Slabs:

1. Run conduit larger than 1-inch trade size, parallel or at right angles to main reinforcement. Where at right angles to reinforcement, place conduit close to slab support.
2. Arrange raceways to cross building expansion joints at right angles with expansion fittings.
3. Change from ENT to RNC, Type EPC-40-PVC, rigid steel conduit, or IMC before rising above the floor.

I. Threaded Conduit Joints, Exposed to Wet, Damp, Corrosive, or Outdoor Conditions: Apply listed compound to threads of raceway and fittings before making up joints. Follow compound manufacturer's written instructions.

J. Raceway Terminations at Locations Subject to Moisture or Vibration: Use insulating bushings to protect conductors, including conductors smaller than No. 4 AWG.

K. Install pull wires in empty raceways. Use polypropylene or monofilament plastic line with not less than 200-lb tensile strength. Leave at least 12 inches of slack at each end of pull wire.

L. Raceways for Optical Fiber and Communications Cable: Install raceways, metallic and nonmetallic, rigid and flexible, as follows:

1. 3/4-Inch Trade Size and Smaller: Install raceways in maximum lengths of 50 feet'.
2. 1-Inch Trade Size and Larger: Install raceways in maximum lengths of 75 feet .
3. Install with a maximum of two 90-degree bends or equivalent for each length of raceway unless Drawings show stricter requirements. Separate lengths with pull or junction boxes or terminations at distribution frames or cabinets where necessary to comply with these requirements.

M. Install raceway sealing fittings at suitable, approved, and accessible locations and fill them with listed sealing compound. For concealed raceways, install each fitting in a flush steel box with a blank cover plate having a finish similar to that of adjacent plates or surfaces. Install raceway sealing fittings at the following points:

1. Where conduits pass from warm to cold locations, such as boundaries of refrigerated spaces.
2. Where otherwise required by NFPA 70.

N. Expansion-Joint Fittings for RNC: Install in each run of aboveground conduit that is located where environmental temperature change may exceed 30 deg F and that has straight-run length that exceeds 25 feet .

1. Install expansion-joint fittings for each of the following locations, and provide type and quantity of fittings that accommodate temperature change listed for location:

   a. Outdoor Locations Not Exposed to Direct Sunlight: 125 deg temperature change.
2. Install each expansion-joint fitting with position, mounting, and piston setting selected according to manufacturer's written instructions for conditions at specific location at the time of installation.

O. Flexible Conduit Connections: Use maximum of 72 inches of flexible conduit for recessed and semi-recessed lighting fixtures for areas not accessible to inmates**,** equipment subject to vibration, noise transmission, or movement; and for transformers and motors.

1. Use LFMC in damp or wet locations subject to severe physical damage.

P. Recessed Boxes in Masonry Walls: Saw-cut opening for box in center of cell of masonry block, and install box flush with surface of wall.

Q. Set metal floor boxes level and flush with finished floor surface.

3.3 INSTALLATION OF UNDERGROUND CONDUIT

A. Direct-Buried Conduit:

1. Excavate trench bottom to provide firm and uniform support for conduit. Prepare trench bottom as specified in Division 31 Section "Earth Moving" for pipe less than 6 inches in nominal diameter.
2. Install backfill as specified in Division 31 Section "Earth Moving."
3. After installing conduit, backfill and compact. Start at tie-in point, and work toward end of conduit run, leaving conduit at end of run free to move with expansion and contraction as temperature changes during this process. Firmly hand tamp backfill around conduit to provide maximum supporting strength. After placing controlled backfill to within 12 inches of finished grade, make final conduit connection at end of run and complete backfilling with normal compaction as specified in Division 31 Section "Earth Moving."
4. Install manufactured rigid steel conduit elbows for stub-ups at poles and equipment and at building entrances through the floor.

    a. Couple steel conduits to ducts with adapters designed for this purpose, and encase coupling with 3 inches of concrete.
    b. For stub-ups at equipment mounted on outdoor concrete bases, extend steel conduit horizontally a minimum of 60 inches from edge of equipment pad or foundation. Install insulated grounding bushings on terminations at equipment.

5. Warning Planks: Bury warning planks approximately 12 inches above direct-buried conduits, placing them 24 inches o.c. Align planks along the width and along the centerline of conduit.

3.4 SLEEVE INSTALLATION FOR ELECTRICAL PENETRATIONS

A. Coordinate sleeve selection and application with selection and application of firestopping specified in Division 07 Section "Penetration Firestopping."

B. Concrete Slabs and Walls: Install sleeves for penetrations unless core-drilled holes or formed openings are used. Install sleeves during erection of slabs and walls.

C. Use pipe sleeves unless penetration arrangement requires rectangular sleeved opening.

D. Rectangular Sleeve Minimum Metal Thickness:

1. For sleeve cross-section rectangle perimeter less than 50 inches and no side greater than 16 inches , thickness shall be 0.052 inch

E. Fire-Rated Assemblies: Install sleeves for penetrations of fire-rated floor and wall assemblies unless openings compatible with firestop system used are fabricated during construction of floor or wall.

F. Extend sleeves installed in floors 2 inches above finished floor level.

G. Seal space outside of sleeves with grout for penetrations of concrete and masonry and with approved joint compound for gypsum board assemblies.

H. Interior Penetrations of Non-Fire-Rated Walls and Floors: Seal annular space between sleeve and raceway, using joint sealant appropriate for size, depth, and location of joint. Refer to Division 07 Section "Joint Sealants" for materials and installation.

I. Fire-Rated-Assembly Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at raceway penetrations. Install sleeves and seal with firestop materials. Comply with Division 07 Section "Penetration Firestopping."

J. Roof-Penetration Sleeves: Seal penetration of individual raceways with flexible, boot-type flashing units applied in coordination with roofing work.

K. Aboveground, Exterior-Wall Penetrations: Seal penetrations using sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

L. Underground, Exterior-Wall Penetrations: Install cast-iron "wall pipes" for sleeves. Size sleeves to allow for 1-inch annular clear space between raceway and sleeve for installing mechanical sleeve seals.

3.5 SLEEVE-SEAL INSTALLATION

A. Install to seal underground, exterior wall penetrations.

B. Use type and number of sealing elements recommended by manufacturer for raceway material and size. Position raceway in center of sleeve. Assemble mechanical sleeve seals and install in annular space between raceway and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

3.6 FIRESTOPPING

A. Apply firestopping to electrical penetrations of fire-rated floor and wall assemblies to restore original fire-resistance rating of assembly. Firestopping materials and installation requirements are specified in Division 07 Section "Penetration Firestopping."

3.7 PROTECTION

A. Provide final protection and maintain conditions that ensure coatings, finishes, and cabinets are without damage or deterioration at time of Substantial Completion.

1. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.
2. Repair damage to PVC or paint finishes with matching touchup coating recommended by manufacturer.

END OF SECTION 260533

SECTION 26 05 36 - CABLE TRAYS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Ladder cable trays.
2. Wire-basket cable trays.

B. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of cable tray.

1. Include data indicating dimensions and finishes for each type of cable tray indicated.

B. Shop Drawings: For each type of cable tray.

1. Show fabrication and installation details of cable trays, including plans, elevations, and sections of components and attachments to other construction elements. Designate components and accessories, including clamps, brackets, hanger rods, splice-plate connectors, expansion-joint assemblies, straight lengths, and fittings.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Floor plans and sections, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Include scaled cable tray layout and relationships between components and adjacent structural, electrical, and mechanical elements.
2. Vertical and horizontal offsets and transitions.
3. Clearances for access above and to side of cable trays.
4. Vertical elevation of cable trays above the floor or below bottom of ceiling structure.

B. Seismic Qualification Certificates: For cable trays, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Field quality-control reports.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 014000 "Quality Requirements," to design cable tray supports and seismic bracing.

2.2 GENERAL REQUIREMENTS FOR CABLE TRAYS

A. Cable Trays and Accessories: Identified as defined in NFPA 70 and marked for intended location, application, and grounding.

1. Source Limitations: Obtain cable trays and components from single manufacturer.

B. Sizes and Configurations: See the Cable Tray Schedule on Drawings for specific requirements for types, materials, sizes, and configurations.

C. Structural Performance: See articles for individual cable tray types for specific values for the following parameters:

1. Uniform Load Distribution: Capable of supporting a uniformly distributed load on the indicated support span when supported as a simple span and tested according to NEMA VE 1.
2. Concentrated Load: A load applied at midpoint of span and centerline of tray.
3. Load and Safety Factors: Applicable to both side rails and rung capacities.

2.3 LADDER CABLE TRAYS

A. Description:

1. Configuration: Two I-beam side rails with transverse rungs welded to side rails.
2. Rung Spacing: **12 inches** o.c.
3. Radius-Fitting Rung Spacing: 9 inches at center of tray's width.
4. Minimum Cable-Bearing Surface for Rungs: 7/8-inch width with radius edges.
5. No portion of the rungs shall protrude below the bottom plane of side rails.
6. Structural Performance of Each Rung: Capable of supporting a maximum cable load, with a safety factor of 1.5, plus a 200-lb concentrated load, when tested according to NEMA VE 1.

7. Minimum Usable Load Depth: **4 inches.**
8. Straight Section Lengths: **10 feet** except where shorter lengths are required to facilitate tray assembly.
9. Width: **12** unless otherwise indicated on Drawings.
10. Fitting Minimum Radius: **24 inches.**
11. Splicing Assemblies: Bolted type using serrated flange locknuts.
12. Hardware and Fasteners: **ASTM F 593 and ASTM F 594 stainless steel, Type 316.**
13. Splice Plate Capacity: Splices located within support span shall not diminish rated loading capacity of cable tray.

2.4 WIRE-BASKET

A. Description:

1. Configuration: Wires are formed into a standard 2-by-4-inch wire mesh pattern with intersecting wires welded together. Mesh sections must have at least one bottom longitudinal wire along entire length of section.
2. Materials: High-strength-steel longitudinal wires with no bends.
3. Safety Provisions: Wire ends along wire-basket sides (flanges) rounded during manufacturing to maintain integrity of cables and installer safety.

4. Connector Assemblies: Bolt welded to plate shaped to fit around adjoining tray wires and mating plate. Mechanically joins adjacent tray wires to splice sections together or to create horizontal fittings.
5. Connector Assembly Capacity: Splices located within support span shall not diminish rated loading capacity of cable tray.
6. Hardware and Fasteners: **ASTM F 593 and ASTM F 594 stainless steel, Type 316** .

2.5 MATERIALS AND FINISHES

A. Steel:

1. Straight Section and Fitting Side Rails and Rungs: Steel complies with the minimum mechanical properties of **ASTM A 1011/A 1011M, SS, Grade 33**.
2. Steel Tray Splice Plates: ASTM A 1011/A 1011M, HSLAS, Grade 50, Class 1.
3. Fasteners: Steel complies with the minimum mechanical properties of ASTM A 510/A 510M, Grade 1008.
4. Finish: Mill galvanized before fabrication.

   a. Standard: Comply with ASTM A 653/A 653M, G90.
   b. Hardware: **Galvanized, ASTM B 633**.

2.6 CABLE TRAY ACCESSORIES

A. Fittings: Tees, crosses, risers, elbows, and other fittings as indicated, of same materials and finishes as cable tray.

B. Barrier Strips: Same materials and finishes as for cable tray.

C. Cable tray supports and connectors, including bonding jumpers, as recommended by cable tray manufacturer.

2.7 SOURCE QUALITY CONTROL

A. Testing: Test and inspect cable trays according to **NEMA FG 1**.

PART 3 - EXECUTION

3.1 CABLE TRAY INSTALLATION

A. Install cable trays according to **NEMA FG 1**.

B. Install ladder cable trays inside IDF and MDF rooms and wire basket in hallways.

C. Install cable trays as a complete system, including fasteners, hold-down clips, support systems, barrier strips, adjustable horizontal and vertical splice plates, elbows, reducers, tees, crosses, cable dropouts, adapters, covers, and bonding.

D. Install cable trays so that the tray is accessible for cable installation and all splices are accessible for inspection and adjustment.

E. Remove burrs and sharp edges from cable trays.

F. Join aluminum cable tray with splice plates; use four square neck-carriage bolts and locknuts.

G. Fasten cable tray supports to building structure.

H. Design fasteners and supports to carry cable tray, the cables, and a concentrated load of 200 lb. Comply with requirements in Section 260529 "Hangers and Supports for Electrical Systems.

I. Place supports so that spans do not exceed maximum spans on schedules and provide clearances shown on Drawings. Install intermediate supports when cable weight exceeds the load-carrying capacity of the tray rungs.

J. Construct supports from channel members, threaded rods, and other appurtenances furnished by cable tray manufacturer. Arrange supports in trapeze or wall-bracket form as required by application.

K. Support bus assembly to prevent twisting from eccentric loading.

L. Install center-hung supports for single-rail trays designed for 60 versus 40 percent eccentric loading condition, with a safety factor of 3.

M. Locate and install supports according to **NEMA FG 1**. Do not install more than one cable tray splice between supports.

N. Support wire-basket cable trays with **center support hangers** or **trapeze hangers.**.

O. Support wire-basket trays with **3/8-inch-**diameter rods.

P. Make connections to equipment with flanged fittings fastened to cable trays and to equipment. Support cable trays independent of fittings. Do not carry weight of cable trays on equipment enclosure.

Q. Install expansion connectors where cable trays cross building expansion joints and in cable tray runs that exceed dimensions recommended in **NEMA FG 1.** Space connectors and set gaps according to applicable standard.

R. Make changes in direction and elevation using manufacturer's recommended fittings.

S. Make cable tray connections using manufacturer's recommended fittings.

T. Seal penetrations through fire and smoke barriers. Comply with requirements in Section 078413 "Penetration Firestopping."

U. Install capped metal sleeves for future cables through firestop-sealed cable tray penetrations of fire and smoke barriers.

V. Install cable trays with enough workspace to permit access for installing cables.

W. Install barriers to separate cables of different systems, such as power, communications, and data processing; or of different insulation levels, such as 600, 5000, and 15 000 V.

X. Install permanent covers, if used, after installing cable. Install cover clamps according to NEMA VE 2.

Y. Clamp covers on cable trays installed outdoors with heavy-duty clamps.

Z. Install warning signs in visible locations on or near cable trays after cable tray installation.

3.2 CABLE TRAY GROUNDING

A. Ground cable trays according to NFPA 70 unless additional grounding is specified. Comply with requirements in Section 270526 "Grounding and Bonding for Communications Systems."

B. Cable trays with communications cable shall be bonded together with splice plates listed for grounding purposes or with listed bonding jumpers.

C. Cable trays with control conductors shall be bonded together with splice plates listed for grounding purposes or with listed bonding jumpers.

D. When using epoxy- or powder-coat painted cable trays as a grounding conductor, completely remove coating at all splice contact points or ground connector attachment. After completing splice-to-grounding bolt attachment, repair the coated surfaces with coating materials recommended by cable tray manufacturer.

E. Bond cable trays to power source for cables contained within with bonding conductors sized according to NFPA 70, Article 250.122, "Size of Equipment Grounding Conductors."

3.3 CABLE INSTALLATION

A. Install cables only when each cable tray run has been completed and inspected.

B. Fasten cables on horizontal runs with cable clamps or cable ties according to NEMA VE 2. Tighten clamps only enough to secure the cable, without indenting the cable jacket. Install cable ties with a tool that includes an automatic pressure-limiting device.

C. Fasten cables on vertical runs to cable trays every 18 inches.

D. Fasten and support cables that pass from one cable tray to another or drop from cable trays to equipment enclosures. Fasten cables to the cable tray at the point of exit and support cables independent of the enclosure. The cable length between cable trays or between cable tray and enclosure shall be no more than 72 inches.

E. In existing construction, remove inactive or dead cables from cable trays.

3.4 CONNECTIONS

A. Remove paint from all connection points before making connections. Repair paint after the connections are completed.

B. Connect pathways to cable trays according to requirements in NEMA VE 2 and NEMA FG 1.

3.5 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:

1. After installing cable trays and after electrical circuitry has been energized, survey for compliance with requirements.
2. Visually inspect cable insulation for damage. Correct sharp corners, protuberances in cable trays, vibrations, and thermal expansion and contraction conditions, which may cause or have caused damage.
3. Verify that the number, size, and voltage of cables in cable trays do not exceed that permitted by NFPA 70. Verify that communications or data-processing circuits are separated from power circuits by barriers or are installed in separate cable trays.
4. Verify that there are no intruding items such as pipes, hangers, or other equipment in the cable tray.
5. Remove dust deposits, industrial process materials, trash of any description, and any blockage of tray ventilation.
6. Visually inspect each cable tray joint and each ground connection for mechanical continuity. Check bolted connections between sections for corrosion. Clean and retorque in suspect areas.
7. Check for improperly sized or installed bonding jumpers.
8. Check for missing, incorrect, or damaged bolts, bolt heads, or nuts. When found, replace with specified hardware.
9. Perform visual and mechanical checks for adequacy of cable tray grounding; verify that all takeoff raceways are bonded to cable trays. Test entire cable tray system for continuity. Maximum allowable resistance is 1 ohm.

B. Prepare test and inspection reports.

3.6 PROTECTION

A. Protect installed cable trays and cables.

1. Install temporary protection for cables in open trays to safeguard exposed cables against falling objects or debris during construction. Temporary protection for cables and cable

tray can be constructed of wood or metal materials and shall remain in place until the risk of damage is over.

2. Repair damage to galvanized finishes with zinc-rich paint recommended by cable tray manufacturer.
3. Repair damage to paint finishes with matching touchup coating recommended by cable tray manufacturer.

END OF SECTION 270536

SECTION 26 05 43 - UNDERGROUND DUCTS AND RACEWAYS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:

1. Conduit, ducts, and duct accessories for concrete-encased duct banks, and in single duct runs.

B. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 DEFINITION

A. RNC: Rigid nonmetallic conduit.

1.4 MRc2: Construction Waste Management

A. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 018113 Sustainable Design Requirements.

B. EQc4.1: LOW-EMITTING MATERIALS – SEALANTS AND ADHESIVES

All sealants, adhesives, and sealant primers used on the interior of the building shall comply with the project requirements for Low-Emitting Materials – Sealants and Adhesives. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

C. EQc4.2: LOW-EMITTING MATERIALS – PAINTS AND COATINGS

All paints and coatings used in the building interior comply with the project requirements for Low-Emitting Materials – Paints and Coatings. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

1.5 SUBMITTALS

A. Product Data: For the following:

1. Duct-bank materials, including separators and miscellaneous components.
2. Ducts and conduits and their accessories, including elbows, end bells, bends, fittings, and solvent cement.

B. Shop Drawings for Pre-cast or Factory-Fabricated Underground Utility Structures: Include plans, elevations, sections, details, attachments to other work, and accessories, including the following:

1. Duct entry provisions, including locations and duct sizes.
2. Reinforcement details.

C. Duct-Bank Coordination Drawings: Show duct profiles and coordination with other utilities and underground structures.

1. Include plans and sections, drawn to scale, and show bends and locations of expansion fittings.

D. Product Certificates: For concrete and steel used in pre-cast concrete manholes and handholes, as required by ASTM C 858.

E. Source quality-control test reports.

F. Field quality-control test reports.

1.6 QUALITY ASSURANCE

A. Testing Agency Qualifications: Qualified according to ASTM E 329 for testing indicated

B. Comply with ANSI C2.

C. Comply with NFPA 70.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver ducts to Project site with ends capped. Store nonmetallic ducts with supports to prevent bending, warping, and deforming.

B. Store pre-cast concrete underground utility structures at Project site as recommended by manufacturer to prevent physical damage. Arrange so identification markings are visible.

C. Lift and support pre-cast concrete units only at designated lifting or supporting points.

1.8 COORDINATION

A. Coordinate layout and installation of ducts and boxes with final arrangement of other utilities, site grading, and surface features as determined in the field.

B. Coordinate elevations of ducts and duct-bank entrances into boxes with final locations and profiles of ducts and duct banks as determined by coordination with other utilities, underground obstructions, and surface features. Revise locations and elevations from those indicated as required to suit field conditions.

PART 2 - PRODUCTS

2.2 DUCTS

A. RNC: NEMA TC 2, Type EPC-40-PVC and Type EPC-80-PVC, UL 651, with matching fittings by same manufacturer as the conduit, complying with NEMA TC 3 and UL 514B.

2.3 NONMETALLIC DUCT ACCESSORIES

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. ARNCO Corp.
2. Lamson & Sessions; Carlon Electrical Products.
3. Spiraduct/AFC Cable Systems, Inc.
4. Or Approved Equal

B. Duct Accessories:

1. Duct Separators: Factory-fabricated rigid PVC interlocking spacers, sized for type and sizes of ducts with which used, and selected to provide minimum duct spacings indicated while supporting ducts during concreting or backfilling.
2. Warning Tape: Underground-line warning tape specified in Division 26 Section "Identification for Electrical Systems."

2.4 SOURCE QUALITY CONTROL

A. Test and inspect pre-cast concrete utility structures according to ASTM C 1037.

PART 3 - EXECUTION

3.2 UNDERGROUND ENCLOSURE APPLICATION

3.3 EARTHWORK

A. Excavation and Backfill: Do not use heavy-duty, hydraulic-operated, compaction equipment.

B. Restore surface features at areas disturbed by excavation and reestablish original grades, unless otherwise indicated. Replace removed sod immediately after backfilling is completed.

C. Restore areas disturbed by trenching, storing of dirt, cable laying, and other work. Restore vegetation and include necessary topsoiling, fertilizing, liming, seeding, sodding, sprigging, and mulching.

D. Cut and patch existing pavement in the path of underground ducts and utility structures.

3.4 DUCT INSTALLATION

A. Joints: Use solvent-cemented joints in ducts and fittings and make watertight according to manufacturer's written instructions. Stagger couplings so those of adjacent ducts do not lie in same plane.

B. Sealing: Provide temporary closure at terminations of ducts that have cables pulled. Seal spare ducts at terminations. Use sealing compound and plugs to withstand at least 15-psig hydrostatic pressure.

C. Pulling Cord: Install 200-lbf- test nylon cord in ducts, including spares.

D. Concrete-Encased Ducts: Support ducts on duct separators.

1. Separator Installation: Space separators close enough to prevent sagging and deforming of ducts, with not less than 5 spacers per 20 feet of duct. Secure separators to earth and to ducts to prevent floating during concreting. Stagger separators approximately 6 inches between tiers. Tie entire assembly together using fabric straps; do not use tie wires or reinforcing steel that may form conductive or magnetic loops around ducts or duct groups.
2. Concreting Sequence: Pour each run of envelope between manholes or other terminations in one continuous operation.

B. Start at one end and finish at the other, allowing for expansion and contraction of ducts as their temperature changes during and after the pour. Use expansion fittings installed according to manufacturer's written recommendations, or use other specific measures to prevent expansion-contraction damage.

C. If more than one pour is necessary, terminate each pour in a vertical plane and install 3/4-inch reinforcing rod dowels extending 18 inches into concrete on both sides of joint near corners of envelope.

3. Pouring Concrete: Spade concrete carefully during pours to prevent voids under and between conduits and at exterior surface of envelope. Do not allow a heavy mass of concrete to fall directly onto ducts. Use a plank to direct concrete down sides of bank assembly to trench bottom. Allow concrete to flow to center of bank and rise up in middle, uniformly filling all open spaces. Do not use power-driven agitating equipment unless specifically designed for duct-bank application.
4. Forms: Use walls of trench to form side walls of duct bank where soil is self-supporting and concrete envelope can be poured without soil inclusions; otherwise, use forms.
5. Stub-Ups: Use manufactured duct elbows for stub-ups at poles and equipment and at building entrances through the floor, unless otherwise indicated. Extend concrete encasement throughout the length of the elbow.
6. Warning Tape: Bury warning tape approximately 12 inches below grade, above all concrete-encased ducts and duct banks. Align tape parallel to and within 3 inches of the centerline of duct bank.

3.5 GROUNDING

A. Ground underground ducts and utility structures according to Division 26 Section "Grounding and Bonding for Electrical Systems."

3.6 FIELD QUALITY CONTROL

A. Perform the following tests and inspections and prepare test reports:

1. Demonstrate capability and compliance with requirements on completion of installation of underground ducts and utility structures.
2. Pull aluminum or wood test mandrel through duct to prove joint integrity and test for out-of-round duct. Provide mandrel equal to 80 percent fill of duct. If obstructions are indicated, remove obstructions and retest.

B. Correct deficiencies and retest as specified above to demonstrate compliance

3.7 CLEANING

A. Pull leather-washer-type duct cleaner, with graduated washer sizes, through full length of ducts. Follow with rubber duct swab for final cleaning and to assist in spreading lubricant throughout ducts.

B. Clean internal surfaces of manholes, including sump. Remove foreign material.

END OF SECTION 260543

SECTION 26 05 48 - VIBRATION AND SEISMIC CONTROLS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:

1. Isolation pads.
2. Spring isolators.
3. Restrained spring isolators.
4. Channel support systems.
5. Restraint cables.
6. Hanger rod stiffeners.
7. Anchorage bushings and washers.

B. Related Sections include the following:

1. Division 26 Section "Hangers And Supports For Electrical Systems" for commonly used electrical supports and installation requirements.

C. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 DEFINITIONS

A. The IBC: International Building Code.

B. ICC-ES: ICC-Evaluation Service.

C. OSHPD: Office of Statewide Health Planning and Development for the State of California.

1.4 PERFORMANCE REQUIREMENTS

A. Seismic-Restraint Loading:

1. Site Class as Defined in the IBC: B**.**

2. Assigned Seismic Use Group or Building Category as Defined in the IBC: III.

    a. Component Importance Factor: 1.0.
    b. Component Response Modification Factor: 2.5
    c. Component Amplification Factor: 2.5

3. Design Spectral Response Acceleration at Short Periods (0.2 Second):
4. Design Spectral Response Acceleration at 1.0-Second Period:

1.5 MRc2: CONSTRUCTION WASTE MANAGEMENT

A. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 018113 Sustainable Design Requirements.

B. EQc4.1: LOW-EMITTING MATERIALS – SEALANTS AND ADHESIVES

All sealants, adhesives, and sealant primers used on the interior of the building shall comply with the project requirements for Low-Emitting Materials – Sealants and Adhesives. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

1.6 SUBMITTALS

A. Product Data: For the following:

1. Include rated load, rated deflection, and overload capacity for each vibration isolation device.
2. Illustrate and indicate style, material, strength, fastening provision, and finish for each type and size of seismic-restraint component used.

    a. Tabulate types and sizes of seismic restraints, complete with report numbers and rated strength in tension and shear as evaluated by an agency acceptable to authorities having jurisdiction.
    b. Annotate to indicate application of each product submitted and compliance with requirements.

3. Restrained-Isolation Devices: Include ratings for horizontal, vertical, and combined loads.

B. Delegated-Design Submittal: For vibration isolation and seismic-restraint details indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1. Design Calculations: Calculate static and dynamic loading due to equipment weight and operation, seismic forces required to select vibration isolators and seismic restraints.

a. Coordinate design calculations with wind-load calculations required for equipment mounted outdoors. Comply with requirements in other Division 26 Sections for equipment mounted outdoors.

2. Indicate materials and dimensions and identify hardware, including attachment and anchorage devices.
3. Field-fabricated supports.
4. Seismic-Restraint Details:

   a. Design Analysis: To support selection and arrangement of seismic restraints. Include calculations of combined tensile and shear loads.
   b. Details: Indicate fabrication and arrangement. Detail attachments of restraints to the restrained items and to the structure. Show attachment locations, methods, and spacings. Identify components, list their strengths, and indicate directions and values of forces transmitted to the structure during seismic events.
   c. Preapproval and Evaluation Documentation: By an evaluation service member an agency acceptable to authorities having jurisdiction], showing maximum ratings of restraint items and the basis for approval (tests or calculations).

C. Coordination Drawings: Show coordination of seismic bracing for electrical components with other systems and equipment in the vicinity, including other supports and seismic restraints.

D. Welding certificates.

E. Qualification Data: For professional engineer and testing agency.

F. Field quality-control test reports.

1.7 QUALITY ASSURANCE

A. Comply with seismic-restraint requirements in the IBC unless requirements in this Section are more stringent.

B. Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

C. Seismic-restraint devices shall have horizontal and vertical load testing and analysis and shall bear anchorage pre-approval OPA number from OSHPD, pre-approval by ICC-ES, or pre-approval by another agency acceptable to authorities having jurisdiction, showing maximum seismic-restraint ratings. Ratings based on independent testing are preferred to ratings based on calculations. If pre-approved ratings are not available, submittals based on independent testing are preferred. Calculations (including combining shear and tensile loads) to support seismic-restraint designs must be signed and sealed by a qualified professional engineer.

D. Comply with NFPA 70.

PART 2 - PRODUCTS

2.1 VIBRATION ISOLATORS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Ace Mountings Co., Inc.
2. Amber/Booth Company, Inc.
3. California Dynamics Corporation.
4. Isolation Technology, Inc.
5. Kinetics Noise Control.
6. Mason Industries.
7. Vibration Eliminator Co., Inc.
8. Vibration Isolation.
9. Vibration Mountings & Controls, Inc.

B. Pads Arrange in single or multiple layers of sufficient stiffness for uniform loading over pad area, molded with a non-slip pattern and galvanized-steel base plates, and factory cut to sizes that match requirements of supported equipment.

1. Resilient Material: Oil- and water-resistant neoprene, rubber, or hermetically sealed compressed fiberglass.

C. Spring Isolators: Freestanding, laterally stable, open-spring isolators.

1. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
2. Minimum Additional Travel: 50 percent of the required deflection at rated load.
3. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
4. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
5. Base-plates: Factory drilled for bolting to structure and bonded to 1/4-inch-(thick, rubber isolator pad attached to base-plate underside. Base-plates shall limit floor load to 500 psig
6. Top Plate and Adjustment Bolt: Threaded top plate with adjustment bolt and cap screw to fasten and level equipment.

D. Restrained Spring Isolators : Freestanding, steel, open-spring isolators with seismic or limit-stop restraint.

1. Housing: Steel with resilient vertical-limit stops to prevent spring extension due to weight being removed; factory-drilled base-plate bonded to 1/4-inch- thick, neoprene or rubber isolator pad attached to base-plate underside; and adjustable equipment mounting and leveling bolt that acts as blocking during installation.
2. Restraint: Seismic or limit-stop as required for equipment and authorities having jurisdiction.
3. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
4. Minimum Additional Travel: 50 percent of the required deflection at rated load.
5. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
6. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

2.2 SEISMIC-RESTRAINT DEVICES

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Amber/Booth Company, Inc.
2. California Dynamics Corporation.
3. Cooper B-Line, Inc.; a division of Cooper Industries.
4. Hilti Inc.
5. Loos & Co.; Seismic Earthquake Division.
6. Mason Industries.
7. TOLCO Incorporated; a brand of NIBCO INC.
8. Unistrut; Tyco International, Ltd.

B. General Requirements for Restraint Components: Rated strengths, features, and application requirements shall be as defined in reports by an agency acceptable to authorities having jurisdiction.

1. Structural Safety Factor: Allowable strength in tension, shear, and pullout force of components shall be at least four times the maximum seismic forces to which they will be subjected.

C. Channel Support System: MFMA-3, shop- or field-fabricated support assembly made of slotted steel channels with accessories for attachment to braced component at one end and to building structure at the other end and other matching components and with corrosion-resistant coating; and rated in tension, compression, and torsion forces.

D. Restraint Cables: ASTM A 603 galvanized steel cables with end connections made of steel assemblies with thimbles, brackets, swivels, and bolts designed for restraining cable service; and with a minimum of two clamping bolts for cable engagement.

E. Hanger Rod Stiffener: Steel tube or steel slotted-support-system sleeve with internally bolted connection to hanger rod. Do not weld stiffeners to rods.

F. Bushings for Floor-Mounted Equipment Anchor: Neoprene bushings designed for rigid equipment mountings, and matched to type and size of anchors and studs.

G. Bushing Assemblies for Wall-Mounted Equipment Anchorage: Assemblies of neoprene elements and steel sleeves designed for rigid equipment mountings, and matched to type and size of attachment devices.

H. Resilient Isolation Washers and Bushings: One-piece, molded, oil- and water-resistant neoprene, with a flat washer face.

I. Mechanical Anchor: Drilled-in and stud-wedge or female-wedge type in zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchors with strength required for anchor and as tested according to ASTM E 488. Minimum length of eight times diameter.

J. Adhesive Anchor: Drilled-in and capsule anchor system containing polyvinyl or urethane methacrylate-based resin and accelerator, or injected polymer or hybrid mortar adhesive. Provide anchor bolts and hardware with zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength required for anchor and as tested according to ASTM E 488.

2.3 FACTORY FINISHES

A. Finish: Manufacturer's standard paint applied to factory-assembled and -tested equipment before shipping.

1. Powder coating on springs and housings.
2. All hardware shall be galvanized. Hot-dip galvanized metal components for exterior use.
3. Baked enamel or powder coat for metal components on isolators for interior use.
4. Color-code or otherwise mark vibration isolation and seismic-control devices to indicate capacity range.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and equipment to receive vibration isolation and seismic-control devices for compliance with requirements for installation tolerances and other conditions affecting performance.

B. Examine roughing-in of reinforcement and cast-in-place anchors to verify actual locations before installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 APPLICATIONS

A. Multiple Raceways or Cables: Secure raceways and cables to trapeze member with clamps approved for application by an agency acceptable to authorities having jurisdiction.

B. Hanger Rod Stiffeners: Install hanger rod stiffeners where required to prevent buckling of hanger rods due to seismic forces.

C. Strength of Support and Seismic-Restraint Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static and seismic loads within specified loading limits.

3.3 SEISMIC-RESTRAINT DEVICE INSTALLATION

A. Equipment and Hanger Restraints:

1. Install restrained isolators on electrical equipment.
2. Install resilient, bolt-isolation washers on equipment anchor bolts where clearance between anchor and adjacent surface exceeds 0.125 inch .
3. Install seismic-restraint devices using methods approved by an agency acceptable to authorities having jurisdiction providing required submittals for component.

B. Install bushing assemblies for mounting bolts for wall-mounted equipment, arranged to provide resilient media where equipment or equipment-mounting channels are attached to wall.

C. Attachment to Structure: If specific attachment is not indicated, anchor bracing to structure at flanges of beams, at upper truss chords of bar joists, or at concrete members.

D. Drilled-in Anchors:

1. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not damage existing reinforcing or embedded items during coring or drilling. Notify the structural engineer if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid pre-stressed tendons, electrical and telecommunications conduit, and gas lines.
2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.
3. Wedge Anchors: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in the structural element to which anchor is to be fastened.
4. Adhesive Anchors: Clean holes to remove loose material and drilling dust prior to installation of adhesive. Place adhesive in holes proceeding from the bottom of the hole and progressing toward the surface in such a manner as to avoid introduction of air pockets in the adhesive.
5. Set anchors to manufacturer's recommended torque, using a torque wrench.
6. Install zinc-coated steel anchors for interior and stainless-steel anchors for exterior applications.

3.4 ACCOMMODATION OF DIFFERENTIAL SEISMIC MOTION

A. Install flexible connections in runs of raceways, cables, wire-ways, cable trays, and bus-ways where they cross seismic joints, where adjacent sections or branches are supported by different structural elements, and where they terminate with connection to equipment that is anchored to a different structural element from the one supporting them as they approach equipment.

3.5 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections and prepare test reports.

B. Perform tests and inspections.

C. Tests and Inspections:

1. Provide evidence of recent calibration of test equipment by a testing agency acceptable to authorities having jurisdiction.
2. Schedule test with Owner, through Architect, before connecting anchorage device to restrained component (unless post-connection testing has been approved), and with at least seven days' advance notice.
3. Obtain Architect's approval before transmitting test loads to structure. Provide temporary load-spreading members.

4. Test at least **four** of each type and size of installed anchors and fasteners selected by Architect.
5. Test to 90 percent of rated proof load of device.
6. Measure isolator restraint clearance.
7. Measure isolator deflection.
8. Verify snubber minimum clearances.
9. If a device fails test, modify all installations of same type and retest until satisfactory results are achieved.

D. Remove and replace malfunctioning units and retest as specified above.

E. Prepare test and inspection reports.

3.6 ADJUSTING

A. Adjust isolators after isolated equipment is at operating weight.

B. Adjust limit stops on restrained spring isolators to mount equipment at normal operating height. After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.

C. Adjust active height of spring isolators.

D. Adjust restraints to permit free movement of equipment within normal mode of operation.

END OF SECTION 260548

SECTION 26 05 53 - IDENTIFICATION FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Identification for raceways.
2. Identification of power and control cables.
3. Identification for conductors.
4. Underground-line warning tape.
5. Warning labels and signs.
6. Instruction signs.
7. Equipment identification labels.
8. Miscellaneous identification products.

B. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 MRc2: CONSTRUCTION WASTE MANAGEMENT

A. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 018113 Sustainable Design Requirements.

B. EQc4.1: LOW-EMITTING MATERIALS – SEALANTS AND ADHESIVES

All sealants, adhesives, and sealant primers used on the interior of the building shall comply with the project requirements for Low-Emitting Materials – Sealants and Adhesives. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

1.4 SUBMITTALS

A. Product Data: For each electrical identification product indicated.

B. Identification Schedule: An index of nomenclature of electrical equipment and system components used in identification signs and labels.

1.5 QUALITY ASSURANCE

A. Comply with ANSI A13.1 and IEEE C2**.**

B. Comply with NFPA 70.

C. Comply with 29 CFR 1910.144 and 29 CFR 1910.145.

D. Comply with ANSI Z535.4 for safety signs and labels.

E. Adhesive-attached labeling materials, including label stocks, laminating adhesives, and inks used by label printers, shall comply with UL 969.

1.6 COORDINATION

A. Coordinate identification names, abbreviations, colors, and other features with requirements in other Sections requiring identification applications, Drawings, Shop Drawings, manufacturer's wiring diagrams, and the Operation and Maintenance Manual; and with those required by codes, standards, and 29 CFR 1910.145. Use consistent designations throughout Project.

B. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

C. Coordinate installation of identifying devices with location of access panels and doors.

D. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 - PRODUCTS

2.1 POWER RACEWAY IDENTIFICATION MATERIALS

A. Comply with ANSI A13.1 for minimum size of letters for legend and for minimum length of color field for each raceway size.

B. Colors for Raceways Carrying Circuits at 600 V or Less:

1. Black letters on an orange field.
2. Legend: Indicate voltage and system or service type**.**

C. Colors for Raceways Carrying Circuits at More Than 600 V:

1. Black letters on an orange field.

2. Legend: "DANGER CONCEALED HIGH VOLTAGE WIRING" with 3-inch- high letters on 20-inch centers.

D. Self-Adhesive Vinyl Labels for Raceways Carrying Circuits at 600 V or Less: Preprinted, flexible label laminated with a clear, weather- and chemical-resistant coating and matching wraparound adhesive tape for securing ends of legend label.

E. Snap-Around Labels for Raceways Carrying Circuits at 600 V or Less: Slit, pre-tensioned, flexible, preprinted, color-coded acrylic sleeve, with diameter sized to suit diameter of raceway or cable it identifies and to stay in place by gripping action.

F. Snap-Around, Color-Coding Bands for Raceways Carrying Circuits at 600 V or Less: Slit, pre-tensioned, flexible, solid-colored acrylic sleeve, 2 inches long, with diameter sized to suit diameter of raceway or cable it identifies and to stay in place by gripping action.

G. Tape and Stencil for Raceways Carrying Circuits More Than 600 V: 4-inch- wide black stripes on 10-inch centers diagonally over orange background that extends full length of raceway or duct and is 12 inches wide. Stop stripes at legends.

H. Metal Tags: Brass or aluminum, 2 by 2 by 0.05 inch with stamped legend, punched for use with self-locking cable tie fastener.

2.2 METAL-CLAD CABLE IDENTIFICATION MATERIALS

A. Comply with ANSI A13.1 for minimum size of letters for legend and for minimum length of color field for each raceway and cable size.

B. Colors for Raceways Carrying Circuits at 600 V and Less:

1. Black letters on an orange field.
2. Legend: Indicate voltage.

C. Self-Adhesive Vinyl Labels: Preprinted, flexible label laminated with a clear, weather- and chemical-resistant coating and matching wraparound adhesive tape for securing ends of legend label.

D. Self-Adhesive Vinyl Tape: Colored, heavy duty, waterproof, fade resistant; 2 inches wide; compounded for outdoor use.

2.3 POWER AND CONTROL CABLE IDENTIFICATION MATERIALS

A. Comply with ANSI A13.1 for minimum size of letters for legend and for minimum length of color field for each raceway and cable size.

B. Self-Adhesive Vinyl Labels: Preprinted, flexible label laminated with a clear, weather- and chemical-resistant coating and matching wraparound adhesive tape for securing ends of legend label.

C. Metal Tags: Brass or aluminum, 2 by 2 by 0.05 inch with stamped legend, punched for use with self-locking cable tie fastener.

1. Marker for Tags: Permanent, waterproof, black ink marker recommended by tag manufacturer.
2. Marker for Tags: Machine-printed, permanent, waterproof, black ink marker recommended by printer manufacturer.

D. Snap-Around Labels: Slit, pre-tensioned, flexible, preprinted, color-coded acrylic sleeve, with diameter sized to suit diameter of raceway or cable it identifies and to stay in place by gripping action.

E. Snap-Around, Color-Coding Bands: Slit, pre-tensioned, flexible, solid-colored acrylic sleeve, 2 inches long, with diameter sized to suit diameter of raceway or cable it identifies and to stay in place by gripping action.

2.4 CONDUCTOR IDENTIFICATION MATERIALS

A. Color-Coding Conductor Tape: Colored, self-adhesive vinyl tape not less than 3 mils thick by 1 to 2 inches wide.

B. Self-Adhesive Vinyl Labels: Preprinted, flexible label laminated with a clear, weather- and chemical-resistant coating and matching wraparound adhesive tape for securing ends of legend label.

C. Snap-Around Labels: Slit, pretensioned, flexible, preprinted, color-coded acrylic sleeve, with diameter sized to suit diameter of raceway or cable it identifies and to stay in place by gripping action.

D. Snap-Around, Color-Coding Bands: Slit, pretensioned, flexible, solid-colored acrylic sleeve, 2 inches long, with diameter sized to suit diameter of raceway or cable it identifies and to stay in place by gripping action.

E. Marker Tapes: Vinyl or vinyl-cloth, self-adhesive wraparound type, with circuit identification legend machine printed by thermal transfer or equivalent process.

1. Marker for Tags: Permanent, waterproof, black ink marker recommended by tag manufacturer.
2. Marker for Tags: Machine-printed, permanent, waterproof, black ink marker recommended by printer manufacturer.

2.5 FLOOR MARKING TAPE

A. 2-inch- wide, 5-mil pressure-sensitive vinyl tape, with black and white stripes and clear vinyl overlay.

2.6 UNDERGROUND-LINE WARNING TAPE

A. Tape:

1. Recommended by manufacturer for the method of installation and suitable to identify and locate underground electrical and communications utility lines.
2. Printing on tape shall be permanent and shall not be damaged by burial operations.

3. Tape material and ink shall be chemically inert, and not subject to degrading when exposed to acids, alkalis, and other destructive substances commonly found in soils.

B. Color and Printing:

1. Comply with ANSI Z535.1 through ANSI Z535.5.
2. Inscriptions for Red-Colored Tapes: ELECTRIC LINE, HIGH VOLTAGE.
3. Inscriptions for Orange-Colored Tapes: TELEPHONE CABLE, CATV CABLE, COMMUNICATIONS CABLE, OPTICAL FIBER CABLE.

2.7 WARNING LABELS AND SIGNS

A. Comply with NFPA 70 and 29 CFR 1910.145.

B. Self-Adhesive Warning Labels: Factory-printed, multicolor, pressure-sensitive adhesive labels, configured for display on front cover, door, or other access to equipment unless otherwise indicated.

C. Baked-Enamel Warning Signs:

1. Preprinted aluminum signs, punched or drilled for fasteners, with colors, legend, and size required for application.
2. 1/4-inch grommets in corners for mounting.
3. Nominal size, 7 by 10 inches.

D. Metal-Backed, Butyrate Warning Signs:

1. Weather-resistant, nonfading, preprinted, cellulose-acetate butyrate signs with 0.0396-inch galvanized-steel backing; and with colors, legend, and size required for application.
2. 1/4-inch grommets in corners for mounting.
3. Nominal size, 10 by 14 inches .

E. Warning label and sign shall include, but are not limited to, the following legends:

1. Multiple Power Source Warning: "DANGER - ELECTRICAL SHOCK HAZARD - EQUIPMENT HAS MULTIPLE POWER SOURCES."

2.8 INSTRUCTION SIGNS

A. Engraved, laminated acrylic or melamine plastic, minimum 1/16 inch thick for signs up to 20 sq. inches and 1/8 inch thick for larger sizes.

1. Engraved legend with black letters on white face.
2. Punched or drilled for mechanical fasteners.
3. Framed with mitered acrylic molding and arranged for attachment at applicable equipment.

B. Adhesive Film Label with Clear Protective Overlay: Machine printed, in black, by thermal transfer or equivalent process. Minimum letter height shall be 3/8 inch, Overlay shall provide a weatherproof and UV-resistant seal for label.

2.9 EQUIPMENT IDENTIFICATION LABELS

A. Adhesive Film Label with Clear Protective Overlay: Machine printed, in black, by thermal transfer or equivalent process. Minimum letter height shall be 3/8 inch, Overlay shall provide a weatherproof and UV-resistant seal for label.

B. Self-Adhesive, Engraved, Laminated Acrylic or Melamine Label: Adhesive backed, with white letters on a dark-gray background. Minimum letter height shall be 3/8 inch.

2.10 CABLE TIES

A. General-Purpose Cable Ties: Fungus inert, self extinguishing, one piece, self locking, Type 6/6 nylon.

1. Minimum Width: 3/16 inch.
2. Tensile Strength at 73 deg F, According to ASTM D 638: 12,000 psi.
3. Temperature Range: Minus 40 to plus 185 deg F.
4. Color: Black except where used for color-coding.

B. Plenum-Rated Cable Ties: Self extinguishing, UV stabilized, one piece, self locking.

1. Minimum Width: 3/16 inch.
2. Tensile Strength at 73 deg F, According to ASTM D 638: 7000 psi.
3. UL 94 Flame Rating: 94V-0.
4. Temperature Range: Minus 50 to plus 284 deg F.
5. Color: Black.

2.11 MISCELLANEOUS IDENTIFICATION PRODUCTS

A. Paint: Comply with requirements in Division 09 painting Sections for paint materials and application requirements. Select paint system applicable for surface material and location (exterior or interior).

B. Fasteners for Labels and Signs: Self-tapping, stainless-steel screws or stainless-steel machine screws with nuts and flat and lock washers.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Verify identity of each item before installing identification products.

B. Location: Install identification materials and devices at locations for most convenient viewing without interference with operation and maintenance of equipment.

C. Apply identification devices to surfaces that require finish after completing finish work.

D. Self-Adhesive Identification Products: Clean surfaces before application, using materials and methods recommended by manufacturer of identification device.

E. Attach signs and plastic labels that are not self-adhesive type with mechanical fasteners appropriate to the location and substrate.

F. System Identification Color-Coding Bands for Raceways and Cables: Each color-coding band shall completely encircle cable or conduit. Place adjacent bands of two-color markings in contact, side by side. Locate bands at changes in direction, at penetrations of walls and floors, at 50-foot maximum intervals in straight runs, and at 25-foot maximum intervals in congested areas.

G. Aluminum Wraparound Marker Labels and Metal Tags: Secure tight to surface of conductor or cable at a location with high visibility and accessibility.

H. Cable Ties: For attaching tags. Use general-purpose type, except as listed below:

1. Outdoors: UV-stabilized nylon.
2. In Spaces Handling Environmental Air: Plenum rated.

I. Underground-Line Warning Tape: During backfilling of trenches install continuous underground-line warning tape directly above line at 6 to 8 inches below finished grade. Use multiple tapes where width of multiple lines installed in a common trench or concrete envelope exceeds 16 inches overall.

J. Painted Identification: Comply with requirements in Division 09 painting Sections for surface preparation and paint application.

3.2 IDENTIFICATION SCHEDULE

A. Concealed Raceways, Duct Banks, More Than 600 V, within Buildings: Tape and stencil 4-inch- wide black stripes on 10-inch centers over orange background that extends full length of raceway or duct and is 12 inches wide. Stencil legend "DANGER CONCEALED HIGH VOLTAGE WIRING" with 3-inch- high black letters on 20-inch centers. Stop stripes at legends. Apply to the following finished surfaces:

1. Floor surface directly above conduits running beneath and within 12 inches of a floor that is in contact with earth or is framed above unexcavated space.
2. Wall surfaces directly external to raceways concealed within wall.
3. Accessible surfaces of concrete envelope around raceways in vertical shafts, exposed in the building, or concealed above suspended ceilings.

B. Accessible Raceways Snap-around labels. Install labels at 20-foot maximum intervals.

C. Accessible Raceways and Metal-Clad Cables, 600 V or Less, for Service, Feeder, and Branch Circuits More Than 120V to ground: Identify with self-adhesive vinyl label or self-adhesive vinyl tape applied in bands. Install labels at 30-foot maximum intervals.

D. Accessible Raceways and Cables within Buildings: Identify the covers of each junction and pull box of the following systems with self-adhesive vinyl labels with the wiring system legend and system voltage. System legends shall be as follows:

1. Emergency Power.
2. Power.
3. UPS.

E. Power-Circuit Conductor Identification, 600 V or Less: For conductors in vaults, pull and junction boxes, manholes, and handholes, use color-coding conductor tape to identify the phase.

1. Color-Coding for Phase and Voltage Level Identification, 600 V or Less: Use colors listed below for ungrounded service, feeder and branch-circuit conductors.

a. Color shall be factory applied or field applied for sizes larger than No. 8 AWG, if authorities having jurisdiction permit.
b. Colors for 208/120-V Circuits:

1) Phase A: Black.
2) Phase B: Red.
3) Phase C: Blue.
4) Neutral: White
5) Ground: Green

c. Colors for 480/277-V Circuits:

1) Phase A: Brown.
2) Phase B: Orange.
3) Phase C: Yellow.
4) Neutral: White
5) Ground: Green

d. Field-Applied, Color-Coding Conductor Tape: Apply in half-lapped turns for a minimum distance of 6 inches from terminal points and in boxes where splices or taps are made. Apply last two turns of tape with no tension to prevent possible unwinding. Locate bands to avoid obscuring factory cable markings.

F. Power-Circuit Conductor Identification, More than 600 V: For conductors in vaults, pull and junction boxes, manholes, and handholes, use write-on tags or nonmetallic plastic tag holder with adhesive-backed phase tags, and a separate tag with the circuit designation.

G. Install instructional sign including the color-code for grounded and ungrounded conductors using adhesive-film-type labels.

H. Auxiliary Electrical Systems Conductor Identification: Identify field-installed alarm, control, and signal connections.

1. Identify conductors, cables, and terminals in enclosures and at junctions, terminals, and pull points. Identify by system and circuit designation.
2. Use system of marker tape designations that is uniform and consistent with system used by manufacturer for factory-installed connections.
3. Coordinate identification with Project Drawings, manufacturer's wiring diagrams, and the Operation and Maintenance Manual.

I. Locations of Underground Lines: Identify with underground-line warning tape for power, lighting, communication, and control wiring and optical fiber cable.

1. Limit use of underground-line warning tape to direct-buried cables.
2. Install underground-line warning tape for both direct-buried cables and cables in raceway.

J. Workspace Indication: Install floor marking tape to show working clearances in the direction of access to live parts. Workspace shall be as required by NFPA 70 and 29 CFR 1926.403 unless otherwise indicated. Do not install at flush-mounted panelboards and similar equipment in finished spaces.

K. Warning Labels for Indoor Cabinets, Boxes, and Enclosures for Power and Lighting: Self-adhesive warning labels or Baked-enamel warning signs**.**

1. Comply with 29 CFR 1910.145.
2. Identify system voltage with black letters on an orange background.
3. Apply to exterior of door, cover, or other access.
4. For equipment with multiple power or control sources, apply to door or cover of equipment including, but not limited to, the following:

    a. Power transfer switches.
    b. Controls with external control power connections.

L. Operating Instruction Signs: Install instruction signs to facilitate proper operation and maintenance of electrical systems and items to which they connect. Install instruction signs with approved legend where instructions are needed for system or equipment operation.

M. Emergency Operating Instruction Signs: Install instruction signs with white legend on a red background with minimum 3/8-inch- high letters for emergency instructions at equipment used for power transfer, load shedding.

N. Equipment Identification Labels: On each unit of equipment, install unique designation label that is consistent with wiring diagrams, schedules, and the Operation and Maintenance Manual. Apply labels to disconnect switches and protection equipment, central or master units, control panels, control stations, terminal cabinets, and racks of each system. Systems include power, lighting, control, communication, signal, monitoring, and alarm systems unless equipment is provided with its own identification.

1. Labeling Instructions:

    a. Indoor Equipment: Adhesive film label with clear protective overlay,Self-adhesive, engraved, laminated acrylic or melamine label**,** Unless otherwise indicated, provide a single line of text with 1/2-inch high letters on 1-1/2-inch high label; where two lines of text are required, use labels 2 inches high.
    b. Outdoor Equipment: Engraved, laminated acrylic or melamine label, Stenciled legend 4 inches high.
    c. Elevated Components: Increase sizes of labels and letters to those appropriate for viewing from the floor.
    d. Unless provided with self-adhesive means of attachment, fasten labels with appropriate mechanical fasteners that do not change the NEMA or NRTL rating of the enclosure.

2. Equipment to Be Labeled:

    a. Panelboards: Typewritten directory of circuits in the location provided by panelboard manufacturer. Panelboard identification shall be self-adhesive, engraved, laminated acrylic or melamine label.
    b. Enclosures and electrical cabinets.
    c. Access doors and panels for concealed electrical items.

d. Switchgear.
e. Switchboards.
f. Transformers: Label that includes tag designation shown on Drawings for the transformer, feeder, and panelboards or equipment supplied by the secondary.
g. Substations.
h. Emergency system boxes and enclosures.
i. Motor-control centers.
j. Enclosed switches.
k. Enclosed circuit breakers.
l. Enclosed controllers.
m. Variable-speed controllers.
n. Push-button stations.
o. Power transfer equipment.
p. Contactors.
q. Remote-controlled switches, dimmer modules, and control devices.
r. Battery-inverter units.
s. Battery racks.
t. Power-generating units.
u. Monitoring and control equipment.
v. UPS equipment.

END OF SECTION 260553

SECTION 26 05 73 - OVERCURRENT PROTECTIVE DEVICE COORDINATION STUDY

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes computer-based, fault-current, over-current protective device coordination studies, and arc flash hazard analysis. Protective devices shall be set based on results of the protective device coordination study.

B. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 SUBMITTALS

A. Product Data: For computer software program to be used for studies.

B. Product Certificates: For coordination-study and fault-current-study computer software programs, certifying compliance with IEEE 399.

C. Qualification Data: For coordination-study specialist.

D. SKM resident master files upon approval of studies.

E. Other Action Submittals: The following submittals shall be made after the approval process for system protective devices has been completed. Submittals shall be in electronic-copy and hard-copy formats.

1. Coordination-study input data, including completed computer program input data sheets.
2. Study and Equipment Evaluation Reports.
3. Coordination-Study Report.
4. Arc flash hazard analysis.

1.4 QUALITY ASSURANCE

A. Studies shall use computer programs that are distributed nationally and are in wide use. Software algorithms shall comply with requirements of standards and guides specified in this Section. Manual calculations are not acceptable.

B. Coordination-Study Specialist Qualifications: An entity experienced in the application of computer software used for studies, having performed successful studies of similar magnitude on electrical distribution systems using similar devices.

C. Comply with IEEE 242 for short-circuit currents and coordination time intervals.

D. Comply with IEEE 399 for general study procedures.

PART 2 - PRODUCTS

2.1 COMPUTER SOFTWARE DEVELOPERS

A. Available Computer Software Developers: Subject to compliance with requirements, companies offering computer software programs that may be used in the Work include, but are not limited to, the following:
1. SKM Systems Analysis, Inc. (no subsutitution)

2.2 COMPUTER SOFTWARE PROGRAM REQUIREMENTS

A. Comply with IEEE 399.

B. Analytical features of fault-current-study computer software program shall include "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.

C. Computer software program shall be capable of plotting and diagramming time-current-characteristic curves as part of its output. Computer software program shall report device settings and ratings of all over-current protective devices and shall demonstrate selective coordination by computer-generated, time-current coordination plots.

1. Also provide the following features:

a. Arcing faults.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine Project over-current protective device submittals for compliance with electrical distribution system coordination requirements and other conditions affecting performance. Devices to be coordinated are indicated on Drawings.

1. Proceed with coordination study only after relevant equipment submittals have been assembled. Over-current protective devices that have not been submitted and approved prior to coordination study may not be used in study.

3.2 POWER SYSTEM DATA

A. Gather and tabulate the following input data to support coordination study:

1. Product Data for over-current protective devices specified in other Division 26 Sections and involved in over-current protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, over-current protective device submittals, input and output data, and recommended device settings.
2. Impedance of utility service entrance.
3. Electrical Distribution System Diagram: In hard-copy and electronic-copy formats, showing the following:

    a. Circuit-breaker and fuse-current ratings and types.
    b. Relays and associated power and current transformer ratings and ratios.
    c. Transformer kilovolt amperes, primary and secondary voltages, connection type, impedance, and X/R ratios.
    d. Generator kilovolt amperes, size, voltage, and source impedance.
    e. Cables: Indicate conduit material, sizes of conductors, conductor material, insulation, and length.
    f. Bus-way ampacity and impedance.
    g. Motor horsepower and code letter designation according to NEMA MG 1.

4. Data sheets to supplement electrical distribution system diagram, cross-referenced with tag numbers on diagram, showing the following:

    a. Special load considerations, including starting inrush currents and frequent starting and stopping.
    b. Transformer characteristics, including primary protective device, magnetic inrush current, and overload capability.
    c. Motor full-load current, locked rotor current, service factor, starting time, type of start, and thermal-damage curve.
    d. Generator thermal-damage curve.
    e. Ratings, types, and settings of utility company's overcurrent protective devices.
    f. Special overcurrent protective device settings or types stipulated by utility company.
    g. Time-current-characteristic curves of devices indicated to be coordinated.
    h. Manufacturer, frame size, interrupting rating in amperes rms symmetrical, ampere or current sensor rating, long-time adjustment range, short-time adjustment range, and instantaneous adjustment range for circuit breakers.
    i. Manufacturer and type, ampere-tap adjustment range, time-delay adjustment range, instantaneous attachment adjustment range, and current transformer ratio for overcurrent relays.
    j. Panelboards, switchboards, motor-control center ampacity, and interrupting rating in amperes rms symmetrical.

3.3 FAULT-CURRENT STUDY

A. Calculate the maximum available short-circuit current in amperes rms symmetrical at circuit-breaker positions of the electrical power distribution system. The calculation shall be for a current immediately after initiation and for a three-phase bolted short circuit at each of the following:

1. 15 KV switchgear.
2. 480V Switchgear and switchboards.
3. Medium-voltage controller.
4. Motor-control center.
5. Distribution panelboard.
6. Branch circuit panelboard.
7. Existing panelboards in OSTC.

B. Study electrical distribution system from normal and alternate (emergency) power sources throughout electrical distribution system for Project. Include studies of system-switching configurations and alternate operations that could result in maximum fault conditions. Include existing panles in OSTC up to 120/208v, 100A panels and feeders larger than 60A.

C. Calculate momentary and interrupting duties on the basis of maximum available fault current.

D. Calculations to verify interrupting ratings of overcurrent protective devices shall comply with IEEE 141 and IEEE 242.

1. Transformers:

a. ANSI C57.12.10.
b. ANSI C57.12.22.
c. ANSI C57.12.40.
d. IEEE C57.12.00.
e. IEEE C57.96.

2. Low-Voltage Circuit Breakers: IEEE 1015 and IEEE C37.20.1.
3. Low-Voltage Fuses: IEEE C37.46.

E. Study Report:

1. Show calculated X/R ratios and equipment interrupting rating (1/2-cycle) fault currents on electrical distribution system diagram.

F. Equipment Evaluation Report:

1. For 600-V overcurrent protective devices, ensure that interrupting ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.
2. For devices and equipment rated for asymmetrical fault current, apply multiplication factors listed in the standards to 1/2-cycle symmetrical fault current.
3. Verify adequacy of phase conductors at maximum three-phase bolted fault currents; verify adequacy of equipment grounding conductors and grounding electrode conductors at maximum ground-fault currents. Ensure that short-circuit withstand ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.

3.4 COORDINATION STUDY

A. Perform coordination study using approved computer software program. Prepare a written report using results of fault-current study. Comply with IEEE 399.

1. Calculate the maximum and minimum 1/2-cycle short-circuit currents.

2. Calculate the maximum and minimum interrupting duty (5 cycles to 2 seconds) short-circuit currents.
3. Calculate the maximum and minimum ground-fault currents.

B. Comply with IEEE 242 recommendations for fault currents and time intervals.

C. Transformer Primary Overcurrent Protective Devices:

1. Device shall not operate in response to the following:

   a. Inrush current when first energized.
   b. Self-cooled, full-load current or forced-air-cooled, full-load current, whichever is specified for that transformer.
   c. Permissible transformer overloads according to IEEE C57.96 if required by unusual loading or emergency conditions.

2. Device settings shall protect transformers according to IEEE C57.12.00, for fault currents.

D. Conductor Protection: Protect cables against damage from fault currents according to ICEA P-32-382, ICEA P-45-482, and conductor melting curves in IEEE 242. Demonstrate that equipment withstands the maximum short-circuit current for a time equivalent to the tripping time of the primary relay protection or total clearing time of the fuse. To determine temperatures that damage insulation, use curves from cable manufacturers or from listed standards indicating conductor size and short-circuit current.

E. Coordination-Study Report: Prepare a written report indicating the following results of coordination study:

1. Tabular Format of Settings Selected for Over-current Protective Devices:

   a. Device tag.
   b. Relay-current transformer ratios; and tap, time-dial, and instantaneous-pickup values.
   c. Circuit-breaker sensor rating; and long-time, short-time, and instantaneous settings.
   d. Fuse-current rating and type.
   e. Ground-fault relay-pickup and time-delay settings.

2. Coordination Curves: Prepared to determine settings of over-current protective devices to achieve selective coordination. Graphically illustrate that adequate time separation exists between devices installed in series, including power utility company's upstream devices. Prepare separate sets of curves for the switching schemes and for emergency periods where the power source is local generation. Show the following information:

   a. Device tag.
   b. Voltage and current ratio for curves.
   c. Three-phase and single-phase damage points for each transformer.
   d. No damage, melting, and clearing curves for fuses.
   e. Cable damage curves.
   f. Transformer inrush points.
   g. Maximum fault-current cutoff point.

F. Completed data sheets for setting of overcurrent protective devices.

3.5 ARC-FLASH HAZARD ANALYSIS

A. The Arc-Flash Hazard Analysis shall be performed with the aid of computer software intended for this purpose in order to calculate Arc-Flash Incident Energy (AFIE) levels and flash protection boundary distances.

B. The Arc-Flash Hazard Analysis shall be performed in conjunction with a short-circuit analysis and a time-current coordination analysis.

C. Results of the analysis shall be submitted in tabular form, and shall include device or bus name, bolted fault and arcing fault current levels, flash protection boundary distances, personal-protective equipment classes and AFIE levels.

D. The analysis shall be performed under worst-case Arc-Flash conditions, and the final report shall describe, when applicable, how these conditions differ from worst-case bolted fault conditions.

E. The Arc-Flash Hazard Analysis shall be performed in compliance with IEEE Standard 1584-2002, the IEEE “Guide for Performing Arc-Flash Calculations”.

F. Labeling on equipment shall be in compliance with NEC 2008 Chapter 1, Article “Flash Protection” and ANSI Z535.4 to identify AFIE and appropriate Personal Protective Equipment classes.

G. Perform analysis and provide labeling on the following:

1. All new Medium Voltage Switchgear
2. All new Low Voltage Switchgear, Motor Control Center, Switchboards, and Panelboards.
3. All existing panleboards in OSTC.
4. All disconnects 60A or larger.

END OF SECTION 260573

SECTION 26 08 00 – COMMISSIONING OF ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 DESCRIPTION

A. The purpose of this section is to specify Division 26 responsibilities in the commissioning process which are being directed by the CA. Other electrical systems testing are required under the direction of the CT.

B. The list of commissioned equipment and systems is found in Section 019113.

C. Commissioning requires the participation of Division 26 to ensure that all systems are operating in a manner consistent with the Contract Documents. The general commissioning requirements and coordination are detailed in Section 019113. Division 26 shall be familiar with all parts of Section 019113 and the commissioning plan issued by the CA and shall execute all commissioning responsibilities assigned to them in the Contract Documents.

1.3 RESPONSIBILITIES

A. Electrical Contractors. The commissioning responsibilities applicable to the electrical contractor are as follows *(all references apply to commissioned equipment)*:

Construction and Acceptance Phases

1. Attend a commissioning scoping meeting and other necessary meetings scheduled by the CA to facilitate the Cx process.
2. Contractors shall provide normal cut sheets and shop drawing submittals to the CA of commissioned equipment.
3. Provide additional requested documentation, prior to normal O&M manual submittals, to the CA for development of start-up and functional testing procedures.
    a. Typically this will include detailed manufacturer installation and start-up, operating, troubleshooting and maintenance procedures, full details of any owner-contracted tests, fan and pump curves, full factory testing reports, if any, and full warranty information, including all responsibilities of the Owner to keep the warranty in force clearly identified. In addition, the installation and checkout materials that are actually shipped inside the equipment and the actual field checkout sheet forms to be used by the factory or field technicians shall be submitted to the Commissioning Agent.
    b. The Commissioning Agent may request further documentation necessary for the commissioning process.
    c. This data request may be made prior to normal submittals.
4. Provide a copy of the O&M manuals submittals of commissioned equipment, through normal channels, to the CA for review.
5. Contractors shall assist (along with the design engineers) in clarifying the operation and control of commissioned equipment in areas where the specifications, control drawings or equipment documentation is not sufficient for writing detailed testing procedures.

6. Provide assistance to the CA in preparation of the specific functional performance test procedures specified in this section. Subs shall review test procedures to ensure feasibility, safety and equipment protection and provide necessary written alarm limits to be used during the tests.
7. Develop a full start-up and initial checkout plan using manufacturer's start-up procedures and the pre-functional checklists from the CA. Submit manufacturer's detailed start-up procedures and the full start-up plan and procedures and other requested equipment documentation to CA for review.
8. During the startup and initial checkout process, execute and document the electrical-related portions of the pre-functional checklists provided by the CA for all commissioned equipment.
9. Perform and clearly document all completed start-up and system operational checkout procedures, providing a copy to the CA.
10. Address current A/E punch list items before functional testing. Air and water TAB shall be completed with discrepancies and problems remedied before functional testing of the respective air- or water-related systems.
11. Provide skilled technicians to execute starting of equipment and to execute the functional performance tests. Ensure that they are available and present during the agreed upon schedules and for sufficient duration to complete the necessary tests, adjustments and problem-solving.
12. Perform functional performance testing under the direction of the CA for specified equipment in this section and 019113. Assist the CA in interpreting the monitoring data, as necessary.
13. Correct deficiencies (differences between specified and observed performance) as interpreted by the CA, CT and A/E and retest the equipment.
14. Prepare O&M manuals according to the Contract Documents, including clarifying and updating the original sequences of operation to as-built conditions.
15. During construction, maintain as-built red-line drawings for all drawings and final CAD as-builts for contractor-generated coordination drawings. Update after completion of commissioning (excluding deferred testing). Prepare red-line as-built drawings for all drawings and final as-built for contractor-generated coordination drawings.
16. Provide training of the Owner's operating personnel as specified.
17. Coordinate with equipment manufacturers to determine specific requirements to maintain the validity of the warranty.

Warranty Period

1. Execute seasonal or deferred functional performance testing, witnessed by the CA, according to the specifications.
2. Correct deficiencies and make necessary adjustments to O&M manuals and as-built drawings for applicable issues identified in any seasonal testing.

B. Electrical Designer/Engineer

1. Refer to Section 019113 for the responsibilities of the Electrical Designer/Engineer.

1.4 RELATED WORK

A. Refer to Section 019113, Part 1.4 for a listing of all sections where commissioning requirements are found.

B. Refer to Section 019113 Part 1.7 for systems to be commissioned and this section for functional testing requirements.

PART 2 - PRODUCTS

2.1 TEST EQUIPMENT

A. Division 26 shall provide all test equipment necessary to fulfill the testing requirements of this Division.

B. Refer to Section 019113 Part 2.1 for additional Division 26 requirements.

PART 3 - EXECUTION

3.1 SUBMITTALS

A. Division 26 shall provide submittal documentation relative to commissioning to the CA as requested by the CA. Refer to Section 019113 Part 3.3 for additional Division 26 requirements.

3.2 START-UP

A. The electrical contractors shall follow the start-up and initial checkout procedures listed in the Responsibilities list in this section and in 019113 Part 3.4. Division 26 has start-up responsibility and is required to complete systems and sub-systems so they are fully functional, meeting the design objectives of the Contract Documents. The commissioning procedures and functional testing do not relieve or lessen this responsibility or shift that responsibility partially to the commissioning agent or Owner.

B. Functional testing is intended to begin upon completion of a system. Functional testing may proceed prior to the completion of systems, or sub-systems at the discretion of the CA and CT. Beginning system testing before full completion does not relieve the Contractor from fully completing the system, including all pre-functional checklists as soon as possible.

3.3 FUNCTIONAL PERFORMANCE TESTS

A. Refer to Section 019113 Part 1.7 for a list of systems to be commissioned, 019113 Part 3.6 for a description of the process and to the appendices in this section for specific details on the required functional performance tests.

3.4 TESTING DOCUMENTATION, NON-CONFORMANCE AND APPROVALS

A. Refer to Section 019113 Part 3.4 and 3.7 for specific details on non-conformance issues relating to pre-functional checklists and tests.

B. Refer to Section 019113 Part 3.6 for issues relating to functional performance tests.

3.5 OPERATIONS AND MAINTENANCE (O&M) MANUALS

A. Division 26 shall compile and prepare documentation for all equipment and systems covered in Division 26 and deliver to the CT for inclusion in the O&M manuals, according to Sections 017823 and 019113.
B. The CA shall receive a copy of the O&M manuals for review.

3.6 TRAINING OF OWNER PERSONNEL

A. The CT shall be responsible for training coordination and scheduling and ultimately to ensure that training is completed. Refer to Section 019113 for additional details.

B. The CA shall be responsible for overseeing and approving the content and adequacy of the training of Owner personnel for commissioned equipment. Refer to Section 019113 for additional details.

C. Electrical Contractor. The electrical contractor shall have the following training responsibilities:

1. Provide the CA with a training plan eight a minimum of (8) weeks before the planned training according to the outline described in Section 019113, Part 3.9.
2. Provide designated Owner personnel with comprehensive training in the understanding of the systems and the operation and maintenance of each major piece of commissioned electrical equipment or system.
3. Training shall start with classroom sessions, if necessary, followed by hands on training on each piece of equipment, which shall illustrate the various modes of operation, including start-up, shut down, fire/smoke alarm, power failure, etc.
4. During any demonstration, should the system fail to perform in accordance with the requirements of the O&M manual or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.
5. The appropriate trade or manufacturer's representative shall provide the instructions on each major piece of equipment. This person may be the start-up technician for the piece of equipment, the installing contractor or manufacturer's representative. Practical building operating expertise as well as in-depth knowledge of all modes of operation of the specific piece of equipment is required. More than one party may be required to execute the training.
6. The training sessions shall follow the outline in the Table of Contents of the operation and maintenance manual and illustrate whenever possible the use of the O&M manuals for reference.
7. Training shall include:
    a. Use the printed installation, operation and maintenance instruction material included in the O&M manuals.
    b. Include a review of the written O&M instructions emphasizing safe and proper operating requirements, preventative maintenance, special tools needed and spare parts inventory suggestions. The training shall include start-up, operation in all modes possible, shut down, seasonal changeover and any emergency procedures.
    c. Discuss relevant health and safety issues and concerns.
    d. Discuss warranties and guarantees.
    e. Cover common troubleshooting problems and solutions.
    f. Explain information included in the O&M manuals and the location of all plans and manuals in the facility.
    g. Discuss any peculiarities of equipment installation or operation.
    h. The format and training agenda in *Guidelines for Commissioning HVAC Systems*, ASHRAE, Guideline 0-2005.
    i. Classroom sessions shall include the use of overhead projections, slides, video and audio taped material as might be appropriate.
8. Hands-on training shall include start-up, operation in all modes possible, including manual, shut down and any emergency procedures and maintenance of all pieces of equipment.
9. The electrical contractor shall fully explain and demonstrate the operation, function and overrides of any local packaged controls, not *controlled* by the central control system.
10. Training shall occur after functional testing is complete, unless approved otherwise by the Project Manager.
11. Duration of Training. The CT and EC shall provide training and demonstration requirements as specified in each specification section and Section 019113.

3.7 WRITTEN WORK PRODUCTS

A. Written work products of Contractors will consist of the start-up and initial checkout plan described in Section 019113 and the filled out start-up, initial checkout and pre-functional checklists.

4.0 SAMPLE FORMS

4.1 ELECTRICAL TESTING REQUIREMENTS

This section specifies the functional testing requirements for Division 01 systems and equipment. From these requirements, the Commissioning Authority (CA) shall develop step-by-step procedures to be executed by the contractor. The general functional testing process, requirements and test method definitions are described in Section 019113. The test requirements for each piece of equipment or system contain the following:

1. The contractors responsible to execute the tests, under the direction of the CA.
2. A list of the integral components being tested.
3. Pre-functional checklists associated with the components.
4. Functions and modes to be tested.
5. Required conditions of the test for each mode.
6. Special procedures.
7. Required methods of testing.
8. Required monitoring.
9. Acceptance criteria.
10. Sampling strategies allowed.

TESTING

A. A listing of the systems and equipment to be tested are included on the following pages to illustrate the extent of testing to be provided. The actual forms for this section will be produced by the CA before the testing.

B. Additional systems and included may be included for testing as required at the discretion of the CA in order to fulfill LEED Commissioning Requirements.

C. Testing for the electrical power distribution system and fire alarm system supporting the mechanical equipment will be integrated into the testing for each mechanical system as necessary.

1. LIGHTING CONTROLS

The testing requirements apply to the lighting system for the building.

A. Parties Responsible to Execute Functional Test
1. Electrical contractor: operate the lighting system, measure lighting levels of finished spaces (foot candles).
2. CA: to witness, direct and document testing.

B. Integral Components or Related Equipment Being Tested — Pre-functional Checklist ID
1. Lighting Controls — PFC-_____

C. Prerequisites The applicable prerequisite checklist items listed in the beginning of Section 16996 shall be listed on each functional test form and checked off prior to functional testing. The commissioning agent may also spot-check misc. items and calibrations on the pre-functional checklists previously completed by the installer, before the beginning of functional testing.

D. Functions/Modes Required To Be Tested, Test Methods and Seasonal Test Requirements
The following testing requirements are in addition to and do not replace any testing requirements elsewhere in this Division.

	Function/Mode	**Test Method Manual, Monitoring, Either or Both[1]**	**Required Seasonal Test**
General			
1.	Lighting levels (foot candles)	Manual	
2.	Occupancy sensor (response to motion/sound)	Manual	
3.	Occupancy sensor (timed shutoff)	Manual	
4.	Daylighting level reductions (foot candles) – if applicable	Manual	
5.	Schedule (time clock) – if applicable	Either	

E. Special Procedures (other equipment to test with, etc.; reference to function ID)

1. None

F. Required Monitoring

1. None.

G. Acceptance Criteria (referenced by function or mode ID)
1-6. For the conditions, sequences and modes tested, the fans, integral components and related equipment respond to changing conditions and parameters appropriately as expected, as specified and according to acceptable operating practice.

H. Sampling Check Scope Strategy for Identical Units of the same type and function, but different in size, are considered identical for sampling purposes.

1. Randomly test at least 20% of the individual room lighting levels and occupancy sensors. Lighting time clock systems shall be tested 100% to verify occupancy schedule. If 10% of the units in the first sample fail the functional performance

tests, test another 10% of the group (the 2nd sample). If 10% of the units in the 2nd sample fail, test all remaining units in the whole group, fully at the contractor's expense. This sampling applies to the testing subsections. That is, if calibration is off on more than 10% of the tested piece of equipment, then another sample shall have calibrations checked, but not all other tests need to be done on the second sample.

END OF REQUIREMENTS FOR LIGHTING CONTROL TEST

5.0 PRE-FUNCTIONAL CHECKLISTS

Pre-functional checklists shall be developed by the CA and completed by the Contractor for the following equipment/systems:

Room Lighting Controls – Sensors and Switches
Electrical Distribution Panels

The attached sample checklist is intended to serve as an example only. They are not detailed for this project and do not include all the requirements. The actual pre-functional checklists for each piece of equipment and system will be developed by the CA after the submittals have been approved and they will be reviewed by the Cx Team prior to distribution for use. The pre-functional checklists will be written to verify conformance to the requirements of the plans, specifications, manufacturer's product information and actual field conditions prior to proceeding with functional performance testing. The following sample checklists are attached:

1. Room Lighting Controls

PREFUNCTIONAL CHECKLIST: LIGHTING CONTROLS

1. Submittal/Approvals

Submittal. The above equipment and systems integral to them are complete and ready for functional testing. The checklist items are complete and have been checked off only by parties having direct knowledge of the event, as marked below, respective to each responsible contractor. This pre-functional checklist is submitted for approval, subject to an attached list of outstanding items yet to be completed. A Statement of Correction will be submitted upon completion of any outstanding areas. None of the outstanding items preclude safe and reliable functional tests being performed. ___ List attached.

Electrical Contractor	Date	Construction manager	Date

Pre-functional checklist items are to be completed as part of startup & initial checkout, preparatory to functional testing.

- This checklist does not take the place of the manufacturer's recommended checkout and startup procedures or report.
- Items that do not apply shall be noted with the reasons on this form (N/A = not applicable, BO = by others).
- If this form is not used for documenting, one of similar rigor shall be used.
- Contractors assigned responsibility for sections of the checklist shall be responsible to see that checklist items by their subcontractors are completed and checked off.

Approvals. This filled-out checklist has been reviewed. Its completion is approved with the exceptions noted below.

Commissioning Agent	Date	Owner's Representative	Date

Documentation — Complete:

Yes/No/NA	Item Check	Yes/No/NA	Item Check
	1. Manufacturer's submittals/shop drawings approved by A/E		2. Submittals/shop drawings include installation & startup manual and plan
	3. O&M manuals approved by A/E		4. Warranty certificate

Model Verification — Complete:

	Specified	Submitted	Installed
Lighting Panel Tag			
Circuit Numbers			
Lighting Control Manufacturer			
Model Number			
Serial Number			

Installation Checks — Complete:

Installation

Yes/No/NA	Item Check	Yes/No/NA	Item Check
	1. Panel and circuit breakers installed per manufacturer's instructions and specifications		2. Lights installed agree with shop drawings and specifications
	3. Verify mounting, location, and clearances are per plans and specs		4. Lighting controllers (occupancy sensors and switches) installed as required
	5. All zone circuits and inputs are correctly wired, circuits labeled		

Operational Performance Test — Complete:

Operational Checks

Yes/No/NA	Item Check	Yes/No/NA	Item Check
	1. Emergency lights connected to back up power source as required.		2. Emergency lights operate per plan.
	3. Occupancy sensors react to motion/sound activation per requirements. Response Time = _____ seconds		3. Timers for occupancy sensors set per requirements. Shutoff Time = _____ minutes

--- End of Checklist ---

6.0 FUNCTIONAL PERFORMANCE TESTS

Functional performance test procedures shall be developed by the CA and executed by the Contractor with coordination from the CA for the following equipment/systems:

Room Lighting Controls – Sensors and Switches
Electrical Distribution Panels

The attached sample functional performance tests are intended to serve as examples only. They are not detailed for this project and do not include all the requirements. Actual functional performance tests will be developed by the CA after the submittals have been approved and will be reviewed by the Cx Team prior to distribution for use. The functional performance tests will be written to verify conformance to the requirements of the plans, specifications, manufacturer's product information and actual field conditions. The following sample functional performance tests are attached:

1. Room Lighting Controls

FUNCTIONAL PERFORMANCE TEST
LIGHTING CONTROLS

1. Participants:

Representing	**Participant**

Party filling out this form & witnessing _____ Date of Test: _____

Time Clock Information

Manufacturer# _____

Model #: _____ Serial #: _____

Location: _____ Area Served: Corridors

2. Prerequisite Checklist:

a. The following have been started up, startup reports provided, and prefunctional checklists submitted and approved prior to functional testing - Y/N: _____

b. These functional test procedures reviewed by installing contractors and are acceptable for use for the FPTs - Y/N: _____

3. Record of All Values:
Record of "All Values for Current Setpoints(SP), Control Parameters, Limits, Delays, Lockouts, Schedules, etc., changed to accommodate testing:

Parameter	Pre-Test Values	Returned to Pre-Test Values
Occupancy Schedule – Monday		
Occupancy Schedule – Tuesday		
Occupancy Schedule – Wednesday		
Occupancy Schedule – Thursday		
Occupancy Schedule – Friday		
Occupancy Schedule – Saturday		
Occupancy Schedule – Sunday		
Occupancy Sensor – Timed Shut Off		

4. Functional Performance Testing Record for Time Clocks: For the functional performance test for the time clock and corridors, verify occupancy schedule set in time clock is correct and operational, lighting levels meet ,specified requirements, and emergency lights function as required

Lighting Control	Action/Setting	Operational (O) or Non-Operational(NO)	Pass Y/N	Note

END OF SECTION 26 08 00

SECTION 26 11 16.11

SECONDARY UNIT SUBSTATIONS – SECONDARY LESS THAN 1000 V

PART 1 GENERAL

1.01 SCOPE

A. The Contractor shall furnish and install the secondary unit substation(s) complete from the incoming line terminals to the outgoing line terminals as specified herein and as shown on the contract drawings.

B. The secondary unit substation shall consist of primary equipment, transformer and secondary equipment as specified below. The manufacturer of the unit substation shall furnish and coordinate all major components of the substations, including incoming primary equipment section, transformer and low-voltage section, as well as circuit breakers, fusible switches, and metering components. Provide a single warranty covering all substation assemblies, transformers and components.

C. Connections between the primary device and transformer shall be bus, and between the transformer and secondary shall be flexible bus braid.

D. Outdoor primary and secondary equipment where specified shall be of weatherproof construction, rodent proof and shall contain 120-volt space heaters, receptacles and lighting as required.

1.02 RELATED SECTIONS

A. Section 16322A – Substation Transformers – Liquid-Filled

B.

C. Section 16361B – Medium Voltage Switches – 5/15 kV – Line-up

D. Section 16426A – Metal-Enclosed Drawout Switchgear (Magnum DS) – Low Voltage

1.03 REFERENCES

A. The secondary unit substation shall be designed, assembled, tested and installed in accordance with latest applicable standards of NEMA, IEEE and ANSI, applicable to its three major sections:

1. MV Load Interrupter Switchgear – NEMA SG4, SG5; ANSI C37
2. MV Motor Controllers – ANSI/NEMA ICS-3-Part 2, UL347
3. Secondary Substation Transformers – NEMA 210, IEEE 100, ANSI C57
4. LV Distribution Switchboards – NEMA PB-2, UL 891

1.04 SUBMITTALS – FOR REVIEW/APPROVAL

A. The following information shall be submitted to the Engineer:
   1. Master drawing index
   2. Front view elevation
   3. Floor plan
   4. Single line
   5. Schematic diagram
   6. Nameplate schedule
   7. Component list
   8. Conduit entry/exit locations
   9. Assembly ratings including:
      a. Short-circuit rating
      b. Voltage
      c. Continuous current
      d. Basic Impulse level for equipment over 600 volts
      e. kVA
   10. Major component ratings including:
      a. Voltage
      b. Continuous current
      c. Interrupting ratings
   11. Cable terminal sizes
   12. Connection details between close-coupled assemblies
   13. Composite front view and floor plan of close-coupled assemblies
   14. Impedance for transformers
   15. Product data sheets

B. Where applicable, the following additional information shall be submitted to the Engineer:
   1. Busway connection
   2. Key interlock scheme drawing and sequence of operation

1.05 SUBMITTALS – FOR CONSTRUCTION

A. The following information shall be submitted for record purposes:
   1. Final as-built drawings and information for items listed Paragraph 1.04, and shall incorporate all changes made during the manufacturing process
   2. Wiring diagrams
   3. Certified production test reports
   4. Installation information

5. Seismic certification as specified

1.06 QUALIFICATIONS

A. The manufacturer of the assembly shall be the manufacturer of the major components within the assembly.

B. For the equipment specified herein, the manufacturer shall be ISO 9001 or 9002 certified.

C. The manufacturer of this equipment shall have produced similar electrical equipment for a minimum period of five (5) years. When requested by the Engineer, an acceptable list of installations with similar equipment shall be provided demonstrating compliance with this requirement.

   a. The equipment manufacturer shall certify that the equipment can withstand, that is, function following the seismic event, including both vertical and lateral required response spectra as specified in above codes.

   b. The equipment manufacturer shall document the requirements necessary for proper seismic mounting of the equipment. Seismic qualification shall be considered achieved when the capability of the equipment, meets or exceeds the specified response spectra.

1.07 REGULATORY REQUIREMENTS

A. Certified copies of production test reports shall be supplied demonstrating compliance with these standards when requested by the engineer.

1.08 DELIVERY, STORAGE AND HANDLING

A. Equipment shall be handled and stored in accordance with manufacturer's instructions. One (1) copy of these instructions shall be included with the equipment at time of shipment.

1.09 OPERATION AND MAINTENANCE MANUALS

A. Equipment operation and maintenance manuals shall be provided with each assembly shipped and shall include instruction leaflets, instruction bulletins, and renewal parts lists where applicable for the complete assembly and each major component.

PART 2A PRODUCTS – PRIMARY EQUIPMENT

2.01 MANUFACTURERS

A. Eaton Corporation

B. General Electric

C. Siemens

The listing of specific manufacturers above does not imply acceptance of their products that do not meet the specified ratings, features and functions. Manufacturers listed above are not

relieved from meeting these specifications in their entirety. Products in compliance with the specification and manufactured by others not named will be considered only if pre-approved by the Engineer ten (10) days prior to bid date.

2.02 RATINGS

A. Switchgear assembly ratings shall be as follows:

1.	Nominal System Voltage	15kV three-phase three wire
2.	System Grounding	solid
3.	Rated Maximum Voltage	15 kV
4.	Rated Lightning Impulse Withstand Voltage (BIL)	95 kV for 15 kV assemblies
5.	Arc Resistant Accessibility Type	Type 2B per IEEE C37.20.7
6.	Main Cross Bus Continuous Current	600 A
7.	Main Cross Bus Momentary Current (10 Cycle)	40 kA rms Asym/_65 kA peak
8.	Main Cross Bus 2-Second Short Circuit Current	25 kA rms Sym
9.	Enclosure Internal Arc Short Circuit Rating	40 kA rms Sym/65 kA peak
10.	Enclosure Internal Arc Short Circuit Duration	0.5 second
11.	Non-Fused Switch (Continuous and Load Break current)	600Amperes
12.	Non-Fused Switch Fault Close and Momentary withstand	40kA rms Asym
13.	Non-Fused Switch 2-Second Short-time short-circuit current	25kA rms Sym
14.	Fuse Rating	As shown on drawings
15.	Type of Fuse	RBA-400____
16.	Fuse Interrupting Rating	25kA Sym RMS
17.	Fused Switch Fault close & Momentary	40kA Asym RMS

2.03 5 AND 15 KV CONSTRUCTION

A. The metal-enclosed load interrupter switchgear shall consist of deadfront, completely metal-enclosed vertical sections containing load interrupter switches and fuses (where shown) of the number, rating and type noted on the drawings or specified herein.

B. The following features shall be supplied on every vertical section containing a three-pole, two-position open-closed switch:

1. A minimum 5-inch x 18-inch high-impact viewing window that permits full view of the position of all three switch blades through the closed door. Open Switch Blades should provide adequate AIR (normal air) clearance to provide full dielectric insulation between Line and load per IEEE C37.30.4 without the use of insulators or insulating gasses. The window shall not be more than 58-inches above the switch pad level to allow ease of inspection
2. The fuse compartment door shall be interlocked with the switch so that:
   a. The switch must be opened before the fuse compartment door can be opened.
   b. The fuse compartment door must be closed before the switch can be closed.
3. Switch compartment door shall be interlocked such that it cannot be opened until the switch has been locked open and fuse compartment door has been unlocked and opened.
4. Provision for padlocking the switch in the open or closed position
5. Green OPEN, Red CLOSED switch position indicators with the words “Open” and “Closed” in French, Spanish and English
6. A hinged cover with rustproof quarter turn nylon latches over the switch operating mechanism to discourage casual tampering
7. The switch shall be removable from the structure as a complete operational component

C. Vertical section construction shall be of the universal frame type using die-formed and bolted parts. All enclosing covers and doors shall be fabricated from steel with thickness equal to or greater than that specified in ANSI/IEEE C37.20.3. No owner removable hardware for covers or doors shall be thread-forming type. To facilitate installation and maintenance of cables and bus in each vertical section, padlockable hinged rear covers held closed by bolts shall be provided.

D. Each vertical section containing a switch shall have hinged, bolted upper and lower front doors for access to load interrupter switch and fuse compartments. Switch operating mechanism shall be easily accessible from the front without requiring opening of main front doors. Removable handle shall be provided for manual operation of the switch. Provide storage provision for the removable handle within the switch operating mechanism box.

E. Each load interrupter switch shall have the following features:
   1. Three-pole gang-operated mechanism
   2. Manual quick-make, quick-break over-toggle-type mechanism that does not require the use of a chain or a cable for operation, and utilizes a heavy-duty coil spring to provide opening and closing energy
   3. The speed of opening and closing the switch shall be independent of the operator, and it shall be impossible to tease the switch into any intermediate position under normal operation
   4. Separate main and break contacts to provide maximum endurance for fault close and load interrupting duty

5. Insulating barriers between each phase and between the outer phases and the enclosure
6. A maintenance provision for slow closing the switch to check switch blade engagement and slow opening the switch to check operation of the arc interrupting contacts

2.04 BUS

A. All phase bus conductors shall be *[tin-plated copper] [silver-plated copper].

B. Ground bus shall be silver-plated copper and be directly fastened to an unplated metal surface of each vertical section, and be of a size sufficient to carry the rated (2-second) current of the switchgear assembly.

C. A neutral bus shall be provided only when indicated on the drawings. It shall be insulated for 1000 Vac to ground. The current rating of the neutral bus shall be 600 amperes.

2.05 BUS INSULATION SYSTEM

A. All bus shall be supported utilizing a high strength and high creep support providing 10.5-inch of creep distance between phases and ground. The molded fins shall be constructed of high track resistant polyester.

B. All standoff insulators on switches and fuse mountings shall be *[glass polyester] [cycloaliphatic epoxy]

2.06 WIRING/TERMINATIONS

A. One (1) terminal pad per phase shall be provided for attaching contractor-supplied cable terminal lugs for a maximum of two (2) conductors per phase of the sizes indicated on the drawings. Sufficient space shall be allowed for contractor supplied electrical stress relief termination devices.

B. Small wiring, fuse blocks and terminal blocks within the vertical section shall be furnished as indicated on the drawings. Each control wire shall be labeled with wire markers. Terminal blocks shall be provided for owner's connections to other apparatus.

2.07 FUSES

A. Fault protection shall be provided by fuses with continuous ratings as shown in the contract documents. Any fuse/switch integrated momentary and fault close ratings specified shall have been verified by test and UL and CSA certified.

2.08 UTILITY METERING

2.09 ACCESSORIES

A. Supply key interlocks as shown on the drawings.

B. Furnish distribution class surge arresters with ratings in accordance with manufacture's recommendations.

2.10 ENCL OSURES

A. Enclosures shall be constructed per IEEE/ANSI C37.20.3. It shall be designed such that it can be installed indoor or outdoor.

B. Switchgear enclosure shall provide protection against internal arcing faults at the front, sides, and rear as defined by accessibility Type 2B under ANSI test guide C37.20.2.

C. In the event of an internal arcing fault, the resulting arc pressure and the exhaust shall be directed upward and into the plenum fitted above each section.

The switchgear shall be installed outdoor. An enclosed arc exhaust plenum shall be furnished for installation above the switchgear. Arc exhaust shall be vented from the arc-plenum to the exit location via arc-duct as shown on the drawings. Arc duct shall be supplied by *[the switchgear manufacturer][Purchaser]. When supplied by Purchaser, it must be made and installed in accordance with basic minimum design requirements provided by the switchgear manufacturer. Field assembly of the arc-plenum and arc-duct shall be by installing contractor. A minimum of one (1) 250-watt, 120-volt space heater shall be provided in each vertical section. Power for the space heater(s) shall be furnished □[as indicated on the drawings] [by a control power transformer mounted in the switchgear] [by a transformer mounted within the low voltage switchboard/switchgear].

2.11 NAMEPLATES

A. A nameplate shall be mounted on the front door of each switch vertical section in accordance with the drawings.

2.12 FINISH

A. Prior to assembly, all enclosing steel shall be thoroughly cleaned and phosphatized. A powder coating shall be applied electrostatically, then fused-on by baking in an oven. The coating is to have a thickness of not less than 1.5 mils. The finish shall have the following properties:

Impact resistance (ASTM D-2794)	60 direct/60 indirect
Pencil hardness (ASTM D-3363)	H
Flexibility (ASTM D-522)	Pass 1/8-inch mandrel
Salt spray (ASTM B117-85 [20])	600 hours
Color	ANSI 61 gray

2.13 SPECIAL SWITCHGEAR CONFIGURATIONS

A. Duplex Switchgear Assembly

1. Furnish, where shown on the drawings, a duplex switchgear assembly configuration consisting of two (2) load interrupter switches with common load side bus to feed one load circuit, which shall be fused or unfused as indicated on the drawings. Key interlocks shall be supplied to prevent paralleling the incoming sources, and to prevent opening the front door of each vertical section containing one of the two switches unless both switches are locked open

PART 2B PRODUCTS – TRANSFORMERS

2.01 MANUFACTURERS

A. Eaton

B. General Electric

C. Siemens

The listing of specific manufacturers above does not imply acceptance of their products that do not meet the specified ratings, features and functions. Manufacturers listed above are not relieved from meeting these specifications in their entirety. Products in compliance with the specification and manufactured by others not named will be considered only if pre-approved by the Engineer ten (10) days prior to bid date.

2.02 RATINGS

A. The ratings of the transformer shall be as follows or as shown on the drawings:

kVA Rating	1500/1725 ONAN/Future ONAF	
Impedance	5.75% +/- 7-1/2% Standard Tolerance	
HV	15.0kV Delta	
HV BIL	95kV	
HV De-energized Taps	4_____	+/- 2 - 2-1/2% full capacity
LV	277/480VoltsWye	
LV BIL	95kV	

2.03 CONSTRUCTION

A. The unit shall be biodegradable electrical insulating fluid from high oleic vegetable oil sources filled and shall be in accordance with the latest edition of the NEC. High fire point fluids shall be Factory Mutual and UL listed.

B. The transformer shall carry its continuous rating with average winding temperature rise by resistance that shall not exceed 65 degrees C, based on an average ambient of 30 degrees C over 24 hours with a maximum of 40 degrees C.

C. The transformer shall be designed to carry short-time emergency overloads in accordance with ANSI C57.12.92 as applicable. Duration and magnitude of designed withstand capability shall be as outlined in ANSI C57.12.90 and the latest draft of the IEEE short-circuit test code.

D. The transformer shall be designed to meet the sound level standards for liquid transformers as defined in NEMA TR1. The measurement procedure shall be as specified in ANSI C.57.12.90.

E. High-voltage and low-voltage windings shall be copper. Insulation between layers of the windings shall be by Insuldur paper or equal.

F. The main transformer tank and attached components shall be designed to withstand pressures 25% greater than the required operating design value without permanent deformation. Construction shall consist of carbon steel plate reinforced with external sidewall braces. All seams and joints shall be continuously welded.

G. Each radiator assembly shall be individually weldedand receive a quality control pressurized check for leaks. The entire tank assembly shall receive a similar leak test before core and coil are tanked. A final six-hour leak test shall be performed after the transformer is tanked, welded and completed to ensure that there are no leaks before shipment.

2.04 ACCESSORIES

A. Transformer features and accessories shall include:

1. De-energized tap changer with externally operated,padlockablehandle
2. Combination drain and filter valve and sampling device
3. Manual gas pressure test connection
4. Filling plug and filter press connection in cover
5. Dial-type top liquid thermometer
6. Magnetic liquid level gauge
7. Provisions for lifting, provisions for jacking, base designed for skidding or rolling in two directions
8. Ground pad – stainless steel
9. Instruction nameplate aluminum
10. Pressure vacuum gauge
11. Welded-on main tank cover and handhole in cover
12. Pressure relief device

2.05 FINISH

A. The paint shall be applied using an air spray with air dry acrylic topcoat system to a minimum of three mils average thickness. Outdoor liquid transformer units shall include

suitable outdoor paint finish. Units shall be painted ANSI 61 for indoor service or outdoor service and shall match the primary and secondary equipment.

2.06 TERMINAL COMPARTMENTS/FLANGE CONNECTIONS

A. The transformer unit supplied shall include a HV close-coupled flange and a LV close-coupled flange. Connections between the primary device and transformer shall be cable and between the transformer and secondary shall be flexible bus braid.

PART 2 C PRODUCTS – SECONDARY EQUIPMENT

2.01 MANUFACTURERS

A. Eaton

B. General Electric

C. Siemens

The listing of specific manufacturers above does not imply acceptance of their products that do not meet the specified ratings, features and functions. Manufacturers listed above are not relieved from meeting these specifications in their entirety. Products in compliance with the specification and manufactured by others not named will be considered only if pre-approved by the Engineer ten (10) days prior to bid date.

2.02 RATINGS

A. Voltage rating shall be as indicated on the drawings. The entire assembly shall be suitable for 600 volts maximum ac service.

B. The assembly shall be rated to withstand mechanical forces exerted during short-circuit conditions when connected directly to a power source having available fault current of 65,000 amperes symmetrical at rated voltage.

C. The bus system shall have a minimum ANSI short-circuit withstand rating of 100,000 amperes symmetrical tested in accordance with ANSI C37.20.1 and UL1558.

D. All circuit breakers shall have a minimum symmetrical interrupting capacity of 65,000 amperes. To ensure a fully selective system, all circuit breakers shall have 30 cycle short-time withstand ratings equal to their symmetrical interrupting ratings through 85,000 amperes, regardless of whether equipped with instantaneous trip protection or not.

E. All ratings shall be tested to the requirements of ANSI C37.20.1, C37.50 and C37.51 and UL witnessed and approved.

2.03 CONSTRUCTION

A. The switchgear shall consist of the required number of vertical sections bolted together to form a rigid assembly. The sides shall be covered with removable bolt-on covers. All edges of front covers or hinged front panels shall be formed. Provide ventilators located on the top of the switchgear over the breaker and bus compartments to ensure adequate ventilation within the enclosure. Hinged rear doors, complete with provisions for padlocking, shall be provided.

B. The assembly shall be provided with adequate lifting means and shall be capable of being moved into installation position and bolted directly to Provisions shall be made for jacking of shipping groups, for removal of skids or insertion of equipment rollers. Base of assembly shall be suitable for rolling directly on pipes without skids. The base shall be equipped with slots in the base frame members to accommodate the use of pry bars for moving the equipment to its final position.

C. Each vertical steel unit forming part of the switchgear line-up shall be a self-contained housing having one or more individual breaker or instrument compartments, a centralized bus compartment and a rear cable compartment. Each individual circuit breaker compartment, or cell, shall be segregated from adjacent compartments and sections by means of steel barriers to the maximum extent possible. It shall be equipped with drawout rails and primary and secondary disconnecting contacts. Removable hinge pins shall be provided on the breaker compartment door hinges. Current transformers for feeder instrumentation, where shown on the plans, shall be located within the appropriate breaker cells and be front accessible and removable.

D. The stationary part of the primary disconnecting devices for each power circuit breaker shall be breaker mounted and consist of a set of contacts extending to the rear through a glass polyester insulating support barrier; corresponding moving finger contacts, suitably spaced, shall be furnished on the power circuit breaker studs which engage in only the connected position. The assembly shall provide multiple silver-to-silver full floating high pressure point contacts with uniform pressure on each finger maintained by springs. Each circuit shall include the necessary three-phase bus connections between the section bus and the breaker line side studs. Load studs shall be equipped with insulated copper load extension buses terminating in solderless type terminals in the rear cable compartment of each structure. Bus extensions shall be silver-platedwhere outgoing terminals are attached.

E. The circuit breaker door design shall be such that the following functions may be performed without the need to open the circuit breaker door: lever circuit breaker between positions, operate manual charging system, close and open circuit breaker, examine and adjust trip unit, and read circuit breaker rating nameplate.

F. The secondary disconnecting devices shall consist of floating terminals mounted on the stationary unit and engaging mating contacts at the front of the breaker. The secondary disconnecting devices shall be gold-plated and engagement shall be maintained in the “connected” and “test” positions.

G. The removable power circuit breaker element shall be equipped with disconnecting contacts and interlocks for drawout application. It shall have four positions, “connected,” “test,” “disconnected” and “removed.” The breaker drawout element shall contain a worm gear

levering “in” and “out” mechanism with removable lever crank. Levering shall be accomplished via the use of conventional tools. Mechanical interlocking shall be provided so that the breaker is in the tripped position before levering “in” or “out” of the cell. Interlocking that trips the breaker will not be accepted. The breaker shall include an optional provision for key locking open to prevent manual or electric closing. Padlocking shall provide for securing the breaker in the connected, test, or disconnected position by preventing levering.

H. An insulating flash shield shall be mounted above each circuit breaker to prevent flashover from the arc chutes to ground.

I. The switchgear shall be Cutler-Hammer Magnum DS low voltage metal-enclosed switchgear, utilizing Magnum DS power circuit breakers as herein specified.

J. The switchgear shall be suitable for use as service entrance equipment and be labeled in accordance with UL requirements.

K. Provide a rear compartment barrier between the cable compartment and the main bus to protect against inadvertent contact with main or vertical bus bars.

L. Provide in the cell when the circuit breaker is withdrawn, a safety shutter which automatically covers the line and load stabs and protects against incidental contact.

2.04 BUS

A. All bus bars shall be silver-plated copper. Main horizontal bus bars shall be mounted with all three phases arranged in the same vertical plane. Bus sizing shall be based on ANSI standard temperature rise criteria of 65 degrees C over a 40 degrees C ambient (outside the enclosure).

B. Provide a full capacity neutral bus where a neutral bus is indicated on the drawings.

C. A copper ground bus shall be furnished firmly secured to each vertical section structure and shall extend the entire length of the switchgear. The ground bus short-time withstand rating shall meet that of the largest circuit breaker within the assembly.

D. All hardware used on conductors shall be high-tensile strength and zinc-plated. All bus joints shall be provided with Belleville-type washers.

2.05 WIRING/TERMINATIONS

A. Small wiring, necessary fuse blocks and terminal blocks within the switchgear shall be furnished as required. Control components mounted within the assembly shall be suitably marked for identification corresponding to the appropriate designations on manufacturer’s wiring diagrams.

B. Provide a front accessible, isolated vertical wireway for routing of factory and field wiring. Factory provisions shall be made for securing field wiring without the need for adhesive wire anchors.

C. Front access to all circuit breaker secondary connection points shall be provided for ease of troubleshooting and connection to external field connections without the need of removing the circuit breaker for access.

D. All control wire shall be type SIS. Control wiring shall be 16 ga for control circuits and 14 ga for current transformer circuits. Wire bundles shall be secured with nylon ties and anchored to the assembly with the use of pre-punched wire lances or nylon non-adhesive anchors. All current transformer secondary leads shall first be connected to conveniently accessible shorting terminal blocks before connecting to any other device. Shorting screws with provisions for storage shall be provided. All groups of control wires leaving the switchgear shall be provided with terminal blocks with suitable numbering strips and provisions for #10 AWG field connections. Each control wire shall be marked to the origin zone/wire name/destination zone over the entire length of the wire using a cured ink process. [3][Provide wire markers at each end of all control wiring]. Plug-in terminal blocks shall be provided for all shipping split wires. Terminal connections to remote devices or sources shall be front accessible via doors above each circuit breaker.

E. NEMA 2-hole mechanical-type lugs shall be provided for all line and load terminations suitable for copper or aluminum cable rated for 75 degrees C of the size indicated on the drawings.

F. Lugs shall be provided in the incoming line section for connection of the main grounding conductor. Additional lugs for connection of other grounding conductors shall be provided as indicated on the drawings.

G. Reusable insulating boots shall be provided to cover all power cable terminations.

2.06 CIRCUIT BREAKERS

A. All protective devices shall be low voltage power circuit breakers, Cutler-Hammer type Magnum DS or approved equal. All breakers shall be UL listed for application in their intended enclosures for 100% of their continuous ampere rating.

B. All power circuit breakers shall be constructed and tested in accordance with ANSI C37.13, C37.16, C37.17, C37.50, UL 1066 and NEMA SG-3 standard. The breaker shall carry a UL label.

C. Breakers shall be provided in drawout configuration. The 800, 1600, 2000 and 3200 ampere frame power circuit breakers shall be provided in the same physical frame size, while 4000, 5000 and 6000 ampere frame power circuit breakers shall be provided in a second physical frame size. Both physical frame sizes shall have a common height and depth.

D. Power circuit breakers shall utilize a two-step stored-energy mechanism to charge the closing springs. The closing of the breaker contacts shall automatically charge the opening springs to ensure quick-break operation.

E. Breakers shall be manually operated (MO) unless electrically operated (EO) is indicated on the drawings.

F. To facilitate lifting, the power circuit breaker shall have integral handles on the side of the breaker.

G. The power circuit breaker shall have a closing time of not more than 3 cycles.

H. The primary contacts shall have an easily accessible wear indicator to indicate contact erosion.

I. The power circuit breaker shall have three windows in the front cover to clearly indicate any electrical accessories that are mounted in the breaker. The accessory shall have a label that will indicate its function and voltage. The accessories shall be plug and lock type and UL listed for easy field installation. They shall be modular in design and shall be common to all frame sizes and ratings.

J. The breaker control interface shall have color-coded visual indicators to indicate contact open or closed positions, as well as mechanism charged and discharged positions. Manual control pushbuttons on the breaker face shall be provided for opening and closing the breaker. The power circuit breaker shall have a “Positive On” feature. The breaker flag will read “Closed” if the contacts are welded and the breaker is tripped or opened.

K. The current sensors shall have a back cover window that will permit viewing the sensor rating on the back of the breaker. A rating plug will offer indication of the rating on the front of the trip unit.

L. A position indicator shall be located on the faceplate of the breaker. This indicator shall provide color indication of the breaker position in the cell. These positions shall be Connect (Red), Test (Yellow), and Disconnect (Green). The levering door shall be interlocked so that when the breaker is in the closed position, the breaker levering-in door shall not open.

M. Each power circuit breaker shall offer sixty (60) front-mounted dedicated secondary wiring points. Each wiring point shall have finger safe contacts, which will accommodate #10 AWG maximum field connections with ring tongue or spade terminals or bare wire.

2.07 TRIP UNITS

A. Each low voltage power circuit breaker shall be equipped with a solid-state tripping system consisting of three current sensors, microprocessor-based trip device and flux-transfer shunt trip. Current sensors shall provide operation and signal function. The trip unit shall use microprocessor-based technology to provide the basic adjustable time-current protection functions. True rms sensing circuit protection shall be achieved by analyzing the secondary current signals received from the circuit breaker current sensors and initiating trip signals to the circuit breaker trip actuators when predetermined trip levels and time delay settings are reached. Interchangeable current sensors with their associated rating plug shall establish the continuous trip rating of each circuit breaker. The trip unit shall be Cutler-Hammer type Digitrip RMS 520.

B. The trip unit shall have an information system that utilizes battery backup LEDs to indicate mode of trip following an automatic trip operation. The indication of the mode of trip shall be retained after an automatic trip. A reset button shall be provided to turn off the LED

indication after an automatic trip. A test pushbutton shall energize a LED to indicate the battery status.

C. The trip unit shall be provided with a display panel, including a representation of the time/current curve that will indicate the protection functions. The unit shall be continuously self-checking and provide a visual indication that the internal circuitry is being monitored and is fully operational.

D. The trip unit shall be provided with a making-current release circuit. The circuit shall be armed for approximately two cycles after breaker closing and shall operate for all peak fault levels above 25 times the ampere value of the rating plug.

E. Trip unit shall have selectable powered and unpowered thermal memory for enhanced circuit protection.

F. Complete system selective coordination shall be provided by the addition of the following individually adjustable time/current curve shaping solid-state elements:

1. All circuit breakers shall have adjustments for long delay pickup and time
2. All circuit breakers shall have individual adjustments for short delay pickup and time, and include I^2t settings
3. All circuit breakers shall have an adjustable instantaneous pickup
4. All circuit breakers shall have individually adjustable ground fault current pickup and time, and include I^2t settings or ground alarm only

G. The trip unit shall have provisions for a single test kit to test each of the trip functions.

H. The trip unit shall provide zone interlocking for the short-time delay and ground fault delay trip functions for improved system coordination. The zone interlocking system shall restrain the tripping of an upstream breaker and allow the breaker closest to the fault to trip with no intentional time delay. In the event that the downstream breaker does not trip, the upstream breaker shall trip after the present time delay. The trip unit shall include a voltage transformer module, suitable for operation up to 600V, 50/60 Hz. The primary of the voltage transformer module shall be connected internally to the line side of the circuit breaker through a dielectric test disconnect plug.

I. System coordination shall be provided by the following microprocessor-based programmable time-current curve shaping adjustments. The short-time pickup adjustment shall be dependant on the long delay setting.

1. Programmable long-time setting
2. Programmable long-time delay with selectable I^2t or I^4t curve shaping
3. Programmable short-time setting
4. Programmable short-time delay with selectable flat or I^2t curve shaping, and zone selective interlocking
5. Programmable instantaneous setting
6. Programmable ground fault setting trip or ground fault setting alarm

7. Programmable ground fault delay with selectable flat or I^2t curve shaping and zone selective interlocking
8. Adjustable undervoltage release
9. Adjustable overvoltage release
10. Reverse load and fault current
11. Reverse sequence voltage alarm
12. Underfrequency
13. Overfrequency
14. Voltage phase unbalance and phase loss during current detection

J. Each section of the switchgear shall be provided with a space heater thermostatically controlled. Power for the space heaters shall be obtained from a source as indicated on the drawings. Supply voltage shall be 120 volts ac.

K. Fused control power transformers shall be provided as indicated on the drawings or as required for proper operation of the equipment. A manual disconnect shall be provided ahead of the primary fuses.

2.08 ENCLOSURES

A.

B. Outdoor Non-Walk-in Enclosure

1. Switchgear shall be enclosed in an outdoor non-walk-in NEMA 3R enclosure conforming to all applicable requirements of UL and designed to withstand wind velocities of 110mph. The enclosure shall have a roof sloping toward the rear. Outer sections shall be the same widths as indoor structures except the end sections of a non-walk-in enclosure shall be wider than the inner sections to permit opening the inner door. Each end of the outdoor structure shall have an end trim
2. The enclosure shall be provided with front and rear hinged padlockable doors with wind stops for each section. Steel floor plates shall be provided in the rear cable compartment. Ventilating openings shall be provided complete with replaceable fiberglass air filters which are removable from the exterior of the enclosure. Provide necessary space heaters thermostatically controlled for breaker, bus and cable compartments of adequate wattage to prevent the accumulation of moisture within the compartments
3. The construction of the enclosure shall be modular so future sections can be added without affecting NEMA 3R integrity. Provide interior fluorescent lights, switches and GFI protected receptacles
4. The enclosure shall be provided with undercoating applied to all members in contact with the foundation surface to retard corrosion
5. Power for the space heaters, lights and receptacles shall be obtained from a control power transformer within the switchgear. Supply voltage shall be 120 volts ac

6. A portable overhead circuit breaker lifter shall be provided to assist in removal of the circuit breakers from the enclosure
7. Each shipping section shall be shipped completely assembled

2.09 NAMEPLATES

A. Engraved nameplates, mounted on the face of the assembly, shall be furnished for all main and feeder circuits as indicated on the drawings. Nameplates shall be laminated plastic, black characters on white background, and secured with screws. Characters shall be 3/16-inch high, minimum.

B. Furnish master nameplate giving switchgear designation, voltage ampere rating, short-circuit rating, and manufacturer's name.

C. Control components mounted within the assembly, such as fuse blocks, relays, pushbuttons, switches, etc., shall be suitably marked for identification corresponding to appropriate designations on manufacturer's drawings.

2.10 FINISH

A. All exterior and interior steel surfaces of the switchgear shall be properly cleaned and provided with a rust-inhibiting phosphatized coating. Color and finish of the switchgear shall be ANSI 61.

2.11 SURGE PROTECTIVE DEVICES

A. Provide surge protective devices as specified in Section 16671A.

2.12 FACTORY TESTING

A. Standard factory tests shall be performed on the primary equipment provided under this section. All tests shall be in accordance with the latest version of ANSI and NEMA standards.

B. The following factory tests shall be made on all transformers. All tests shall be in accordance with the latest revision of ANSI and NEMA standards.

1. Resistance measurements of all windings on the rated voltage connection of each unit and at the tap extremes of one unit only of a given rating on this project
2. Ratio tests on the rated voltage connection and on all tap connections
3. Polarity and phase-relation tests on the rated voltage connections
4. No-load loss at rated voltage on the rated voltage connection
5. Exciting current at rated voltage on the rated voltage connection

6. Impedance and load loss at rated current on the rated voltage connection of each unit and on the tap extremes of one unit only of a given rating on this project
7. Applied potential test
8. Induced potential tests

C. The following standard factory tests shall be performed on the secondary equipment provided under this section. All tests shall be in accordance with the latest version of ANSI and NEMA standards.
   1. The switchgear shall be completely assembled, wired, adjusted and tested at the factory. After assembly, the complete switchgear shall be tested to ensure the accuracy of the wiring and the functioning of all equipment. The main bus system shall be given a dielectric test of 2200 volts for one minute between live parts and ground and between opposite polarities
   2. The wiring and control circuits shall be given a dielectric test of 1500 volts for one minute or 1800 volts for one second between live parts and ground, in accordance with ANSI C37.20.1

D. The manufacturer shall provide three (3) certified copies of factory test reports.
   1.

2.13 FIELD QUALITY CONTROL

A. Provide the services of a qualified factory-trained manufacturer's representative to assist the Contractor in installation and startup of the equipment specified under this section for a period of 7 working days. The manufacturer's representative shall provide technical direction and assistance to the contractor in general assembly of the equipment, connections and adjustments, and testing of the assembly and components contained herein.

B. The Contractor shall provide three (3) copies of the manufacturer's field startup report.

2.14 MANUFACTURER'S CERTIFICATION

A. A qualified factory-trained manufacturer's representative shall certify in writing that the equipment has been installed, adjusted and tested in accordance with the manufacturer's recommendations.

B. The Contractor shall provide three (3) copies of the manufacturer's representative's certification.

2.15 TRAINING

A. The Contractor shall provide a training session for up to five (5) owner's representatives for 1 normal workdays at a job site location determined by the owner.

B. The training session shall be conducted by a manufacturer's qualified representative. The training program shall include instructions on the assembly including primary equipment, transformer, and secondary equipment. All circuit breakers, protective devices and other major components shall be included.

2.16 INSTALLATION

A. The contractor shall install all equipment per the manufacturer’s recommendation and the contract drawings.

B. All necessary hardware to secure the assembly in place shall be provided by the contractor.

2.17 FIELD ADJUSTMENTS

2.18 FIELD TESTING

SECTION 26 22 00 - LOW-VOLTAGE TRANSFORMERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following types of dry-type transformers rated 600 V and less, with capacities up to 1000 kVA:

1. Distribution transformers.

B. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 MRc2: CONSTRUCTION WASTE MANAGEMENT

A. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 018113 Sustainable Design Requirements.

B. EQc4.1: LOW-EMITTING MATERIALS – SEALANTS AND ADHESIVES

All sealants, adhesives, and sealant primers used on the interior of the building shall comply with the project requirements for Low-Emitting Materials – Sealants and Adhesives. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

C. EQc4.2: LOW-EMITTING MATERIALS – PAINTS AND COATINGS

All paints and coatings used in the building interior comply with the project requirements for Low-Emitting Materials – Paints and Coatings. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

1.4 SUBMITTALS

A. Product Data: Include rated nameplate data, capacities, weights, dimensions, minimum clearances, installed devices and features, and performance for each type and size of transformer indicated.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

1. Wiring Diagrams: Power, signal, and control wiring.

C. Qualification Data: For testing agency.

D. Manufacturer Seismic Qualification Certification: Submit certification that transformers, accessories, and components will withstand seismic forces defined in Division 26 Section "Vibration and Seismic Controls for Electrical Systems." Include the following:

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified."

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

E. Source quality-control test reports.

F. Field quality-control test reports.

G. Operation and Maintenance Data: For transformers to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated, that is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7.

B. Source Limitations: Obtain each transformer type through one source from a single manufacturer.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

D. Comply with IEEE C57.12.91, "Test Code for Dry-Type Distribution and Power Transformers."

1.6 DELIVERY, STORAGE, AND HANDLING

A. Temporary Heating: Apply temporary heat according to manufacturer's written instructions within the enclosure of each ventilated-type unit, throughout periods during which equipment is not energized and when transformer is not in a space that is continuously under normal control of temperature and humidity.

1.7 COORDINATION

A. Coordinate size and location of concrete bases with actual transformer provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

B. Coordinate installation of wall-mounting and structure-hanging supports with actual transformer provided.

1.8 COMMISSIONING

A. The materials, components and systems described in this section are subject to the Commissioning process. Contractor must comply with all Commissioning Requirements. Commissioning Requirements are described in Section 019113 General Commissioning Requirements and in Division 36 Commissioning. Division 36 provides an individual Commissioning specification section for each Division 2 through Division 33 specification section requiring Commissioning.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. ACME Electric Corporation; Power Distribution Products Division.
2. Challenger Electrical Equipment Corp.; a division of Eaton Corp.
3. Controlled Power Company.
4. Eaton Electrical Inc.; Cutler-Hammer Products.
5. Federal Pacific Transformer Company; Division of Electro-Mechanical Corp.
6. General Electric Company.
7. Hammond Co.; Matra Electric, Inc.
8. Magnetek Power Electronics Group.
9. Micron Industries Corp.
10. Myers Power Products, Inc.
11. Siemens Energy & Automation, Inc.
12. Sola/Hevi-Duty.

2.2 GENERAL TRANSFORMER REQUIREMENTS

A. Description: Factory-assembled and -tested, air-cooled units for 60-Hz service.

B. Cores: Grain-oriented, non-aging silicon steel.

C. Coils: Continuous windings without splices except for taps.

1. Internal Coil Connections: Brazed or pressure type.
2. Coil Material: Copper.

2.3 DISTRIBUTION TRANSFORMERS

A. Comply with NEMA ST 20, and list and label as complying with UL 1561.

B. Provide transformers that are constructed to withstand seismic forces specified in Division 26 Section "Vibration and Seismic Controls for Electrical Systems."

C. Cores: One leg per phase.

D. Enclosure: Ventilate**d** NEMA 250, Type 2.

1. Core and coil shall be encapsulated within resin compound, sealing out moisture and air.

E. Transformer Enclosure Finish: Comply with NEMA 250.

1. Finish Color**:** Gray.

F. Taps for Transformers Smaller Than 3 kVA: None.

G. Taps for Transformers 7.5 to 24 kVA: One 5 percent tap above and one 5 percent tap below normal full capacity.

H. Taps for Transformers 25 kVA and Larger: Two 2.5 percent taps above and two 2.5 percent taps below normal full capacity.

I. Insulation Class: 220 deg C, UL-component-recognized insulation system with a maximum of 80 deg C rise above 40 deg C ambient temperature.

J. Energy Efficiency for Transformers Rated 15 kVA and Larger:

1. Complying with NEMA TP 1, Class 1 efficiency levels.
2. Tested according to NEMA TP 2.

K. K-Factor Rating: Transformers indicated to be K-factor rated shall comply with UL 1561 requirements for nonsinusoidal load current-handling capability to the degree defined by designated K-factor.

1. Unit shall not overheat when carrying full-load current with harmonic distortion corresponding to designated K-factor.
2. Indicate value of K-factor on transformer nameplate.

L. Wall Brackets: Manufacturer's standard brackets.

M. Low-Sound-Level Requirements: As per NEMA ST 20 standard sound levels when factory tested according to IEEE C57.12.91.

2.4 BUCK-BOOST TRANSFORMERS

A. Description: Self-cooled, two-winding dry type, rated for continuous duty and with wiring terminals suitable for connection as autotransformer. Transformers shall comply with NEMA ST 1 and shall be listed and labeled as complying with UL 506 or UL 1561.

B. Enclosure: Ventilated, NEMA 250, Type 2.

1. Finish Color: Gray.

2.5 IDENTIFICATION DEVICES

A. Nameplates: Engraved, laminated-plastic or metal nameplate for each distribution transformer, mounted with corrosion-resistant screws. Nameplates and label products are specified in Division 26 Section "Identification for Electrical Systems."

2.6 SOURCE QUALITY CONTROL

A. Test and inspect transformers according to IEEE C57.12.91.

B. Factory Sound-Level Tests: Conduct sound-level tests on equipment for this Project.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine conditions for compliance with enclosure- and ambient-temperature requirements for each transformer.

B. Verify that field measurements are as needed to maintain working clearances required by NFPA 70 and manufacturer's written instructions.

C. Examine walls, floors, roofs, and concrete bases for suitable mounting conditions where transformers will be installed.

D. Verify that ground connections are in place and requirements in Division 26 Section "Grounding and Bonding for Electrical Systems" have been met. Maximum ground resistance shall be 5 ohms at location of transformer.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install wall-mounting transformers level and plumb with wall brackets fabricated by transformer manufacturer.

1. Brace wall-mounting transformers as specified in Division 26 Section "Vibration and Seismic Controls for Electrical Systems.

B. Construct concrete bases and anchor floor-mounting transformers according to manufacturer's written instructions, seismic codes applicable to Project, and requirements in Division 26 Section "Vibration and Seismic Controls for Electrical Systems

3.3 CONNECTIONS

A. Ground equipment according to Division 26 Section "Grounding and Bonding for Electrical Systems."

B. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

3.4 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections and prepare test reports.

B. Perform tests and inspections and prepare test reports.

C. Tests and Inspections:

1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.

D. Remove and replace units that do not pass tests or inspections and retest as specified above.

E. Infrared Scanning:

1. Infrared Scanning: Perform the following infrared scan tests and inspections and prepare reports:

a. Infrared Scanning: After the date of acceptance, perform infrared scan of each transformer. Remove front and rear of transformer so joints and connections are accessible to portable scanner.

b. Follow-up infrared canning: perform an additional follow-up infrared scan of each transformer 11 months after date of Acceptance.

c. Record of infrared scanning: Prepare a certified report that identifies transformers are checked and that describes infrared-scanning results. Include notation of deficiencies detected, remedial action taken,and observations after remedial action.

d. Instruments and Equipment:

1) Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

F. Test Labeling: On completion of satisfactory testing of each unit, attach a dated and signed "Satisfactory Test" label to tested component.

3.5 ADJUSTING

A. Record transformer secondary voltage at each unit for at least 48 hours of typical occupancy period. Adjust transformer taps to provide optimum voltage conditions at secondary terminals. Optimum is defined as not exceeding nameplate voltage plus 10 percent and not being lower than nameplate voltage minus 3 percent at maximum load conditions. Submit recording and tap settings as test results.

B. Connect buck-boost transformers to provide nameplate voltage of equipment being served, plus or minus 5 percent, at secondary terminals.

C. Output Settings Report: Prepare a written report recording output voltages and tap settings.

3.6 CLEANING

A. Vacuum dirt and debris; do not use compressed air to assist in cleaning.

END OF SECTION 262200

SECTION 26 23 00 - METAL-ENCLOSED DRAWOUT SWITCHGEAR (MAGNUM DS) – LOW VOLTAGE

PART 1 GENERAL

1.1 SCOPE

A. The Contractor shall furnish and install, where indicated on the drawings, a deadfront type, low voltage metal-enclosed switchgear assembly utilizing Cutler-Hammer Magnum DS drawout power circuit breakers, as specified herein and shown on the contract drawings.

1.2 RELATED SECTIONS

A. Section 16671A – Transient Voltage Surge Suppression.

B. Section 16901 – Microprocessor-Based Metering Equipment.

C. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 REFERENCES

A. The low voltage metal-enclosed switchgear assembly and all components shall be designed, manufactured and tested in accordance with the following latest applicable standards:

1. ANSI-C37.20 – Switchgear assemblies
2. ANSI-C37.13 – Low voltage power circuit breakers
3. ANSI-C37.17 – Trip devices
4. NEMA SG-5 – Switchgear assemblies
5. NEMA SG-3 – Low voltage power circuit breakers
6. UL 1558

1.4 SUBMITTALS – FOR REVIEW/APPROVAL

A. The following information shall be submitted to the Engineer:

1. Master drawing index
2. Front view and plan view of the assembly
3. Three-line diagram
4. Schematic diagram
5. Nameplate schedule
6. Component list
7. Conduit space locations within the assembly

8. Assembly ratings including:
   a. Short-circuit rating
   b. Voltage
   c. Continuous current rating
9. Major component ratings including:
   a. Voltage
   b. Continuous current rating
   c. Interrupting ratings
10. Cable terminal sizes
11. Product data sheets

B. Where applicable, the following additional information shall be submitted to the Engineer:
1. Busway connection
2. Composite front view and plan view of close-coupled assemblies
3. Key interlock scheme drawing and sequence of operations
4. Mimic bus size and color

1.5 SUBMITTALS – FOR CONSTRUCTION

A. The following information shall be submitted for record purposes:
1. Final as-built drawings and information for items listed in Paragraph 1.04, and shall incorporate all changes made during the manufacturing process
2. Wiring diagrams
3. Certified production test reports
4. Installation information
5. Seismic certification as specified

1.6 QUALIFICATIONS

A. The manufacturer of the assembly shall be the manufacturer of the major components within the assembly.

B. For the equipment specified herein, the manufacturer shall be ISO 9001 or 9002 certified.

C. The manufacturer of this equipment shall have produced similar electrical equipment for a minimum period of five (5) years. When requested by the Engineer, an acceptable list of installations with similar equipment shall be provided demonstrating compliance with this requirement.

D. Provide Seismic tested equipment as follows:
1. The equipment and major components shall be suitable for and certified by actual seismic testing to meet all applicable seismic requirements of the latest International Building Code (IBC)
2. The Project Structural Engineer will provide site specific ground motion criteria for use by the manufacturer to establish SDS values required.
3. The IP rating of the equipment shall be 1.5

4. The Structural Engineer for the Site will evaluate the SDS values published on the Manufacturer's website to ascertain that they are "equal to" or "greater than" those required for the Project Site.
5. The following minimum mounting and installation guidelines shall be met, unless specifically modified by the above referenced standards.
   a. The Contractor shall provide equipment anchorage details, coordinated with the equipment mounting provision, prepared and stamped by a licensed civil engineer in the state. Mounting recommendations shall be provided by the manufacturer based upon the above criteria to verify the seismic design of the equipment.
   b. The equipment manufacturer shall certify that the equipment can withstand, that is, function following the seismic event, including both vertical and lateral required response spectra as specified in above codes.
   c. The equipment manufacturer shall document the requirements necessary for proper seismic mounting of the equipment. Seismic qualification shall be considered achieved when the capability of the equipment, meets or exceeds the specified response spectra.

1.7 WARRANTY.

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of surge suppressors that fails in materials or workmanship within specified warranty period.

1. Warranty Period: Two years from date of Substantial Completion.

1.8 REGULATORY REQUIREMENTS

A. The switchgear shall bear a UL 1558 label. Certified copies of production test reports shall be supplied demonstrating compliance with these standards.

1.9 DELIVERY, STORAGE AND HANDLING

A. Equipment shall be handled and stored in accordance with manufacturer's instructions. One (1) copy of these instructions shall be included with the equipment at time of shipment.

1.10 OPERATION AND MAINTENANCE MANUALS

A. Equipment operation and maintenance manuals shall be provided with each assembly shipped, and shall include instruction leaflets and instruction bulletins for the complete assembly and each major component.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Eaton

B. General Electric

C. Siemens

The listing of specific manufacturers above does not imply acceptance of their products that do not meet the specified ratings, features and functions. Manufacturers listed above are not relieved from meeting these

specifications in their entirety. Products in compliance with the specification and manufactured by others not named will be considered only if pre-approved by the Engineer ten (10) days prior to bid date.

2.2 RATINGS

A. Voltage rating shall be as indicated on the drawings. The entire assembly shall be suitable for 600 volts maximum ac service.

B. The assembly shall be rated to withstand mechanical forces exerted during short-circuit conditions when connected directly to a power source having available fault current of 65,000amperes symmetrical at rated voltage

C. The bus system shall have a minimum ANSI short-circuit withstand rating of 65,000 amperes symmetrical tested in accordance with ANSI C37.20.1 and UL1558.

D. All circuit breakers shall have a minimum symmetrical interrupting capacity of *[65,000 amperes. To ensure a fully selective system, all circuit breakers shall have 30 cycle short-time withstand ratings equal to their symmetrical interrupting ratings through 85,000 amperes, regardless of whether equipped with instantaneous trip protection or not.

E. All ratings shall be tested to the requirements of ANSI C37.20.1, C37.50 and C37.51 and UL witnessed and approved.

2.3 CONSTRUCTION

A. The switchgear shall consist of the required number of vertical sections bolted together to form a rigid assembly. The sides shall be covered with removable bolt-on covers. All edges of front covers or hinged front panels shall be formed. Provide ventilators located on the top of the switchgear over the breaker and bus compartments to ensure adequate ventilation within the enclosure. The rear covers shall be fabricated in two (2) pieces for ease of handling and shall be mounted using captive hardware.

B. The assembly shall be provided with adequate lifting means and shall be capable of being moved into installation position and bolted directly to *[Contractor supplied floor sills to be set level in concrete per manufacturer's recommendations] [the floor without the use of floor sills providing the floor is level to 1/8 inch per 3-foot distance in any direction. Provisions shall be made for jacking of shipping groups, for removal of skids or insertion of equipment rollers. Base of assembly shall be suitable for rolling directly on pipes without skids. The base shall be equipped with slots in the base frame members to accommodate the use of pry bars for moving the equipment to its final position.

C. Each vertical steel unit forming part of the switchgear line-up shall be a self-contained housing having one or more individual breaker or instrument compartments, a centralized bus compartment and a rear cable compartment. Each individual circuit breaker compartment, or cell, shall be segregated from adjacent compartments and sections by means of steel barriers to the maximum extent possible. It shall be equipped with drawout rails and primary and secondary disconnecting contacts. Removable hinge pins shall be provided on the breaker compartment door hinges. Current transformers for feeder instrumentation, where shown on the plans, shall be located within the appropriate breaker cells and be front accessible and removable.

D. The stationary part of the primary disconnecting devices for each power circuit breaker shall be breaker mounted and consist of a set of contacts extending to the rear through a glass polyester insulating support barrier; corresponding moving finger contacts, suitably spaced, shall be furnished on the power circuit breaker studs which engage in only the connected position. The assembly shall

provide multiple silver-to-silver full floating high pressure point contacts with uniform pressure on each finger maintained by springs. Each circuit shall include the necessary three-phase bus connections between the section bus and the breaker line side studs. Load studs shall be equipped with insulated copper load extension buses terminating in solderless type terminals in the rear cable compartment of each structure. Bus extensions shall be tin-platedwhere outgoing terminals are attached.

E. The circuit breaker door design shall be such that the following functions may be performed without the need to open the circuit breaker door: lever circuit breaker between positions, operate manual charging system, close and open circuit breaker, examine and adjust trip unit, and read circuit breaker rating nameplate.

F. The secondary disconnecting devices shall consist of floating terminals mounted on the stationary unit and engaging mating contacts at the front of the breaker. The secondary disconnecting devices shall be gold-plated and engagement shall be maintained in the “connected” and “test” positions.

G. The removable power circuit breaker element shall be equipped with disconnecting contacts and interlocks for drawout application. It shall have four positions, “connected,” “test,” “disconnected” and “removed.” The breaker drawout element shall contain a worm gear levering “in” and “out” mechanism with removable lever crank. Levering shall be accomplished via the use of conventional tools. Mechanical interlocking shall be provided so that the breaker is in the tripped position before levering “in” or “out” of the cell. Interlocking that trips the breaker will not be accepted. The breaker shall include an optional provision for key locking open to prevent manual or electric closing. Padlocking shall provide for securing the breaker in the connected, test, or disconnected position by preventing levering.

H. An insulating flash shield shall be mounted above each circuit breaker to prevent flashover from the arc chutes to ground.

I. The switchgear shall be Cutler-Hammer Magnum DS low voltage metal-enclosed switchgear, utilizing Magnum DS power circuit breakers as herein specified.

J. The switchgear shall be suitable for use as service entrance equipment and be labeled in accordance with UL requirements.

K. Provide a rear compartment barrier between the cable compartment and the main bus to protect against inadvertent contact with main or vertical bus bars.

L. Provide in the cell when the circuit breaker is withdrawn, a safety shutter which automatically covers the line and load stabs and protects against incidental contact.

M. Provide a metal barrier full height and depth between adjacent vertical structures in the cable compartment.

N. Provide a glass polyester full height and depth barrier between adjacent vertical structures in the bus compartment with appropriate slots for main bus.

2.4 BUS

A. All bus bars shall be tin-plated copper. Main horizontal bus bars shall be mounted with all three phases arranged in the same vertical plane. Bus sizing shall be based on ANSI standard temperature rise criteria of 65 degrees C over a 40 degrees C ambient (outside the enclosure).

B. Provide a full capacity neutral bus where a neutral bus is indicated on the drawings.

C. A copper ground bus shall be furnished firmly secured to each vertical section structure and shall extend the entire length of the switchgear. The ground bus short-time withstand rating shall meet that of the largest circuit breaker within the assembly.

D. All hardware used on conductors shall be high-tensile strength and zinc-plated. All bus joints shall be provided with Belleville-type washers.

2.5 WIRING/TERMINATIONS

A. Small wiring, necessary fuse blocks and terminal blocks within the switchgear shall be furnished as required. Control components mounted within the assembly shall be suitably marked for identification corresponding to the appropriate designations on manufacturer's wiring diagrams.

B. Provide a front accessible, isolated vertical wireway for routing of factory and field wiring. Factory provisions shall be made for securing field wiring without the need for adhesive wire anchors.

C. Front access to all circuit breaker secondary connection points shall be provided for ease of troubleshooting and connection to external field connections without the need of removing the circuit breaker for access.

D. All control wire shall be type SIS. Control wiring shall be 14 ga for control circuits and 12 gafor current transformer circuits. Wire bundles shall be secured with nylon ties and anchored to the assembly with the use of pre-punched wire lances or nylon non-adhesive anchors. All current transformer secondary leads shall first be connected to conveniently accessible shorting terminal blocks before connecting to any other device. Shorting screws with provisions for storage shall be provided. All groups of control wires leaving the switchgear shall be provided with terminal blocks with suitable numbering strips and provisions for #10 AWG field connections. Each control wire shall be marked to the origin zone/wire name/destination zone over the entire length of the wire using a cured ink process. Provide wire markers at each end of all control wiring. Plug-in terminal blocks shall be provided for all shipping split wires. Terminal connections to remote devices or sources shall be front accessible via doors above each circuit breaker.

E. NEMA 2-hole crimp- type lugs shall be provided for all line and load terminations suitable for copper or aluminum cable rated for 75 degrees C of the size indicated on the drawings.

F. Lugs shall be provided in the incoming line section for connection of the main grounding conductor. Additional lugs for connection of other grounding conductors shall be provided as indicated on the drawings.

G. Reusable insulating boots shall be provided to cover all power cable terminations.

2.6 CIRCUIT BREAKERS

A. All protective devices shall be low voltage power circuit breakers, Cutler-Hammer type Magnum DS or approved equal. All breakers shall be UL listed for application in their intended enclosures for 100% of their continuous ampere rating.

B. All power circuit breakers shall be constructed and tested in accordance with ANSI C37.13, C37.16, C37.17, C37.50, UL 1066 and NEMA SG-3 standard. The breaker shall carry a UL label.

C. Breakers shall be provided in drawout configuration. The 800, 1600, 2000 and 3200 ampere frame power circuit breakers shall be provided in the same physical frame size, while 4000, 5000 and 6000 ampere frame power circuit breakers shall be provided in a second physical frame size. Both physical frame sizes shall have a common height and depth.

D. Power circuit breakers shall utilize a two-step stored-energy mechanism to charge the closing springs. The closing of the breaker contacts shall automatically charge the opening springs to ensure quick-break operation.

E. Breakers shall be manually operated (MO) unless electrically operated (EO) is indicated on the drawings.

F. Electrically operated breakers shall be complete with 120 Vac motor operators. The charging time of the motor shall not exceed 6 seconds.

G. To facilitate lifting, the power circuit breaker shall have integral handles on the side of the breaker.

H. The power circuit breaker shall have a closing time of not more than 3 cycles.

I. The primary contacts shall have an easily accessible wear indicator to indicate contact erosion.

J. The power circuit breaker shall have three windows in the front cover to clearly indicate any electrical accessories that are mounted in the breaker. The accessory shall have a label that will indicate its function and voltage. The accessories shall be plug and lock type and UL listed for easy field installation. They shall be modular in design and shall be common to all frame sizes and ratings.

K. The breaker control interface shall have color-coded visual indicators to indicate contact open or closed positions, as well as mechanism charged and discharged positions. Manual control pushbuttons on the breaker face shall be provided for opening and closing the breaker. The power circuit breaker shall have a “Positive On” feature. The breaker flag will read “Closed” if the contacts are welded and the breaker is tripped or opened.

L. The current sensors shall have a back cover window that will permit viewing the sensor rating on the back of the breaker. A rating plug will offer indication of the rating on the front of the trip unit.

M. A position indicator shall be located on the faceplate of the breaker. This indicator shall provide color indication of the breaker position in the cell. These positions shall be Connect (Red), Test (Yellow), and Disconnect (Green). The levering door shall be interlocked so that when the breaker is in the closed position, the breaker levering-in door shall not open.

N. Each power circuit breaker shall offer sixty (60) front-mounted dedicated secondary wiring points. Each wiring point shall have finger safe contacts, which will accommodate #10 AWG maximum field connections with ring tongue or spade terminals or bare wire.

2.7 TRIP UNITS

A. Each low voltage power circuit breaker shall be equipped with a solid-state tripping system consisting of three current sensors, microprocessor-based trip device and flux-transfer shunt trip. Current sensors shall provide operation and signal function. The trip unit shall use microprocessor-based technology to provide the basic adjustable time-current protection functions. True rms sensing circuit protection shall be achieved by analyzing the secondary current signals received from the circuit breaker current sensors and initiating trip signals to the circuit breaker trip actuators when predetermined trip levels and time delay settings are reached. Interchangeable current sensors with their associated rating plug shall establish the continuous trip rating of each circuit breaker. The trip unit shall be Cutler-Hammer type Digitrip RMS 520M.

B. The trip unit shall have an information system that utilizes battery backup LEDs to indicate mode of trip following an automatic trip operation. The indication of the mode of trip shall be retained after an

automatic trip. A reset button shall be provided to turn off the LED indication after an automatic trip. A test pushbutton shall energize a LED to indicate the battery status.

C. The trip unit shall be provided with a display panel, including a representation of the time/current curve that will indicate the protection functions. The unit shall be continuously self-checking and provide a visual indication that the internal circuitry is being monitored and is fully operational.

D. The trip unit shall be provided with a making-current release circuit. The circuit shall be armed for approximately two cycles after breaker closing and shall operate for all peak fault levels above 25 times the ampere value of the rating plug.

E. Trip unit shall have selectable powered and unpowered thermal memory for enhanced circuit protection.

F. Complete system selective coordination shall be provided by the addition of the following individually adjustable time/current curve shaping solid-state elements:

1. All circuit breakers shall have adjustments for long delay pickup and time
2. All circuit breakers shall have individual adjustments for short delay pickup and time, and include I^2t settings
3. All circuit breakers shall have an adjustable instantaneous pickup
4. All circuit breakers shall have individually adjustable ground fault current pickup and time, and include I^2t settings or ground alarm only

G. The trip unit shall have provisions for a single test kit to test each of the trip functions.

H. The trip unit shall provide zone interlocking for the short-time delay and ground fault delay trip functions for improved system coordination. The zone interlocking system shall restrain the tripping of an upstream breaker and allow the breaker closest to the fault to trip with no intentional time delay. In the event that the downstream breaker does not trip, the upstream breaker shall trip after the present time delay

I. Main Circuit breakers, where indicated on the drawings, shall have individually adjustable ground fault alarm only.

J. The trip unit shall have a 4-character LCD display showing phase, neutral, and ground current. The accuracy of these readings shall be +/- 2% of full scale.

K. The trip unit shall include a power/relay module which shall supply control to the readout display. Following an automatic trip operation of the circuit breaker, the trip unit shall maintain the cause of trip history and the mode of trip LED indication as long as its internal power supply is available. An internal relay shall be programmable to provide contacts for remote ground alarm indication.

L. The trip unit shall include a voltage transformer module, suitable for operation up to 600V, 50/60 Hz. The primary of the voltage transformer module shall be connected internally to the line side of the circuit breaker through a dielectric test disconnect plug.

2.8 MISCELLANEOUS DEVICES

A. Key interlocks shall be provided as indicated on the drawings. These interlocks shall keep the circuit breakers trip-free when actuated.

B. Each section of the switchgear shall be provided with a space heater thermostatically controlled. Power for the space heaters shall be obtained from a control power transformer within the switchgear. Supply voltage shall be 120 volts ac.

C. Fused control power transformers shall be provided as indicated on the drawings or as required for proper operation of the equipment. A manual disconnect shall be provided ahead of the primary fuses.

2.9 OWNER METERING

A. Where indicated on the drawings, provide a separate owner metering compartment with front hinged door.

B. Provide current transformers for each meter. Current transformers shall be wired to shorting-type terminal blocks.

C. Provide potential transformers including primary and secondary fuses with disconnecting means for metering as shown on the drawings.

D. Microprocessor-Based Metering System.

2.10 ENCLOSURES

A. NEMA 1 Enclosure

2.11 NAMEPLATES

A. Engraved nameplates, mounted on the face of the assembly, shall be furnished for all main and feeder circuits as indicated on the drawings. Nameplates shall be laminated plastic, black characters on white background, and secured with screws. Characters shall be 3/16-inch high, minimum.

B. Furnish master nameplate giving switchgear designation, voltage ampere rating, short-circuit rating, and manufacturer’s name.

C. Control components mounted within the assembly, such as fuse blocks, relays, pushbuttons, switches, etc., shall be suitably marked for identification corresponding to appropriate designations on manufacturer’s drawings.

2.12 FINISH

A. All exterior and interior steel surfaces of the switchgear shall be properly cleaned and provided with a rust-inhibiting phosphatized coating. Color and finish of the switchgear shall be ANSI 61.

2.13 ACCESSORIES

A. Provide a floor running portable circuit breaker transfer truck with manual lifting mechanism.

2.14 SURGE PROTECTIVE DEVICES

A. Provide surge protective devices as specified in Section 16671A.

PART 3 EXECUTION

3.1 FACTORY TESTING

A. The switchgear shall be completely assembled, wired, adjusted and tested at the factory. After assembly, the complete switchgear shall be tested to ensure the accuracy of the wiring and the functioning of all equipment. The main bus system shall be given a dielectric test of 2200 volts for one minute between live parts and ground and between opposite polarities.

B. The wiring and control circuits shall be given a dielectric test of 1500 volts for one minute, or 1800 volts for one second, between live parts and ground, in accordance with ANSI C37.20.1.

C. A certified test report of all standard production tests shall be shipped with each assembly.

3.2 FIELD QUALITY CONTROL

A. Provide the services of a qualified factory-trained manufacturer's representative to provide start-up of the equipment specified under this section for a period of 2 working days.

B. Acceptance Testing Preparation:

1. Test insulation resistance for each switchgear bus, component, connecting supply, feeder, and control circuit.
2. Test continuity of each circuit.

C. Tests and Inspections:

1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
3. Perform the following infrared scan tests and inspections and prepare reports:

a. Infrared Scanning: After the date of acceptance, perform infrared scan of the each switchgear. Remove front of panels so joints and connections are accessible to portable scanner.

b. Follow-up infrared canning: perform an additional follow-up infrared scan of the each switchgear 11 months after date of Acceptance.

c. Record of infrared scanning: Prepare a certified report that identifies switchgear is checked and that describes infrared-scanning results. Include notation of deficiencies detected, remedial action taken and observations after remedial action.

d. Instruments and Equipment:

1) Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

B. The Contractor shall provide three (3) copies of the manufacturer's field startup report.

3.3 TRAINING

A. The Contractor shall provide a training session for up to five (5) owner's representatives for 2 normal workdays at a job site location determined by the owner.

B. The training session shall be conducted by a manufacturer's qualified representative. The training program shall consist of the instruction on the operation of the assembly, circuit breakers, and major components within the assembly.

3.4 INSTALLATION

A. The Contractors shall install all equipment per the manufacturer's recommendations and the contract drawings.

B. All necessary hardware to secure the assembly in place shall be provided by the Contractor.

C. The equipment shall be installed and checked in accordance with the manufacturer's recommendations. This shall include but not limited to:

1. Checking to ensure that the pad location is level to within 0.125 inches per three feet of distance in any direction
2. Checking to ensure that all bus bars are torqued to the manufacturer's recommendations
3. Assembling all shipping sections, removing all shipping braces and connecting all shipping split mechanical and electrical connections
4. Securing assemblies to foundation or floor channels
5. Measuring and recording Megger readings phase-to-phase, phase-to-ground, and neutral-to-ground (four wire systems only)
6. Inspecting and installing all circuit breakers in their proper compartments

END OF SECTION 26 23 00

SECTION 26 23 14 – INTERIOR MEDIUM VOLTAGE METAL ENCLOSED SWITCHGEAR

PART 1 GENERAL

1.1 SCOPE

A. The Contractor shall furnish and install the (2) new medium voltage load interrupter switchgear cubicles as specified herein and as shown on the contract drawings. The new cubicles are to be connected to the existing Powercon switchgear. In addition to the installation of the new cubicles, the contractor shall test and repair the existing Powercon switchgear.

1.2 RELATED SECTIONS

A. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 REFERENCES

A. The medium voltage load interrupter switchgear and all components shall be designed, manufactured and tested in accordance with the latest applicable standards as follows:

1. ANSI/IEEE C37.20.3
2. ANSI/IEEE C37.20.4
3. ANSI C37.22
4. ANSI C37.57, C37.58
5. NEMA SG5
6. NEMA SG6
7. CSA 22.2 No.31-M89 (5/15 kV ratings only)
8. EEMAC G8-3.3

B. Listing by Underwriters Laboratories (UL) or Canadian Standards Association (CSA) shall be provided for 5 kV or 15 kV class medium voltage load interrupter switchgear.

1.4 SUBMITTALS – FOR REVIEW/APPROVAL

A. The following information shall be submitted to the Engineer and BGE for their approval:

1. Master drawing index

2. Front view elevation
3. Floor plan
4. Top view
5. Single line
6. Nameplate schedule
7. Component list
8. Conduit entry/exit locations
9. Assembly ratings including:
    a. Short-circuit rating
    b. Voltage
    c. Continuous current
    d. Basic Impulse Level
10. Major component ratings including:
    a. Voltage
    b. Continuous current
    c. Interrupting ratings
11. Cable terminal sizes

A. Where applicable or required by the Engineer the following additional information shall be submitted to the Engineer:

12. Bus duct connection
13. Connection details between close-coupled assemblies
14. Composite floor plan of close-coupled assemblies
15. Electrical schematic diagram
16. Key interlock scheme drawing and sequence of operations
17. Descriptive bulletins
18. Product data sheets

1.5 SUBMITTALS – FOR CONSTRUCTION

A. The following information shall be submitted for record purposes:

1. Final as-built drawings and information for items listed in Paragraph 1.04, and shall incorporate all changes made during the manufacturing process
2. Wiring diagrams
3. Certified production test reports
4. Installation information including equipment anchorage provisions
5. Seismic certification as specified

1.6 QUALIFICATIONS

A. The manufacturer of the assembly shall be Powercon.

B. For the equipment specified herein, the manufacturer shall be ISO 9001 or 9002 certified.

1.7 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of surge suppressors that fails in materials or workmanship within specified warranty period.

1. Warranty Period: Two years from date of Substantial Completion.

1.8 DELIVERY, STORAGE AND HANDLING

A. Equipment shall be handled and stored in accordance with manufacturer's instructions. One (1) copy of these instructions shall be included with the equipment at time of shipment.

B. Each switchgear assembly shall be split into shipping groups for handling as indicated on the drawings or per the manufacturer's recommendations. Shipping groups shall be designed to be shipped by truck, rail or ship. Shipping groups shall be bolted to skids. Accessories shall be packaged and shipped separately. Each switchgear shipping group shall be equipped with lifting eyes for handling solely by crane.

1.9 OPERATION AND MAINTENANCE MANUALS

A. Equipment operation and maintenance manuals shall be provided with each assembly shipped, and shall include instruction leaflets and instruction bulletins for the complete assembly and each major component.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Powercon (To match existing)

2.2 RATINGS (shall match existing switchgear)

A. Switchgear assembly ratings shall be as follows:

1.	Nominal System Voltage	15 kV three-phase three wire
2.	System Grounding	solid

3. Main Cross Bus Continuous Current — Match existing as determined by manufacture

1. Maximum Design Voltage — 15 kV
2. BIL — 95kV
3. Main Cross Bus Momentary Current (10 Cycle) — 101kA Asymmetrical RMS
4. Main Cross Bus 2-Second Short Circuit Current — 63 kA Symmetrical RMS

5. Non-Fused Switch (Continuous and Load Break) — 600 Amperes
6. Non-Fused Momentary withstand — 64 kA Asym RMS
7. Non-Fused Switch Fault close (3 times minimum, for 4.76 & 15 kV) — 61 kA Asymmetrical
8. Non-Fused Switch 2-Second Short Circuit Current — 38 kA Sym RMS

9. Fuse Rating — 100 Ampere
10. Type of Fuse — CLE
11. Fuse Interrupting Rating — 63 kA Sym RMS
12. Fused Switch Fault close — 101 kA Asym RMS

2.3 15 KV CONSTRUCTION

A. The metal-enclosed load interrupter switchgear shall consist of deadfront, completely metal-enclosed vertical sections containing load interrupter switches and fuses (where shown) of the number, rating and type noted on the drawings or specified herein.

B. The following features shall be supplied on every vertical section containing a three-pole, two-position open-closed switch:

1. A minimum 8-inch x 16-inch high-impact viewing window that permits full view of the position of all three switch blades through the closed door. The window shall not be more than 58-inches above the switch pad level to allow ease of inspection
2. The door shall be interlocked with the switch so that:
   a. The switch must be opened before the door can be opened.
   b. The door must be closed before the switch can be closed.
3. A hinged grounded metal barrier that is bolted closed in front of every switch to prevent inadvertent contact with any live part, yet allows for a full-view inspection of the switch blade position
4. Provision for padlocking the switch in the open or closed position
5. Green OPEN, Red CLOSED switch position indicators with the words “Open” and “Closed” in French, Spanish and English

6. A hinged cover with rustproof quarter turn nylon latches over the switch operating mechanism to discourage casual tampering

7. The switch shall be removable from the structure as a complete operational component

C. Vertical section construction shall be of the universal frame type using die-formed and bolted parts. All enclosing covers and doors shall be fabricated from steel with thickness equal to or greater than that specified in ANSI/IEEE C37.20.3. No owner removable hardware for covers or doors shall be thread-forming type. To facilitate installation and maintenance of cables and bus in each vertical section, a split removable top cover and padlockable hinged rear door held closed by bolts shall be provided. A G90 grade galvanized base shall isolate equipment from contact with the concrete pad providing protection from rust. Heavy-duty hot dipped galvanized anchor clips shall be provided to anchor the switchgear to the concrete pad.

D. Each vertical section containing a switch shall have a single, full-length, flanged front door and shall be equipped with two (2) rotary latch-type padlockable handles. Provision shall be made for operating the switch and storing the removable handle without opening the full length door.

E. Each load interrupter switch shall have the following features:

1. Three-pole gang-operated mechanism

2. Manual quick-make, quick-break over-toggle-type mechanism that does not require the use of a chain or a cable for operation, and utilizes a heavy-duty coil spring to provide opening and closing energy

3. The speed of opening and closing the switch shall be independent of the operator, and it shall be impossible to tease the switch into any intermediate position under normal operation

4. Separate main and break contacts to provide maximum endurance for fault close and load interrupting duty

5. Insulating barriers between each phase and between the outer phases and the enclosure

2.4 A MAINTENANCE PROVISION FOR SLOW CLOSING THE SWITCH TO CHECK SWITCH BLADE ENGAGEMENT AND SLOW OPENING THE SWITCH TO CHECK OPERATION OF THE ARC INTERRUPTING CONTACTS BUS

A. All phase bus conductors shall be tin-plated copper.

B. Ground bus shall be silver-plated copper and be directly fastened to a galvanized metal surface of each vertical section, and be of a size sufficient to carry the rated (2-second) current of the switchgear assembly.

C. A neutral bus shall be provided only when indicated on the drawings. It shall be insulated for 1000 Vac to ground. The current rating of the neutral bus shall be 600 amperes.

2.5 BUS INSULATION SYSTEM

A. All bus shall be supported utilizing a high strength and high creep support providing 10.5-inch of creep distance between phases and ground. The molded fins shall be constructed of high track resistant cycloaliphatic epoxy.

B. All standoff insulators on switches and fuse mountings shall be glass polyester (for 5kV and 15kV class switchgear).

2.6 WIRING/TERMINATIONS

A. One (1) terminal pad per phase shall be provided for attaching contractor-supplied cable terminal lugs for a maximum of two (2) conductors per phase of the sizes indicated on the drawings. Sufficient space shall be allowed for contractor supplied electrical stress relief termination devices.

B. Small wiring, fuse blocks and terminal blocks within the vertical section shall be furnished as indicated on the drawings. Each control wire shall be labeled with wire markers. Terminal blocks shall be provided for owner's connections to other apparatus.

2.7 FUSES

A. Fault protection shall be provided by fuses with continuous ratings as shown in the contract documents. Any fuse/switch integrated momentary and fault close ratings specified shall have been verified by test and UL and CSA certified.

2.9 ACCESSORIES

A. Supply key interlocks as shown on the drawings.

B. Furnish distribution class surge arresters with ratings in accordance with manufacture's recommendations.

C. (1) Set of spare 15KV fuses.

D. Digital electrical power monitor mounted on the front of each cubicle. Power monitor shall include all necessary PTs and CTs.

E. Portal in each new and existing door for infrared viewing.

2.11 ENCLOSURES

A. Enclosures shall be constructed per IEEE/ANSI C37.20.3 Outdoor specifications. (Exceeds NEMA 3R.)

B. Each vertical section shall have a sloped weatherproof roof with labyrinth shaped joints. Use of gasket or caulking to make roof joints weatherproof shall not be permitted. All exterior openings shall be screened to prevent the entrance of small animals and barriered to inhibit the entrance of snow, sand, etc. A minimum of one (1) 250-watt, 120-volt space heater shall be provided in each vertical section. Power for the space heater(s) shall be furnished by a control power transformer mounted in the switchgear. The design shall be non-walk-in type.

C. Each vertical section shall be ventilated at the top and bottom, both front and rear, to allow airflow to provide cooling and help prevent buildup of moisture within the structure. The ventilated covers shall be externally removable to allow safe maintenance of the filter media without providing access to live parts.

D. Enclosure shall be Dust Resistant. All ventilated openings shall be filtered to inhibit the ingress of dust. The ventilated covers shall be externally removable to allow safe maintenance of the filter media without providing access to live parts. All external doors and covers shall be gasketed.

2.12 NAMEPLATES

A. A nameplate shall be mounted on the front door of each switch vertical section in accordance with the drawings.

2.13 FINISH

A. Prior to assembly, all enclosing steel shall be thoroughly cleaned and phosphatized. A powder coating shall be applied electrostatically, then fused-on by baking in an oven. The coating is to have a thickness of not less than 1.5 mils. The finish shall have the following properties:

Impact resistance (ASTM D-2794)	60 direct/60 indirect
Pencil hardness (ASTM D-3363)	H
Flexibility (ASTM D-522)	Pass 1/8-inch mandrel
Salt spray (ASTM B117-85 [20])	600 hours
Color	ANSI 61 gray

2.15 REPAIRS TO EXISTING SWITCHGEAR

A. The contractor performing the repairs to the existing 15KV switchgear shall have NICET or NETA certified technician on site. The testing company shall be responsible to schedule all outages with BGE for all the gear to be tested and repaired. A full test in accordance with NETA standards shall be performed. The automatic transfer scheme shall be fully tested. The control switch handle that failed to operate the main switch shall be fully repaired.

2.16 BGE COORDINATION

A. Contractor shall send shop drawings of new cubicles including time current curves for the installed fuses to BGE for review and their approval.

PART 3 – EXECUTION

3.1 FACTORY TESTING

A. Standard factory tests shall be performed on the equipment under this section. All tests shall be in accordance with the latest version of ANSI and NEMA standards.

B. Factory tests as outlined above shall be witnessed by the owner's representative.

1. The manufacturer shall notify the owner two (2) weeks prior to the date the tests are to be performed

2. The manufacturer shall provide three (3) certified copies of factory test reports.

3.2 FIELD QUALITY CONTROL

A. Provide the services of a qualified factory-trained manufacturer's representative to assist the Contractor in installation and startup of the equipment specified under this section for a period of 2 working days. The manufacturer's representative shall provide technical direction and assistance to the Contractor in general assembly of the equipment, connections and adjustments, and testing of the assembly and components contained therein.

B. The Contractor shall provide three (3) copies of the manufacturer's field startup report.

3.3 MANUFACTURER'S CERTIFICATION

A. The Contractor shall provide a qualified factory-trained manufacturer's representative shall certify in writing that the equipment has been installed, adjusted and tested in accordance with the manufacturer's recommendations.

B. The Contractor shall provide three (3) copies of the manufacturer's representative's certification.

3.4 TRAINING

A. The Contractor shall provide a training session for up to five (5) owner's representatives for 2 normal workdays at a job site location determined by the owner.

B. The training session shall be conducted by a manufacturer's qualified representative and consist of instruction on the assembly, switches and major components.

3.5 INSTALLATION

A. The Contractors shall install all equipment per the manufacturer's recommendations and the contract drawings.

B. All necessary hardware to secure the assembly in place shall be provided by the Contractor.

3.6 FIELD TESTING

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Acceptance Testing Preparation:

1. Test insulation resistance for each switchgear bus, component, connecting supply, feeder, and control circuit.
2. Test continuity of each circuit.

C. Tests and Inspections:

1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
3. Perform the following infrared scan tests and inspections and prepare reports:

a. Infrared Scanning: After the date of acceptance, perform infrared scan of each switchgear Remove front of switchgear so joints and connections are accessible to portable scanner.

b. Follow-up infrared canning: perform an additional follow-up infrared scan of each switchgear 11 months after date of Acceptance.

c. Record of infrared scanning: Prepare a certified report that identifies switchgear is checked and that describes infrared-scanning results. Include notation of deficiencies detected, remedial action taken,and observations after remedial action.
d. Instruments and Equipment:

1) Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

D. Swichgear will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports, including a certified report that identifies switchgear included and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

END OF SECTION 26 23 13

SECTION 26 24 16 - PANELBOARDS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Distribution panelboards.
2. Lighting and appliance branch-circuit panelboards.
3. Load centers.
4. Electronic-grade panelboards.

B. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 DEFINITIONS

A. SVR: Suppressed voltage rating.

B. TVSS: Transient voltage surge suppressor.

1.4 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Panelboards shall withstand the effects of earthquake motions determined according to SEI/ASCE 7.

1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

1.5 MRc2: CONSTRUCTION WASTE MANAGEMENT

A. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 018113 Sustainable Design Requirements.

B. EQc4.1: LOW-EMITTING MATERIALS – SEALANTS AND ADHESIVES

All sealants, adhesives, and sealant primers used on the interior of the building shall comply with the project requirements for Low-Emitting Materials – Sealants and Adhesives. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

C. EQc4.2: LOW-EMITTING MATERIALS – PAINTS AND COATINGS

All paints and coatings used in the building interior comply with the project requirements for Low-Emitting Materials – Paints and Coatings. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

1.6 SUBMITTALS

A. Product Data: For each type of panelboard, switching and overcurrent protective device, transient voltage suppression device, accessory, and component indicated. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, and finishes.

B. Shop Drawings: For each panelboard and related equipment.

1. Include dimensioned plans, elevations, sections, and details. Show tabulations of installed devices, equipment features, and ratings.
2. Detail enclosure types and details for types other than NEMA 250, Type 1.
3. Detail bus configuration, current, and voltage ratings.
4. Short-circuit current rating of panelboards and overcurrent protective devices.
5. Include evidence of NRTL listing for series rating of installed devices.
6. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
7. Include wiring diagrams for power, signal, and control wiring.
8. Include time-current coordination curves for each type and rating of overcurrent protective device included in panelboards. Submit on translucent log-log graft paper; include selectable ranges for each type of overcurrent protective device.

C. Qualification Data: For qualified testing agency.

D. Seismic Qualification Certificates: Submit certification that panelboards, overcurrent protective devices, accessories, and components will withstand seismic forces defined in Division 26 Section "Vibration and Seismic Controls for Electrical Systems." Include the following:

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

E. Field Quality-Control Reports:

1. Test procedures used.
2. Test results that comply with requirements.
3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.

F. Panelboard Schedules: For installation in panelboards. Submit final versions after load balancing**.**

G. Operation and Maintenance Data: For panelboards and components to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include the following:

1. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
2. Time-current curves, including selectable ranges for each type of overcurrent protective device that allows adjustments.

1.7 QUALITY ASSURANCE

A. Testing Agency Qualifications: Member company of NETA or an NRTL.

1. Testing Agency's Field Supervisor: Currently certified by NETA to supervise on-site testing.

B. Source Limitations: Obtain panelboards, overcurrent protective devices, components, and accessories from single source from single manufacturer.

C. Product Selection for Restricted Space: Drawings indicate maximum dimensions for panelboards including clearances between panelboards and adjacent surfaces and other items. Comply with indicated maximum dimensions.

D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

E. Comply with NEMA PB 1.

F. Comply with NFPA 70.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Remove loose packing and flammable materials from inside panelboards; install temporary electric heating (250 W per panelboard) to prevent condensation.

B. Handle and prepare panelboards for installation according to NEMA PB 1.

1.9 PROJECT CONDITIONS

A. Environmental Limitations:

1. Do not deliver or install panelboards until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above panelboards is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
2. Rate equipment for continuous operation under the following conditions unless otherwise indicated:

B. Service Conditions: NEMA PB 1, usual service conditions, as follows:

1. Ambient temperatures within limits specified.
2. Altitude not exceeding 6600 feet.Retain paragraph below if interruption of existing electric service is required.

1.10 COORDINATION

C. Coordinate layout and installation of panelboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

D. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

1.11 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace transient voltage suppression devices that fail in materials or workmanship within specified warranty period.

1. Warranty Period: Five years from date of Substantial Completion.

1.12 EXTRA MATERIALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Keys: Two spares for each type of panelboard cabinet lock.
2. Circuit Breakers Including GFCI and Ground Fault Equipment Protection (GFEP) Types: Two spares for each panelboard.

1.13 WARRANTY

A. Warranty Period: Two years from date of Substantial Completion.

1.14 COMMISSIONING

A. The materials, components and systems described in this section are subject to the Commissioning process. Contractor must comply with all Commissioning Requirements. Commissioning Requirements are described in Section 019113 General Commissioning Requirements and in Division 36 Commissioning. Division 36 provides an individual Commissioning specification section for each Division 2 through Division 33 specification section requiring Commissioning.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS FOR PANELBOARDS

A. Fabricate and test panelboards according to IEEE 344 to withstand seismic forces defined in Division 26 Section "Vibration and Seismic Controls for Electrical Systems."

B. Enclosures: Flush- and surface-mounted cabinets.

1. Rated for environmental conditions at installed location.

a. Indoor Dry and Clean Locations: NEMA 250, Type 1
b. Kitchen or Wash-Down Areas: NEMA 250, Type 4X, stainless steel.
c. Other Wet or Damp Indoor Locations: NEMA 250, Type 4 .

2. Hinged Front Cover: Entire front trim hinged to box and with standard door within hinged trim cover.
3. Finishes:

a. Panels and Trim: Steel factory finished immediately after cleaning and pretreating with manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat.
b. Back Boxes: Galvanized steel, Same finish as panels and trim.

4. Directory Card: Inside panelboard door, mounted in transparent card holder.

C. Incoming Mains Location: Top and bottom.

D. Phase, Neutral, and Ground Buses:

1. Material: Hard-drawn copper, 98 percent conductivity.
2. Equipment Ground Bus: Adequate for feeder and branch-circuit equipment grounding conductors; bonded to box.
3. Isolated Ground Bus: Adequate for branch-circuit isolated ground conductors; insulated from box.
4. Extra-Capacity Neutral Bus: Neutral bus rated 200 percent of phase bus and UL listed as suitable for nonlinear loads.
5. Split Bus: Vertical buses divided into individual vertical sections.

E. Conductor Connectors: Suitable for use with conductor material and sizes.

1. Material: Hard-drawn copper, 98 percent conductivity.
2. Main and Neutral Lugs: Mechanical type.
3. Ground Lugs and Bus-Configured Terminators: Mechanical type.

4. Feed-Through Lugs: Mechanical type, suitable for use with conductor material. Locate at opposite end of bus from incoming lugs or main device.
5. Subfeed (Double) Lugs: Mechanical type suitable for use with conductor material. Locate at same end of bus as incoming lugs or main device.
6. Gutter-Tap Lugs: Mechanical type suitable for use with conductor material. Locate at same end of bus as incoming lugs or main device.
7. Extra-Capacity Neutral Lugs: Rated 200 percent of phase lugs mounted on extra-capacity neutral bus.

F. Service Equipment Label: NRTL labeled for use as service equipment for panelboards or load centers with one or more main service disconnecting and overcurrent protective devices.

G. Future Devices: Mounting brackets, bus connections, filler plates, and necessary appurtenances required for future installation of devices.

H. Panelboard Short-Circuit Current Rating: Rated for series-connected system with integral or remote upstream overcurrent protective devices and labeled by an NRTL. Include size and type of allowable upstream and branch devices, listed and labeled for series-connected short-circuit rating by an NRTL.

I. Panelboard Short-Circuit Current Rating: Fully rated to interrupt symmetrical short-circuit current available at terminals.

2.2 DISTRIBUTION PANELBOARDS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following.

1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
3. Siemens Energy & Automation, Inc.
4. Square D; a brand of Schneider Electric.

B. Panelboards: NEMA PB 1, power and feeder distribution type.

C. Doors: Secured with vault-type latch with tumbler lock; keyed alike.

1. For doors more than 36 inches high, provide two latches, keyed alike.

D. Mains: Circuit breaker/Lugs only.

E. Branch Overcurrent Protective Devices for Circuit-Breaker Frame Sizes 125 A and Smaller: Bolt-on circuit breakers.

F. Branch Overcurrent Protective Devices for Circuit-Breaker Frame Sizes Larger Than 125 A: Bolt-on circuit breakers; plug-in circuit breakers where individual positive-locking device requires mechanical release for removal.

G. Contactors in Main Bus: NEMA ICS 2, Class A, electrically or mechanically held, general-purpose controller, with same short-circuit interrupting rating as panelboard.

1. Internal Control-Power Source: Control-power transformer, with fused primary and secondary terminals, connected to main bus ahead of contactor connection.

2.3 LIGHTING AND APPLIANCE BRANCH-CIRCUIT PANELBOARDS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
3. Siemens Energy & Automation, Inc.
4. Square D; a brand of Schneider Electric.

B. Panelboards: NEMA PB 1, lighting and appliance branch-circuit type.

C. Mains: Circuit breaker or lugs only.

D. Branch Overcurrent Protective Devices: Bolt-on circuit breakers, replaceable without disturbing adjacent units.

E. Contactors in Main Bus: NEMA ICS 2, Class A, electrically or mechanically held, general-purpose controller, with same short-circuit interrupting rating as panelboard.

1. Internal Control-Power Source: Control-power transformer, with fused primary and secondary terminals, connected to main bus ahead of contactor connection.

F. Doors: Concealed hinges; secured with flush latch with tumbler lock; keyed alike.

G. Column-Type Panelboards: Narrow gutter extension, with cover, to overhead junction box equipped with ground and neutral terminal buses.

2.4 DISCONNECTING AND OVERCURRENT PROTECTIVE DEVICES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following.

1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
3. Siemens Energy & Automation, Inc.
4. Square D; a brand of Schneider Electric.

B. Molded-Case Circuit Breaker (MCCB): Comply with UL 489, with series-connected rating or interrupting capacity to meet available fault currents.

1. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads, and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
2. Adjustable Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
3. Electronic trip circuit breakers with rms sensing; field-replaceable rating plug or field-replicable electronic trip; and the following field-adjustable settings:

a. Instantaneous trip.
b. Long- and short-time pickup levels.
c. Long- and short-time time adjustments.
d. Ground-fault pickup level, time delay, and I^2t response.

4. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller; let-through ratings less than NEMA FU 1, RK-5.
5. GFCI Circuit Breakers: Single- and two-pole configurations with Class A ground-fault protection (6-mA trip).
6. Ground-Fault Equipment Protection (GFEP) Circuit Breakers: Class B ground-fault protection (30-mA trip).
7. Arc-Fault Circuit Interrupter (AFCI) Circuit Breakers: Comply with UL 1699; 120/240-V, single-pole configuration.
8. Molded-Case Circuit-Breaker (MCCB) Features and Accessories:

    a. Standard frame sizes, trip ratings, and number of poles.
    b. Lugs: *Mechanical* style, suitable for number, size, trip ratings, and conductor materials.
    c. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge (HID) lighting circuits.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Receive, inspect, handle, and store panelboards according to NEMA PB 1.1.

B. Examine panelboards before installation. Reject panelboards that are damaged or rusted or have been subjected to water saturation.

C. Examine elements and surfaces to receive panelboards for compliance with installation tolerances and other conditions affecting performance of the Work.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install panelboards and accessories according to NEMA PB 1.1.

B. Equipment Mounting: Install panelboards on concrete bases, 4-inch nominal thickness. Comply with requirements for concrete base specified in Division 03 Section "Cast-in-Place Concrete."

1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around full perimeter of base.
2. For panelboards, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
4. Install anchor bolts to elevations required for proper attachment to panelboards.
5. Attach panelboard to the vertical finished or structural surface behind the panelboard.

C. Mount top of trim so the operating handle of top most circuit breaker is not higher than 79 inches above finished floor..

D. Comply with mounting and anchoring requirements specified in Division 26 Section "Vibration and Seismic Controls for Electrical Systems."

E. Mount panelboard cabinet plumb and rigid without distortion of box. Mount recessed panelboards with fronts uniformly flush with wall finish and mating with back box.

F. Install overcurrent protective devices and controllers not already factory installed.

1. Set field-adjustable, circuit-breaker trip ranges.

G. Install filler plates in unused spaces.

H. Arrange conductors in gutters into groups and bundle and wrap with wire ties after completing load balancing.

I. Comply with NECA 1.

3.3 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs complying with Division 26 Section "Identification for Electrical Systems."

B. Create a directory to indicate installed loads; incorporate Owner's final room designations. Use a computer or typewriter to create directory; handwritten directories are not acceptable.

C. Panelboard Nameplates: Label each panelboard with a nameplate complying with requirements for identification specified in Division 26 Section "Identification for Electrical Systems."

D. Device Nameplates: Label each branch circuit device in distribution panelboards with a nameplate complying with requirements for identification specified in Division 26 Section "Identification for Electrical Systems."

3.4 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Acceptance Testing Preparation:

1. Test insulation resistance for each panelboard bus, component, connecting supply, feeder, and control circuit.
2. Test continuity of each circuit.

C. Tests and Inspections:

1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
3. Perform the following infrared scan tests and inspections and prepare reports:

a. Infrared Scanning: After the date of acceptance, perform infrared scan of each panel board. Remove front of panels so joints and connections are accessible to portable scanner.

b. Follow-up infrared canning: perform an additional follow-up infrared scan of each panel board 11 months after date of Acceptance.

c. Record of infrared scanning: Prepare a certified report that identifies panel boards are checked and that describes infrared-scanning results. Include notation of deficiencies detected, remedial action taken,and observations after remedial action.

d. Instruments and Equipment:

1) Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

D. Panelboards will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports, including a certified report that identifies panelboards included and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.5 ADJUSTING

A. Adjust moving parts and operable component to function smoothly, and lubricate as recommended by manufacturer.

B. Set field-adjustable circuit-breaker trip ranges as specified in Division 26 Section "Overcurrent Protective Device Coordination Study.

3.6 PROTECTION

C. Temporary Heating: Apply temporary heat to maintain temperature according to manufacturer's written instructions.

END OF SECTION 262416

SECTION 26 25 24 – COORDINATION WITH DIVISION 28

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specifications Sections, apply to this Section.

1.2 SCOPE INCLUDES:

A. This section describes responsibilities of the division 26 electrical contractor relative to coordination with the division 28 security electronics contractor.

B. Work specific to the division 26 electrical scope is described in the division 26 specifications and on drawing sheets with the prefix “EG”, “EL”, “EP” and “ES”.

C. Work specific to the division 28 security electronics scope is described in the division 28 specifications and on drawing sheets with the prefix “TY”.

D. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

PART 2 -– PRODUCTS

2.1 Not used

PART 3 -– EXECUTION

3.1 Work provided under division 28

A. All electrical work associated with the security electronics systems including conduit, conduit bodies, back boxes, wire and cable, wiring devices, panel boards, and all appurtenances thereto are part of the division 26 scope of work; exceptions are as noted under item B below.

B. The interface between the electrical and security electronics scope of work is as follows:

1. Security system power distribution is the responsibility of the division 26 contractor. Conduit, wire, wiring devices and panel boards shall be provided under the division 26 scope of work. All material and workmanship will be as specified in the division 26 specifications. Power to all security control consoles, equipment cabinets, etc. is the responsibility of the division 26 contractor.

2. Elevator interface panels are provided under the division 28 scope of work. All conduit and wire associated with the security electronics control side of the interface is by division 26. Conduit and wire between the security electronics interface panel and the elevator equipment is by division 26.
3. Security lighting control interface requires the lighting distribution circuits to be routed through the relay cabinet. The distribution circuits, relays and locations controlled are described in the relay schedules on sheet E542 and see detail 2 sheet TY601. The division 26 electrical contractor is responsible for all conduit, wire, and fixtures etc. for the lighting circuits. The electrical contractor is responsible for providing the relay panels and control relays and integrating the control into the PLC/Bacnet.
4. Security receptacle control interface requires the power distribution circuits to be routed through the relays cabinet. The distribution circuits, relays and locations controlled are described in the relay schedules on sheet E542 and see detail 2 on sheet TY601. The division 26 electrical contractor is responsible for all conduit, and wire, for the receptacle circuits. The electrical contractor is responsible for providing the relay panels and control relays and integrating the control into the PLC/Bacnet.
5. The signal grounding system indicated on electrical and security drawings provided by the division 26 contractor. Conduit and wire required to connect the TMGB to the main electrical ground point is the responsibility of the division 26 contractor. Connection of the telecommunications rooms (MDF/IDF) ground buss bars to the signal grounding system is by the division 26 contractor.

END OF SECTION 262524

SECTION 26 27 26 - WIRING DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:

1. Receptacles, receptacles with integral GFCI, and associated device plates.
2. Twist-locking receptacles.
3. Receptacles with integral surge suppression units.
4. Wall-box motion sensors.
5. Isolated-ground receptacles.
6. Hospital-grade receptacles.
7. Snap switches and wall-box dimmers.
8. Solid-state fan speed controls.
9. Wall-switch and exterior occupancy sensors.
10. Communications outlets.
11. Pendant cord-connector devices.
12. Cord and plug sets.
13. Floor service outlets, poke-through assemblies, service poles, and multioutlet assemblies.

B. Related sections

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners

1.3 DEFINITIONS

A. EMI: Electromagnetic interference.

B. GFCI: Ground-fault circuit interrupter.

C. Pigtail: Short lead used to connect a device to a branch-circuit conductor.

D. RFI: Radio-frequency interference.

E. TVSS: Transient voltage surge suppressor.

F. UTP: Unshielded twisted pair.

1.4 MRc2: CONSTRUCTION WASTE MANAGEMENT

A. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 018113 Sustainable Design Requirements.

B. EQc4.1: LOW-EMITTING MATERIALS – SEALANTS AND ADHESIVES

All sealants, adhesives, and sealant primers used on the interior of the building shall comply with the project requirements for Low-Emitting Materials – Sealants and Adhesives. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

C. EQc4.2: LOW-EMITTING MATERIALS – PAINTS AND COATINGS

All paints and coatings used in the building interior comply with the project requirements for Low-Emitting Materials – Paints and Coatings. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

1.5 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: List of legends and description of materials and process used for premarking wall plates.

C. Field quality-control test reports.

D. Operation and Maintenance Data: For wiring devices to include in all manufacturers' packing label warnings and instruction manuals that include labeling conditions.

1.6 QUALITY ASSURANCE

A. Source Limitations: Obtain each type of wiring device and associated wall plate through one source from a single manufacturer. Insofar as they are available, obtain all wiring devices and associated wall plates from a single manufacturer and one source.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Comply with NFPA 70.

1.7 COORDINATION

A. Receptacles for Owner-Furnished Equipment: Match plug configurations.

1. Cord and Plug Sets: Match equipment requirements.

1.8 EXTRA MATERIALS

A. Furnish extra materials described in subparagraphs below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Floor Service Outlet Assemblies: One for every 10, but no fewer than one.
2. Poke-Through, Fire-Rated Closure Plugs: One for every 10 floor service outlets installed, but no fewer than one.

1.9 WARRANTY

A. Warranty Period: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following.

1. Cooper Wiring Devices; a division of Cooper Industries, Inc. (Cooper).
2. Hubbell Incorporated; Wiring Device-Kellems (Hubbell).
3. Leviton Mfg. Company Inc. (Leviton).
4. Pass & Seymour/Legrand; Wiring Devices & Accessories (Pass & Seymour).

2.2 STRAIGHT BLADE RECEPTACLES

A. All receptacles in inmate area shall be extra heavy duty institution grade and specification grade in other areas.

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Cooper
b. Hubbell
c. Leviton
d. Pass & Seymour

C. Convenience Receptacles, 125 V, 20 A: Comply with NEMA WD 1, NEMA WD 6 configuration 5-20R, and UL 498.

.

D. Hospital-Grade, Duplex Convenience Receptacles, 125 V, 20 A: Comply with NEMA WD 1, NEMA WD 6 configuration 5-20R, and UL 498 Supplement SD.

E. Isolated-Ground, Duplex Convenience Receptacles, 125 V, 20 A: Comply with NEMA WD 1, NEMA WD 6 configuration 5-20R, and UL 498.

1. Description: Straight blade; equipment grounding contacts shall be connected only to the green grounding screw terminal of the device and with inherent electrical isolation from mounting strap. Isolation shall be integral to receptacle construction and not dependent on removable parts.

F. Tamper-Resistant Convenience Receptacles, 125 V, 20 A: Comply with NEMA WD 1, NEMA WD 6 configuration 5-20R, and UL 498.

1. Description: Labeled to comply with NFPA 70, "Health Care Facilities" Article, "Pediatric Locations" Section.

2.3 GFCI RECEPTACLES

A. General Description: Straight blade, non-feed-through type. Comply with NEMA WD 1, NEMA WD 6, UL 498, and UL 943, Class A, and include indicator light that is lighted when device is tripped.

B. Duplex GFCI Convenience Receptacles, 125 V, 20 A:

C. Hospital-Grade, Duplex GFCI Convenience Receptacles, 125 V, 20 A: Comply with UL 498 Supplement SD.

.

2.4 TWIST-LOCKING RECEPTACLES

A. Single Convenience Receptacles, 125 V, 20 A: Comply with NEMA WD 1, NEMA WD 6 configuration L5-20R, and UL 498.

B. Isolated-Ground, Single Convenience Receptacles, 125 V, 20 A:

1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:

2. Description: Comply with NEMA WD 1, NEMA WD 6 configuration L5-20R, and UL 498. Equipment grounding contacts shall be connected only to the green grounding screw terminal of the device and with inherent electrical isolation from mounting strap. Isolation shall be integral to receptacle construction and not dependent on removable parts.

2.5 PENDANT CORD-CONNECTOR DEVICES

A. Description: Matching, locking-type plug and receptacle body connector; NEMA WD 6 configurations L5-20P and L5-20R, heavy-duty grade.

1. Body: Nylon with screw-open cable-gripping jaws and provision for attaching external cable grip.
2. External Cable Grip: Woven wire-mesh type made of high-strength galvanized-steel wire strand, matched to cable diameter, and with attachment provision designed for corresponding connector.

2.6 CORD AND PLUG SETS

A. Description: Match voltage and current ratings and number of conductors to requirements of equipment being connected.

1. Cord: Rubber-insulated, stranded-copper conductors, with Type SOW-A jacket; with green-insulated grounding conductor and equipment-rating ampacity plus a minimum of 30 percent.
2. Plug: Nylon body and integral cable-clamping jaws. Match cord and receptacle type for connection.

2.7 SNAP SWITCHES

A. Comply with NEMA WD 1 and UL 20.

B. All switches in inmate area shall be extra heavy duty institution grade and specification grade in other areas.

C. Manufacturers: Subject to compliance with requirements, provide products by one of the following.

1. Cooper Wiring Devices; a division of Cooper Industries, Inc. (Cooper).
2. Hubbell Incorporated; Wiring Device-Kellems (Hubbell).
3. Leviton Mfg. Company Inc. (Leviton).
4. Pass & Seymour/Legrand; Wiring Devices & Accessories (Pass & Seymour).

D. Switches, 120/277 V, 20 A rated.

E. Pilot Light Switches, 20 A rated:
   a. Description: Single pole, with neon-lighted handle, illuminated when switch is "ON."

F. Key-Operated Switches, 120/277 V, 20 A:

1. Description: Single pole, with factory-supplied key in lieu of switch handle.

G. Single-Pole, Double-Throw, Momentary Contact, Center-Off Switches, 120/277 V, 20 A; for use with mechanically held lighting contactors.

H. Key-Operated, Single-Pole, Double-Throw, Momentary Contact, Center-Off Switches, 120/277 V, 20 A; for use with mechanically held lighting contactors, with factory-supplied key in lieu of switch handle.

2.8 WALL-BOX DIMMERS

A. Dimmer Switches: Modular, full-wave, solid-state units with integral, quiet on-off switches, with audible frequency and EMI/RFI suppression filters.

B. Control: Continuously adjustable slider; with single-pole or three-way switching. Comply with UL 1472.

2.9 OCCUPANCY SENSORS

A. Wall-Switch Sensors:

1. Products: Subject to compliance with requirements, provide one of the following:

   a. Cooper;
   b. Hubbell;
   c. Leviton;
   d. Pass & Seymour;
   e. Watt Stopper (The);

2. Description: Passive-infrared type, 120/277 V, adjustable time delay up to 30 minutes, 180-degree field of view, with a minimum coverage area of 900 sq. ft.

B. Wall-Switch Sensors:

1. Available Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
2. Products: Subject to compliance with requirements, provide one of the following:
   a. Hubbell; AT120 for 120 V, AT277 for 277 V.
   b. Leviton; ODS 15-ID.

3. Description: Adaptive-technology type, 120/277 V, adjustable time delay up to 20 minutes, 180-degree field of view, with a minimum coverage area of 900 sq. ft..

C. Long-Range Wall-Switch Sensors:

1. Products: Subject to compliance with requirements, provide one of the following:

   a. Hubbell;
   b. Leviton
   c. Pass & Seymour;
   d. Watt Stopper (The);

2. Description: Passive-infrared type, 120/277 V, adjustable time delay up to 30 minutes, 110-degree field of view, with a minimum coverage area of 1200 sq. ft..

D. Long-Range Wall-Switch Sensors:

1. Description: Dual technology, with both passive-infrared- and ultrasonic-type sensing, 120/277 V, adjustable time delay up to 30 minutes, 110-degree field of view, and a minimum coverage area of 1200 sq. ft..

E. Wide-Range Wall-Switch Sensors:

1. Description: Passive-infrared type, 120/277 V, adjustable time delay up to 30 minutes, 150-degree field of view, with a minimum coverage area of 1200 sq. ft..

2.10 COMMUNICATIONS OUTLETS

A. Telephone Outlet:

1. Products: Subject to compliance with requirements, provide one of the following:
   a. Cooper;
   b. Leviton;.

2. Description: Single RJ-45 jack for terminating 100-ohm, balanced, four-pair UTP; TIA/EIA-568-B.1; complying with Category 5e. Comply with UL 1863.

B. Combination TV and Telephone Outlet:

1. Products: Subject to compliance with requirements, provide one of the following:
   a. Cooper
   b. Leviton;

2. Description: Single RJ-45 jack for 100-ohm, balanced, four-pair UTP; TIA/EIA-568-B.1; complying with Category 5e; and one Type F coaxial cable connector.

2.11 WALL PLATES

A. Single and combination types to match corresponding wiring devices.

1. Plate-Securing Screws: Metal with head color to match plate finish; 4 tamper proof screws for each plate for inmate areas.
2. Material for Finished Spaces: Steel with Ivory baked enamel painting. For inmate areas: Security wall plates 14 gage polyester powder finish cold rolled steel with 4 tamper proof T20 TORX screws .
3. Material for Unfinished Spaces: Galvanized steel.
4. Material for Damp Locations: Cast aluminum with spring-loaded lift cover, and listed and labeled for use in "wet locations."

B. Wet-Location, Weatherproof Cover Plates: NEMA 250, complying with type 3R weather-resistant , die-cast aluminum with lockable cover.

2.12 FLOOR SERVICE FITTINGS

A. Type: Modular, flush-type dual-service units suitable for wiring method used.

B. Compartments: Barrier separates power from voice and data communication cabling.

C. Power Receptacle: NEMA WD 6 configuration 5-20R, gray finish, unless otherwise indicated.

D. Voice and Data Communication Outlets.

2.13 POKE-THROUGH ASSEMBLIES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Hubbell Incorporated; Wiring Device-Kellems.
2. Pass & Seymour/Legrand; Wiring Devices & Accessories.
3. Square D/ Schneider Electric.
4. Thomas & Betts Corporation.
5. Wiremold Company (The).

B. Description: Factory-fabricated and -wired assembly of below-floor junction box with multichanneled, through-floor raceway/firestop unit and detachable matching floor service outlet assembly.

1. Service Outlet Assembly: Flush type .with two simplex receptacles and space for four RJ-45 jacks unless otherwise noted on drawings.
2. Fire Rating: Unit is listed and labeled for fire rating of floor-ceiling assembly.

2.14 MULTIOUTLET ASSEMBLIES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Hubbell Incorporated; Wiring Device-Kellems.
2. Wiremold Company (The).

B. Components of Assemblies: Products from a single manufacturer designed for use as a complete, matching assembly of raceways and receptacles.

C. Raceway Material: Metal, with manufacturer's standard finish.

D. Wire: No. 12 AWG.

2.15 SERVICE POLES

A. Description: Factory-assembled and -wired units to extend power and voice and data communication from distribution wiring concealed in ceiling to devices or outlets in pole near floor.

1. Poles: Nominal 2.5-inch- square cross section, with height adequate to extend from floor to at least 6 inches above ceiling, and with separate channels for power wiring and voice and data communication cabling.
2. Mounting: Ceiling trim flange with concealed bracing arranged for positive connection to ceiling supports; with pole foot and carpet pad attachment.
3. Wiring: Sized for minimum of five No. 12 AWG power and ground conductors and a minimum of four, 4-pair, Category 3 or 5 voice and data communication cables.

4. Power Receptacles: Two duplex, 20-A, heavy-duty, NEMA WD 6 configuration 5-20R units.

2.16 FINISHES

A. Color: Wiring device catalog numbers in Section Text do not designate device color.

1. Wiring Devices Connected to Normal Power System: Ivory and As selected by Architect unless otherwise indicated or required by NFPA 70 or device listing.
2. Wiring Devices Connected to Emergency Power System: Red.
3. TVSS Devices: Blue.
4. Isolated-Ground Receptacles: Orange or with orange triangle on face.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Comply with NECA 1, including the mounting heights listed in that standard, unless otherwise noted.

B. Coordination with Other Trades:

1. Take steps to insure that devices and their boxes are protected. Do not place wall finish materials over device boxes and do not cut holes for boxes with routers that are guided by riding against outside of the boxes.
2. Keep outlet boxes free of plaster, drywall joint compound, mortar, cement, concrete, dust, paint, and other material that may contaminate the raceway system, conductors, and cables.
3. Install device boxes in brick or block walls so that the cover plate does not cross a joint unless the joint is troweled flush with the face of the wall.
4. Install wiring devices after all wall preparation, including painting, is complete.

C. Conductors:

1. Do not strip insulation from conductors until just before they are spliced or terminated on devices.
2. Strip insulation evenly around the conductor using tools designed for the purpose. Avoid scoring or nicking of solid wire or cutting strands from stranded wire.
3. The length of free conductors at outlets for devices shall meet provisions of NFPA 70, Article 300, without pigtails.
4. Existing Conductors:

a. Cut back and pigtail, or replace all damaged conductors.
b. Straighten conductors that remain and remove corrosion and foreign matter.
c. Pigtailing existing conductors is permitted provided the outlet box is large enough.

D. Device Installation:

1. Replace all devices that have been in temporary use during construction or that show signs that they were installed before building finishing operations were complete.
2. Keep each wiring device in its package or otherwise protected until it is time to connect conductors.
3. Do not remove surface protection, such as plastic film and smudge covers, until the last possible moment.
4. Connect devices to branch circuits using pigtails that are not less than 6 inches in length.
5. When there is a choice, use side wiring with binding-head screw terminals. Wrap solid conductor tightly clockwise, 2/3 to 3/4 of the way around terminal screw.
6. Use a torque screwdriver when a torque is recommended or required by the manufacturer.
7. When conductors larger than No. 12 AWG are installed on 15- or 20-A circuits, splice No. 12 AWG pigtails for device connections.
8. Tighten unused terminal screws on the device.
9. When mounting into metal boxes, remove the fiber or plastic washers used to hold device mounting screws in yokes, allowing metal-to-metal contact.

E. Receptacle Orientation:
1. Install hospital-grade receptacles in patient-care areas with the ground pin or neutral blade at the top.

F. Dimmers:
1. Install dimmers within terms of their listing.
2. Verify that dimmers used for fan speed control are listed for that application.
3. Install unshared neutral conductors on line and load side of dimmers according to manufacturers' device listing conditions in the written instructions.

G. Adjust locations of floor service outlets and service poles to suit arrangement of partitions and furnishings.

3.2 IDENTIFICATION

A. Comply with Division 26 Section "Identification for Electrical Systems."

1. Receptacles: Identify panelboard and circuit number from which served. Use hot, stamped or engraved machine printing with black filled lettering on face of plate, and durable wire markers or tags inside outlet boxes.

3.3 FIELD QUALITY CONTROL

A. Perform tests and inspections and prepare test reports.

1. In healthcare facilities, prepare reports that comply with recommendations in NFPA 99.
2. Test Instruments: Use instruments that comply with UL 1436.
3. Test Instrument for Convenience Receptacles: Digital wiring analyzer with digital readout or illuminated LED indicators of measurement.

B. Tests for Convenience Receptacles:

1. Line Voltage: Acceptable range is 105 to 132 V.
2. Percent Voltage Drop under 15-A Load: A value of 6 percent or higher is not acceptable.
3. Ground Impedance: Values of up to 2 ohms are acceptable.
4. GFCI Trip: Test for tripping values specified in UL 1436 and UL 943.
5. Using the test plug, verify that the device and its outlet box are securely mounted.
6. The tests shall be diagnostic, indicating damaged conductors, high resistance at the circuit breaker, poor connections, inadequate fault current path, defective devices, or similar problems. Correct circuit conditions, remove malfunctioning units and replace with new ones, and retest as specified above.

C. Test straight blade convenience outlets in patient-care areas and hospital-grade convenience outlets for the retention force of the grounding blade according to NFPA 99. Retention force shall be not less than 4 oz.

END OF SECTION 262726

SECTION 26 28 16 - ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Fusible switches.
2. Nonfusible switches.
3. Receptacle switches.
4. Shunt trip switches.
5. Molded-case circuit breakers (MCCBs).
6. Molded-case switches.
7. Enclosures.

B. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 DEFINITIONS

A. NC: Normally closed.

B. NO: Normally open.

C. SPDT: Single pole, double throw.

1.4 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Enclosed switches and circuit breakers shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

1.5 MRc2: CONSTRUCTION WASTE MANAGEMENT

A. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 018113 Sustainable Design Requirements

1.6 SUBMITTALS

A. Product Data: For each type of enclosed switch, circuit breaker, accessory, and component indicated. Include dimensioned elevations, sections, weights, and manufacturers' technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.

1. Enclosure types and details for types other than NEMA 250, Type 1.
2. Current and voltage ratings.
3. Short-circuit current ratings (interrupting and withstand, as appropriate).
4. Include evidence of NRTL listing for series rating of installed devices.
5. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices, accessories, and auxiliary components.
6. Include time-current coordination curves (average melt) for each type and rating of overcurrent protective device; include selectable ranges for each type of overcurrent protective device. Submit on translucent log-log graph paper.

B. Shop Drawings: For enclosed switches and circuit breakers. Include plans, elevations, sections, details, and attachments to other work.

1. Wiring Diagrams: For power, signal, and control wiring.

C. Qualification Data: For qualified testing agency.

D. Field quality-control reports.

1. Test procedures used.
2. Test results that comply with requirements.
3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.

E. Manufacturer's field service report.

F. Operation and Maintenance Data: For enclosed switches and circuit breakers to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include the following:

1. Manufacturer's written instructions for testing and adjusting enclosed switches and circuit breakers.
2. Time-current coordination curves (average melt) for each type and rating of overcurrent protective device; include selectable ranges for each type of overcurrent protective device. Submit on translucent log-log graph paper.

1.7 QUALITY ASSURANCE

A. Testing Agency Qualifications: Member company of NETA or an NRTL.

1. Testing Agency's Field Supervisor: Currently certified by NETA to supervise on-site testing.

B. Source Limitations: Obtain enclosed switches and circuit breakers, overcurrent protective devices, components, and accessories, within same product category, from single source from single manufacturer.

C. Product Selection for Restricted Space: Drawings indicate maximum dimensions for enclosed switches and circuit breakers, including clearances between enclosures, and adjacent surfaces and other items. Comply with indicated maximum dimensions.

D. Seismic Qualification Certificates: For enclosed switches and circuit breakers, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

E. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements

F. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

G. Comply with NFPA 70.

1.8 PROJECT CONDITIONS

A. Environmental Limitations: Rate equipment for continuous operation under the following conditions unless otherwise indicated:

1. Ambient Temperature: Not less than minus 22 deg F and not exceeding 104 deg F
2. Altitude: Not exceeding 6600 feet .

1.9 COORDINATION

A. Coordinate layout and installation of switches, circuit breakers, and components with equipment served and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

1.10 EXTRA MATERIALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
2. Fuse Pullers: Two for each size and type.

1.11 PRODUCT WARRANTY

A. Warranty Period: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 FUSIBLE SWITCHES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
3. Siemens Energy & Automation, Inc.
4. Square D; a brand of Schneider Electric.

B. Type HD, Heavy Duty, Single Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate indicated fuses, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

C. Accessories:

1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
3. Class R Fuse Kit: Provides rejection of other fuse types when Class R fuses are specified.
4. Hookstick Handle: Allows use of a hookstick to operate the handle.
5. Lugs: Mechanical type, suitable for number, size, and conductor material.
6. Service-Rated Switches: Labeled for use as service equipment.

2.2 NONFUSIBLE SWITCHES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following.

1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
3. Siemens Energy & Automation, Inc.
4. Square D; a brand of Schneider Electric.

B. Type HD, Heavy Duty, Single Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

C. Accessories:

1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
3. Hookstick Handle: Allows use of a hookstick to operate the handle.
4. Lugs: Mechanical type, suitable for number, size, and conductor material.

2.3 MOLDED-CASE CIRCUIT BREAKERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
2. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
3. Siemens Energy & Automation, Inc.
4. Square D; a brand of Schneider Electric.

B. General Requirements: Comply with UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents.

C. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.

D. Adjustable, Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.

E. Electronic Trip Circuit Breakers: Field-replaceable rating plug, rms sensing, with the following field-adjustable settings:

1. Instantaneous trip.
2. Long- and short-time pickup levels.
3. Long- and short-time time adjustments.
4. Ground-fault pickup level, time delay, and I^2t response.

F. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller, and let-through ratings less than NEMA FU 1, RK-5.

G. Integrally Fused Circuit Breakers: Thermal-magnetic trip element with integral limiter-style fuse listed for use with circuit breaker and trip activation on fuse opening or on opening of fuse compartment door.

H. Ground-Fault, Circuit-Interrupter (GFCI) Circuit Breakers: Single- and two-pole configurations with Class A ground-fault protection (6-mA trip).

I. Ground-Fault, Equipment-Protection (GFEP) Circuit Breakers: With Class B ground-fault protection (30-mA trip).

J. Features and Accessories:

1. Standard frame sizes, trip ratings, and number of poles.
2. Lugs: Mechanical type, suitable for number, size, trip ratings, and conductor material.

3. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge lighting circuits.
4. Ground-Fault Protection: Comply with UL 1053; integrally mounted, self-powered [type with mechanical ground-fault indicator; relay with adjustable pickup and time-delay settings, push-to-test feature, internal memory, and shunt trip unit; and three-phase, zero-sequence current transformer/sensor.
5. Shunt Trip: Trip coil energized from separate circuit, with coil-clearing contact.
6. Retain first option in first subparagraph below for solid-state trip units; retain second option for thermal-magnetic trip units.
7. Accessory Control Power Voltage: Integrally mounted, self-powered.

2.4 ENCLOSURES

A. Enclosed Switches and Circuit Breakers: NEMA AB 1, NEMA KS 1, NEMA 250, and UL 50, to comply with environmental conditions at installed location.
1. Indoor, Dry and Clean Locations: NEMA 250, Type 1.
2. Outdoor Locations: NEMA 250, .Type 3R
3. Kitchen or Wash-Down Areas: NEMA 250, Type 4X, stainless steel.
4. Other Wet or Damp, Indoor Locations: NEMA 250**,** Type 4
5. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: NEMA 250, Type 12.
6. Hazardous Areas Indicated on Drawings: NEMA 250, Type 7.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine elements and surfaces to receive enclosed switches and circuit breakers for compliance with installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install individual wall-mounted switches and circuit breakers with tops at uniform height unless otherwise indicated.

B. Comply with mounting and anchoring requirements specified in Division 26 Section "Vibration and Seismic Controls for Electrical Systems."

C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.

D. Install fuses in fusible devices.

E. Comply with NECA 1.

3.3 IDENTIFICATION

A. Comply with requirements in Division 26 Section "Identification for Electrical Systems."

1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
2. Label each enclosure with engraved metal or laminated-plastic nameplate.

3.4 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

C. Perform tests and inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

D. Acceptance Testing Preparation:

1. Test insulation resistance for each enclosed switch and circuit breaker, component, connecting supply, feeder, and control circuit.
2. Test continuity of each circuit.

E. Tests and Inspections:

1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
3. Perform the following infrared scan tests and inspections and prepare reports:
    a. Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each enclosed switch and circuit breaker. Remove front panels so joints and connections are accessible to portable scanner.
    b. Instruments and Equipment: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

4. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

F. Enclosed switches and circuit breakers will be considered defective if they do not pass tests and inspections.

G. Prepare test and inspection reports, including a certified report that identifies enclosed switches and circuit breakers and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.5 ADJUSTING

A. Adjust moving parts and operable components to function smoothly, and lubricate as recommended by manufacturer.

B. Set field-adjustable circuit-breaker trip ranges as specified in Division 26 Section "Overcurrent Protective Device Coordination Study.

END OF SECTION 262816

SECTION 26 29 13 - ENCLOSED CONTROLLERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes the following enclosed controllers rated 600 V and less:

1. Full-voltage manual.
2. Full-voltage magnetic.
3. Reduced-voltage magnetic.
4. Reduced-voltage solid state.
5. Multispeed.

B. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 DEFINITIONS

A. CPT: Control power transformer.

B. MCCB: Molded-case circuit breaker.

C. MCP: Motor circuit protector.

D. N.C.: Normally closed.

E. N.O.: Normally open.

F. OCPD: Overcurrent protective device.

G. SCR: Silicon-controlled rectifier.

1.4 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Enclosed controllers shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event"

1.5 MRc2: Construction Waste Management

A. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 018113 Sustainable Design Requirements.

B. EQc4.1: LOW-EMITTING MATERIALS – SEALANTS AND ADHESIVES

All sealants, adhesives, and sealant primers used on the interior of the building shall comply with the project requirements for Low-Emitting Materials – Sealants and Adhesives. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

1.6 SUBMITTALS

A. Product Data: For each type of enclosed controller. Include manufacturer's technical data on features, performance, electrical characteristics, ratings, and enclosure types and finishes.

B. Shop Drawings: For each enclosed controller. Include dimensioned plans, elevations, sections, details, and required clearances and service spaces around controller enclosures.

1. Show tabulations of the following:

a. Each installed unit's type and details.
b. Factory-installed devices.
c. Nameplate legends.
d. Short-circuit current rating of integrated unit.
e. Listed and labeled for integrated short-circuit current (withstand) rating of OCPDs in combination controllers by an NRTL acceptable to authorities having jurisdiction.
f. Features, characteristics, ratings, and factory settings of individual OCPDs in combination controllers.

2. Wiring Diagrams: For power, signal, and control wiring.

C. Qualification Data: For qualified testing agency.
1. anchorage devices on which the certification is based and their installation requirements.

D. Seismic Qualification Certificates: For enclosed controllers, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

E. Field quality-control reports.

F. Operation and Maintenance Data: For enclosed controllers to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Operation and Maintenance Data," include the following:

1. Routine maintenance requirements for enclosed controllers and installed components.
2. Manufacturer's written instructions for testing and adjusting circuit breaker and MCP trip settings.
3. Manufacturer's written instructions for setting field-adjustable overload relays.
4. Manufacturer's written instructions for testing, adjusting, and reprogramming reduced-voltage solid-state controllers.

G. Load-Current and Overload-Relay Heater List: Compile after motors have been installed, and arrange to demonstrate that selection of heaters suits actual motor nameplate full-load currents.

H. Load-Current and List of Settings of Adjustable Overload Relays: Compile after motors have been installed, and arrange to demonstrate that switch settings for motor running overload protection suit actual motors to be protected.

1.7 QUALITY ASSURANCE

A. Testing Agency Qualifications: Member company of NETA or an NRTL.

1. Testing Agency's Field Supervisor: Currently certified by NETA to supervise on-site testing.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

C. Comply with NFPA 70.

D. IEEE Compliance: Fabricate and test enclosed controllers according to IEEE 344 to withstand seismic forces defined in Division 26 Section "Vibration and Seismic Controls for Electrical Systems."

1.8 DELIVERY, STORAGE, AND HANDLING

A. Store enclosed controllers indoors in clean, dry space with uniform temperature to prevent condensation. Protect enclosed controllers from exposure to dirt, fumes, water, corrosive substances, and physical damage.

B. If stored in areas subject to weather, cover enclosed controllers to protect them from weather, dirt, dust, corrosive substances, and physical damage.

1.9 PROJECT CONDITIONS

A. Environmental Limitations: Rate equipment for continuous operation under the following conditions unless otherwise indicated:

1. Ambient Temperature: Not less than minus 22 deg F and not exceeding 104 deg F.
2. Altitude: Not exceeding 6600 feet .

1.10 COORDINATION

A. Coordinate layout and installation of enclosed controllers with other construction including conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

B. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

C. Coordinate installation of roof curbs, equipment supports, and roof penetrations.

1.11 EXTRA MATERIALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fuses for Fused Switches: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
2. Control Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.
3. Indicating Lights: Two of each type and color installed.
4. Auxiliary Contacts: Furnish one (s) for each size and type of magnetic controller installed.
5. Power Contacts: Furnish three spares for each size and type of magnetic contactor installed.

1.12 WARRANTY

A. Warranty Period: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 FULL-VOLTAGE CONTROLLERS

A. General Requirements for Full-Voltage Controllers: Comply with NEMA ICS 2, general purpose, Class A.

B. Motor-Starting Switches: "Quick-make, quick-break" toggle or push-button action; marked to show whether unit is off or on.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
    b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
    c. Rockwell Automation, Inc.; Allen-Bradley brand.
    d. Siemens Energy & Automation, Inc.
    e. Square D; a brand of Schneider Electric.

C. Fractional Horsepower Manual Controllers: "Quick-make, quick-break" toggle or push-button action; marked to show whether unit is off, on, or tripped.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following.

    a. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
    b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
    c. Rockwell Automation, Inc.; Allen-Bradley brand.
    d. Siemens Energy & Automation, Inc.
    e. Square D; a brand of Schneider Electric.

2. Configuration: Nonreversing
3. Overload Relays: Inverse-time-current characteristics; NEMA ICS 2, Class 10 tripping characteristics; heaters matched to nameplate full-load current of actual protected motor; external reset push button bimetallic type.
4. Red pilot light.
5. N.O., N.C**.** auxiliary contact.

D. Integral Horsepower Manual Controllers: "Quick-make, quick-break" toggle or push-button action; marked to show whether unit is off, on, or tripped.

1. Manufacturers: Subject to compliance with requirements,[provide products by one of the following:

    a. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
    b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
    c. Rockwell Automation, Inc.; Allen-Bradley brand.
    d. Siemens Energy & Automation, Inc.
    e. Square D; a brand of Schneider Electric.

2. Configuration: Nonreversing.
3. Overload Relays: Inverse-time-current characteristics; NEMA ICS 2, Class 10 tripping characteristics; heaters and sensors in each phase, matched to nameplate full-load current of actual protected motor and having appropriate adjustment for duty cycle; external reset push button bimetallic type.
4. Red pilot light.
5. N.O., N.C. auxiliary contact.

E. Magnetic Controllers: Full voltage, across the line, electrically held.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
c. Rockwell Automation, Inc.; Allen-Bradley brand.
d. Siemens Energy & Automation, Inc.
e. Square D; a brand of Schneider Electric.

2. Configuration: Nonreversing
3. Contactor Coils: Pressure-encapsulated type.

a. Operating Voltage: Depending on contactor NEMA size and line-voltage rating, manufacturer's standard matching control power or line voltage.

4. Power Contacts: Totally enclosed, double-break, silver-cadmium oxide; assembled to allow inspection and replacement without disturbing line or load wiring.
5. Control Circuits: 24 or 120V ac; obtained from integral CPT, with primary and secondary fuses with of sufficient capacity to operate integral devices and remotely located pilot, indicating, and control devices.

a. CPT Spare Capacity: 50VA.

6. Bimetallic Overload Relays:

a. Inverse-time-current characteristic.
b. Class 10 tripping characteristic.
c. Heaters in each phase matched to nameplate full-load current of actual protected motor and with appropriate adjustment for duty cycle.
d. Ambient compensated.
e. Automatic resetting.

F. Combination Magnetic Controller: Factory-assembled combination of magnetic controller, OCPD, and disconnecting means.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following.

a. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
c. Rockwell Automation, Inc.; Allen-Bradley brand.
d. Siemens Energy & Automation, Inc.
e. Square D; a brand of Schneider Electric.

2. Nonfusible Disconnecting Means:

a. NEMA KS 1, heavy-duty, horsepower-rated, nonfusible switch.
b. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.

2.2 MULTISPEED MAGNETIC CONTROLLERS

A. General Requirements for Multispeed Magnetic Controllers: Comply with NEMA ICS 2, general purpose, Class A.

B. Multispeed Magnetic Controllers: Two speed, full voltage, across the line, electrically held.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

   a. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
   b. General Electric Company; GE Consumer & Industrial - Electrical Distribution.
   c. Rockwell Automation, Inc.; Allen-Bradley brand.
   d. Siemens Energy & Automation, Inc.
   e. Square D; a brand of Schneider Electric.

2. Configuration: Nonreversing;.
3. Contactor Coils: Pressure-encapsulated type.

   a. Operating Voltage: Depending on contactor NEMA size and line-voltage rating, manufacturer's standard matching control power or line voltage.

4. Power Contacts: Totally enclosed, double break, silver-cadmium oxide; assembled to allow inspection and replacement without disturbing line or load wiring.

5. Compelling relays shall ensure that motor will start only at low speed.
6. Accelerating timer relays shall ensure properly timed acceleration through speeds lower than that selected.
7. Decelerating timer relays shall ensure automatically timed deceleration through each speed.
8. Antiplugging timer relays shall ensure a time delay when transferring from FORWARD to REVERSE and back.

9. Bimetallic Overload Relays:

   a. Inverse-time-current characteristic.
   b. Class 10 tripping characteristic.
   c. Heaters in each phase matched to nameplate full-load current of actual protected motor and with appropriate adjustment for duty cycle.
   d. Ambient compensated.
   e. Automatic resetting.

2.3 ENCLOSURES

A. Enclosed Controllers: NEMA ICS 6, to comply with environmental conditions at installed location.

1. Dry and Clean Indoor Locations: Type 1.
2. Outdoor Locations: Type 3R.
3. Kitchen or Wash-Down Areas: Type 4X.
4. Other Wet or Damp Indoor Locations: Type 4.
5. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: Type 12.

2.4 ACCESSORIES

A. General Requirements for Control Circuit and Pilot Devices: NEMA ICS 5; factory installed in controller enclosure cover unless otherwise indicated.

1. Push Buttons, Pilot Lights, and Selector Switches: Heavy duty, type.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and surfaces to receive enclosed controllers, with Installer present, for compliance with requirements and other conditions affecting performance of the Work.

B. Examine enclosed controllers before installation. Reject enclosed controllers that are wet, moisture damaged, or mold damaged.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Wall-Mounted Controllers: Install enclosed controllers on walls with tops at uniform height unless otherwise indicated, and by bolting units to wall or mounting on lightweight structural-steel channels bolted to wall. For controllers not at walls, provide freestanding racks complying with Division 26 Section "Hangers and Supports for Electrical Systems."

B. Floor-Mounted Controllers: Install enclosed controllers on 4-inch nominal-thickness concrete base. Comply with requirements for concrete base specified in Division 03 Section Cast-in-Place Concrete

1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
4. Install anchor bolts to elevations required for proper attachment to supported equipment.

C. Seismic Bracing: Comply with requirements specified in Division 26 Section "Vibration and Seismic Controls for Electrical Systems."

D. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.

E. Install fuses in each fusible-switch enclosed controller.

F. Install fuses in control circuits if not factory installed. Comply with requirements in Division 26 Section "Fuses."

G. Install heaters in thermal overload relays. Select heaters based on actual nameplate full-load amperes after motors have been installed.

H. Install, connect, and fuse thermal-protector monitoring relays furnished with motor-driven equipment.

I. Install power factor correction capacitors. Connect to the [**line**] [**load**] side of overload relays. If connected to the load side of overload relays, adjust overload heater sizes to accommodate the reduced motor full-load currents.

J. Comply with NECA 1.

3.3 IDENTIFICATION

A. Identify enclosed controllers, components, and control wiring. Comply with requirements for identification specified in Division 26 Section "Identification for Electrical Systems."

1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
2. Label each enclosure with engraved nameplate.
3. Label each enclosure-mounted control and pilot device.

3.4 CONTROL WIRING INSTALLATION

A. Install wiring between enclosed controllers and remote devices an**d** facility's central control system. Comply with requirements in Division 26 Section "Control-Voltage Electrical Power Cables."

B. Bundle, train, and support wiring in enclosures.

C. Connect selector switches and other automatic-control selection devices where applicable.

1. Connect selector switches to bypass only those manual- and automatic-control devices that have no safety functions when switch is in manual-control position.
2. Connect selector switches with enclosed-controller circuit in both manual and automatic positions for safety-type control devices such as low- and high-pressure cutouts, high-temperature cutouts, and motor overload protectors.

3.5 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

C. Perform tests and inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

D. Acceptance Testing Preparation:

1. Test insulation resistance for each enclosed controller, component, connecting supply, feeder, and control circuit.
2. Test continuity of each circuit.

E. Tests and Inspections:

1. Inspect controllers, wiring, components, connections, and equipment installation. Test and adjust controllers, components, and equipment**.**
2. Test insulation resistance for each enclosed-controller element, component, connecting motor supply, feeder, and control circuits.
3. Test continuity of each circuit.
4. Verify that voltages at controller locations are within plus or minus 10 percent of motor nameplate rated voltages. If outside this range for any motor, notify Construction Manager & Owner before starting the motor(s).
5. Test each motor for proper phase rotation.
6. Perform each electrical test and visual and mechanical inspection stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
7. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
8. Perform the following infrared (thermographic) scan tests and inspections and prepare reports:

    a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each multi-pole enclosed controller. Remove front panels so joints and connections are accessible to portable scanner.
    b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each multi-pole enclosed controller 11 months after date of Substantial Completion.
    c. Instruments and Equipment: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

9. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

F. Enclosed controllers will be considered defective if they do not pass tests and inspections.

G. Prepare test and inspection reports including a certified report that identifies enclosed controllers and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.6 ADJUSTING

A. Set field-adjustable switches, auxiliary relays, time-delay relays, timers, and overload-relay pickup and trip ranges.

B. Adjust overload-relay heaters or settings if power factor correction capacitors are connected to the load side of the overload relays.

C. Adjust the trip settings of MCPs and thermal-magnetic circuit breakers with adjustable instantaneous trip elements. Initially adjust to six times the motor nameplate full-load ampere ratings and attempt to start motors several times, allowing for motor cooldown between starts. If tripping occurs on motor inrush, adjust settings in increments until motors start without tripping. Do not exceed eight times the motor full-load amperes (or 11 times for NEMA Premium Efficient motors if required). Where these maximum settings do not allow starting of a motor, notify Construction Manager & Owner before increasing settings.

D. Set the taps on reduced-voltage autotransformer controllers at **65** percent.

E. Set field-adjustable switches and program microprocessors for required start and stop sequences in reduced-voltage solid-state controllers.

F. Set field-adjustable circuit-breaker trip ranges as specified in Division 26 Section "Overcurrent Protective Device Coordination Study."

3.7 PROTECTION

A. Temporary Heating: Apply temporary heat to maintain temperature according to manufacturer's written instructions until enclosed controllers are ready to be energized and placed into service.

B. Replace controllers whose interiors have been exposed to water or other liquids prior to Substantial Completion.

3.8 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain enclosed controllers, and to use and reprogram microprocessor-based, reduced-voltage solid-state controllers.

B. Refer Division 01 for administrative and procedural requirements for demonstration and training.

END OF SECTION 262913

SECTION 26 32 13 – DIESEL GENERATOR

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes packaged engine-generator sets suitable for use in mission critical applications with the features as specified and indicated. Engine generators will be used as the Standby power source for the system, but shall be capable of providing reliable power with no run-time limitations while the primary source of power is unavailable.

B. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 DEFINITIONS

A. Emergency Standby Power (ESP): Per ISO 8528: The maximum power available during a variable electrical power sequence, under the stated operating conditions, for which a generating set is capable of delivering in the event of a utility power outage or under test conditions for up to 200 hours of operation per year with the maintenance intervals and procedures being carried out as prescribed by the manufacturers. The permissible average power output (Ppp) over 24 hours of operation shall not exceed 70 percent of the ESP unless otherwise agreed by the RIC engine manufacturer.

B. Prime Power (PRP): Per ISO 8528: The maximum power which a generating set is capable of delivering continuously whilst supplying a variable electrical load when operated for an unlimited number of hours per year under the agreed operating conditions with the maintenance intervals and procedures being carried out as a prescribed by the manufacturer. The permissible average power output (Ppp) over 24 hours of operation shall not exceed 70 percent of the PRP unless otherwise agreed by the RIC engine manufacturer.

C. Limited Time running Power (LTP): Per ISO 8528: The maximum power available, under the agreed operating conditions, for which the generating set is capable of delivering for up to 500 hours of operation per year with the maintenance intervals and procedures being carried out as prescribed by the manufacturers.

D. Continuous Operating Power (COP): Per ISO 8528: The maximum power which a generating set is capable of delivering continuously whilst supplying a constant electrical load when operated for an unlimited number of hours per year under the agreed operating conditions with the maintenance intervals and procedures being carried out as a prescribed by the manufacturer.

E. Data Center Continuous (DCC): The maximum power which a generating set is capable of delivering continuously whilst supplying a variable or constant electrical load when operated for an unlimited number of hours in a data center application under the agreed operating conditions with the maintenance intervals and procedures being carried out as a prescribed by the manufacturer. The permissible average power output (Ppp) over 24 hours of operation shall not exceed 100 percent of the DCC rating.

F. Operational Bandwidth: The total variation from the lowest to highest value of a parameter over the range of conditions indicated, expressed as a percentage of the nominal value of the parameter.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of packaged engine generator indicated. Include rated capacities, operating characteristics, and furnished specialties and accessories. In addition, include the following:

1. Thermal damage curve for generator.

2. Time-current characteristic curves for generator protective device.

3. Sound test data, based on a free field requirement.

B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, and location and size of each field connection.

1. Dimensioned outline plan and elevation drawings of engine-generator set and other components specified.

2. Wiring Diagrams: Control interconnection, Customer connections.

C. Certifications:

1. Submit statement of compliance which states the proposed product(s) is certified to the emissions standards required by the location for EPA, stationary emergency application.

1.5 INFORMATIONAL SUBMITTALS

A. Source quality-control test reports.

1. Certified summary of prototype-unit test report. See requirements in Part 2 "Source Quality Control" Article Part A. Include statement indicating torsional compatibility of components.

2. Certified Test Report: Provide certified test report documenting factory test per the requirements of this specification, as well as certified factory test of generator set sensors per NFPA110 level 1.

3. List of factory tests to be performed on units to be shipped for this Project.

4. Report of exhaust emissions and compliance statement certifying compliance with applicable regulations.

B. Warranty:

1. Submit manufacturer's warranty statement to be provided for this Project.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.

B. Manufacturer Qualifications: A qualified manufacturer. Maintain, within 50 of Project site, a service center capable of providing training, parts, and emergency maintenance repairs.

C. Source Limitations: Obtain packaged generator sets and auxiliary components through one source from a single manufacturer.

D. Comply with NFPA 37 (Standard For the Installation and Use of Stationary Combustion Engines and Gas Turbines).

E. Comply with NFPA 70 (National Electrical Code. Equipment shall be suitable for use in systems in compliance to Article 700, 701, and 702).

F. Comply with NFPA 99 (Essential Electrical Systems for Health Care Facilities).

G. Comply with NFPA 110 (Emergency and Standby Power Systems) requirements for Level 1 emergency power supply system.

1.7 PROJECT CONDITIONS

A. Environmental Conditions: Engine-generator system shall withstand the following environmental conditions without mechanical or electrical damage or degradation of performance capability:

1. Ambient Temperature: 0.0 deg C (32.0 deg F) to 37.78 deg C (100.0 deg F).

2. Relative Humidity: 0 to 95 percent.

3. Altitude: Sea level

1.8 WARRANTY

A. Base Warranty: Manufacturer shall provide base warranty coverage on the material and workmanship of the generator set for a minimum of twenty-four (24) months for Standby product and twenty-four (24) months for Prime/Continuous product from registered commissioning and start-up.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: The basis for this specification is MTU/Curtis Engine equipment, approved equals may be considered if equipment performance is shown to meet the requirements herein.

2.2 ENGINE-GENERATOR SET

A. Factory-assembled and -tested, engine-generator set.

B. Mounting Frame: Maintain alignment of mounted components without depending on concrete foundation; and have lifting attachments.

1. Rigging Information: Indicate location of each lifting attachment, generator-set center of gravity, and total package weight in submittal drawings.

C. Capacities and Characteristics:

1. Power Output Ratings: Electrical output power rating for Standby operation of not less than 1000.0kW, at 80 percent lagging power factor, 277/480, Series Wye, Three phase, 4 -wire, 60 hertz.

2. Alternator shall be capable of accepting maximum 1000.0 kVA in a single step and be capable of recovering to a minimum of 90% of rated no load voltage. Following the application of the specified kVA load at near zero power factor applied to the generator set.

3. Nameplates: For each major system component to identify manufacturer's name and address, and model and serial number of component. The engine-generator nameplate shall include information of the power output rating of the equipment.

D. Generator-Set Performance:

1. Steady-State Voltage Operational Bandwidth: 0.5 percent of rated output voltage from no load to full load.

2. Transient Voltage Performance: Not more than 20 percent variation for 25 percent step-load increase or decrease. Voltage shall recover and remain within the steady-state operating band within 5 seconds. On application of a 100% load step the generator set shall recover to stable voltage within 10 seconds.

3. Steady-State Frequency Operational Bandwidth: 0.25 percent of rated frequency from no load to full load.

4. Steady-State Frequency Stability: When system is operating at any constant load within the rated load, there shall be no random speed variations outside the steady-state operational band and no hunting or surging of speed.

5. Transient Frequency Performance: Not more than 15 percent variation for 25 percent step-load increase or decrease. Frequency shall recover and remain within the steady-state operating band within 5 seconds. On application of a 100% load step the generator set shall recover to stable frequency within 10 seconds.

6. Output Waveform: At full load, harmonic content measured line to line or line to neutral shall not exceed 5 percent total and 3 percent for any single harmonic. Telephone influence factor, determined according to NEMA MG 1, shall not exceed 50.

7. Sustained Short-Circuit Current: For a 3-phase, bolted short circuit at system output terminals, system shall supply a minimum of 300 percent of rated full-load current for not less than 8 seconds without damage to generator system components. For a 1-phase, bolted short circuit at system output terminals, system shall regulate both voltage and current to prevent over-voltage conditions on the non-faulted phases.

8. Start Time: Comply with NFPA 110, Level 1, Type 10, system requirements.

9. Ambient Condition Performance: Engine generator shall be designed to allow operation at full rated load in an ambient temperature under site conditions, based on highest ambient condition. Ambient temperature shall be as measured at the air inlet to the engine generator for enclosed units, and at the control of the engine generator for machines installed in equipment rooms.

2.3 ENGINE

A. Fuel: ASTM D975 #2 Diesel Fuel

B. Rated Engine Speed: 1800RPM.

C. Lubrication System: The following items are mounted on engine or skid:

1. Lube oil pump: shall be positive displacement, mechanical, full pressure pump.

2. Filter and Strainer: Provided by the engine manufacturer of record to provide adequate filtration for the prime mover to be used.

3. Crankcase Drain: Arranged for complete gravity drainage to an easily removable container with no disassembly and without use of pumps, siphons, special tools, or appliances.

D. Engine Fuel System: The engine fuel system shall be installed in strict compliance to the engine manufacturer's instructions

E. Main Fuel Pump: Mounted on engine. Pump ensures adequate primary fuel flow under starting and load conditions.

F. Coolant Jacket Heater: Electric-immersion type, factory installed in coolant jacket system. Comply with NFPA 110 requirements for Level 1 equipment for heater capacity and performance.

1. Designed for operation on a single 480 VAC, Three phase, 60Hz power connection. Heater voltage shall be shown on the project drawings.

2. Installed with isolation valves to isolate the heater for replacement of the element without draining the engine cooling system or significant coolant loss.

3. Provided with a 24VDC thermostat, installed at the engine thermostat housing

G. Governor: Adjustable isochronous, with speed sensing. The governing system dynamic capabilities shall be controlled as a function of engine coolant temperature to provide fast, stable operation at varying engine operating temperature conditions. The control system

shall actively control the fuel rate as appropriate to the state of the engine generator. Fuel rate shall be regulated as a function of starting, accelerating to start disconnect speed, accelerating to rated speed, and operating in various isochronous states.

H. Cooling System: Closed loop, liquid cooled

1. The generator set manufacturer shall provide prototype test data for the specific hardware proposed demonstrating that the machine will operate at rated standby load in an outdoor ambient condition of 40 deg C.

2. Coolant: Solution of 50 percent ethylene-glycol-based antifreeze and 50 percent water, with anticorrosion additives as recommended by engine manufacturer.

3. Size of Radiator overflow tank: Adequate to contain expansion of total system coolant from cold start to 110 percent load condition.

4. Expansion Tank: Constructed of welded steel plate and rated to withstand maximum closed-loop coolant system pressure for engine used. Equip with gage glass and petcock.

5. Temperature Control: Self-contained, thermostatic-control valve modulates coolant flow automatically to maintain optimum constant coolant temperature as recommended by engine manufacturer.

6. Duct Flange: Generator sets installed indoors shall be provided with a flexible radiator duct adapter flange.

I. Muffler/Silencer: Selected with performance as required to meet sound requirements of the application, sized as recommended by engine manufacturer and selected with exhaust piping system to not exceed engine manufacturer's engine backpressure requirements. For generator sets with outdoor enclosures the silencer shall be inside the enclosure.

J. Air-Intake Filter: Engine-mounted air cleaner with replaceable dry-filter element and restriction indicator.

K. Starting System: 12 or 24V, as recommended by the engine manufacturer; electric, with negative ground.

1. Components: Sized so they will not be damaged during a full engine-cranking cycle with ambient temperature at maximum specified in Part 1 "Project Conditions" Article.

2. Cranking Cycle: As required by NFPA 110 for level 1 systems.

3. Battery Cable: Size as recommended by engine manufacturer for cable length as required. Include required interconnecting conductors and connection accessories.

4. Battery Compartment: Factory fabricated of metal with acid-resistant finish.

5. Battery-Charging Alternator: Factory mounted on engine with solid-state voltage regulation. The battery charging alternator shall have sufficient capacity to recharge the

batteries with all parasitic loads connected within 4 hours after a normal engine starting sequence.

6. Battery Chargers: Unit shall comply with UL 1236, provide fully regulated, constant voltage, current limited, battery charger for each battery bank. It will include the following features:

   a. Operation: Equalizing-charging rate based on generator set manufacturer's recommendations shall be initiated automatically after battery has lost charge until an adjustable equalizing voltage is achieved at battery terminals. Unit shall then be automatically switched to a lower float-charging mode and shall continue to operate in that mode until battery is discharged again.

   b. Automatic Temperature Compensation: Adjust float and equalize voltages for variations in ambient temperature from minus 20 deg C to plus 40 deg C to prevent overcharging at high temperatures and undercharging at low temperatures.

   c. Automatic Voltage Regulation: Maintain constant output voltage regardless of input voltage variations up to plus or minus 10 percent.

   d. Safety Functions: Sense abnormally low battery voltage and close contacts providing low battery voltage indication on control and monitoring panel. Sense high battery voltage and loss of ac input or dc output of battery charger. Either condition shall close contacts that provide a battery-charger malfunction indication at system control and monitoring panel.

   e. Provide LED indication of general charger condition, including charging, faults, and modes. Provide a LCD display to indicate charge rate and battery voltage. Charger shall provide relay contacts for fault conditions as required by NFPA110.

   f. Enclosure and Mounting: NEMA, Type 1, wall-mounted cabinet.

2.4 FUEL OIL STORAGE

A. Comply with NFPA 30.

B. Sub Base-Mounted Fuel Oil Tank: Provide a double wall secondary containment type sub base fuel storage tank. The tank shall be constructed of corrosion resistant steel and shall be UL 142 listed and labeled. The fuel tank shall include the following features:

   1. Capacity: Fuel for 48 Hour(s) continuous operation at 100 percent rated power output.

   2. Tank rails and lifting eyes shall be rated for the full dry weight of the tank, genset, and enclosure.

   3. Electrical stub up(s)

   4. Normal & emergency vents

   5. Lockable fuel fill

   6. Mechanical fuel level gauge

7. High and low level switches to indicate fuel level

8. Leak detector switch

9. Sub base tank shall include a welded steel containment basin, sized at a minimum of 110% of the tank capacity to prevent escape of fuel into the environment in the event of a tank rupture.

10. Fill port with overfill prevention valve (OFPV)

11. 5 gallon fill/spill dam or bucket

12. Tank design shall meet the regional requirements for the Project location

2.5 CONTROL AND MONITORING

A. Engine generator control shall be microprocessor based and provide automatic starting, monitoring, protection and control functions for the unit.

B. Automatic Starting System Sequence of Operation: When mode-selector switch on the control and monitoring panel is in the automatic position, remote-control contacts in one or more separate automatic transfer switches initiate starting and stopping of generator set. When mode-selector switch is switched to the on position, generator set starts. The off position of same switch initiates generator-set shutdown. (Switches with different configurations but equal functions are acceptable.) When generator set is running, specified system or equipment failures or derangements automatically shut down generator set and initiate alarms. Operation of the local (generator set-mounted) and/or remote emergency-stop switch also shuts down generator set.

C. Manual Starting System Sequence of Operation: Switching on-off switch on the generator control panel to the on position starts generator set. The off position of same switch initiates generator-set shutdown. When generator set is running, specified system or equipment failures or derangements automatically shut down generator set and initiate alarms. Operation of the local (generator set-mounted) and/or remote emergency-stop switch also shuts down generator set.

D. Configuration: Operating and safety indications, protective devices, system controls, engine gages and associated equipment shall be grouped in a common control and monitoring panel. Mounting method shall isolate the control panel from generator-set vibration. AC output power circuit breakers and other output power equipment shall not be mounted in the control enclosure.

E. Indicating and Protective Devices and Controls: As required by NFPA 110 for Level 1 system, and the following:

1. AC voltmeter (3-phase, line to line and line to neutral values).

2. AC ammeter (3-phases).

3. AC frequency meter.

4. AC kW output (total and for each phase). Display shall indicate power flow direction.

5. AC kVA output (total and for each phase). Display shall indicate power flow direction.

6. AC Power factor (total and for each phase). Display shall indicate leading or lagging condition.

7. Ammeter-voltmeter displays shall simultaneously display conditions for all three phases.

8. Emergency Stop Switch: Switch shall be a red “mushroom head” pushbutton device complete with lock-out/tag-out provisions. Depressing switch shall cause the generator set to immediately stop the generator set and prevent it from operating.

9. Fault Reset Switch: Supply a dedicated control switch to reset/clear fault conditions.

10. DC voltmeter (alternator battery charging).

11. Engine-coolant temperature gauge.

12. Engine lubricating-oil pressure gauge.

13. Running-time meter.

14. Generator-voltage and frequency digital raise/lower switches. Rheostats for these functions are not acceptable. The control shall adjustment of these parameters in a range of plus or minus 5% of the voltage and frequency operating set point (not nominal voltage and frequency values.) The voltage and frequency adjustment functions shall be disabled when the paralleling breaker is closed.

15. Fuel tank derangement alarm.

16. Fuel tank high-level shutdown of fuel supply alarm.

17. AC Protective Equipment: The control system shall include over/under voltage, reverse kVAR, reverse kW, over load (kW) short circuit, over current, loss of voltage reference, and over excitation shut down protection. There shall be a ground fault alarm for generator sets rated over 1000 amps, overload warning, and overcurrent warning alarm.

18. Status LED indicating lamps to indicate remote start signal present at the control, existing shutdown condition, existing alarm condition, not in auto, and generator set running.

19. A graphical display panel with appropriate navigation devices shall be provided to view all information noted above, as well as all engine status and alarm/shutdown conditions (including those from an integrated engine emission control system). The display shall also include integrated provisions for adjustment of the gain and stability settings for the governing and voltage regulation systems.

20. Panel lighting system to allow viewing and operation of the control when the generator room or enclosure is not lighted.

21. Data Logging: The control system shall log the latest 20 different alarm and shut down conditions, the total number of times each alarm or shutdown has occurred, and the date and time the latest of these shutdown and fault conditions occurred.

22. DC control Power Monitoring: The control system shall continuously monitor DC power supply to the control, and annunciate low or high voltage conditions. It shall also provide an alarm indicating imminent failure of the battery bank based on degraded voltage recover on loading (engine cranking).

F. Control Heater: Generator sets that are installed in outdoor enclosures, or are in tropical or coastal environments shall be provided with control heaters for anti-condensation protection.

G. Common Remote Audible Alarm: Comply with NFPA 110 requirements for Level 1 systems. Include necessary contacts and terminals in control and monitoring panel.

1. Overcrank shutdown.

2. Coolant low-temperature alarm.

3. Control switch not in auto position.

4. Battery-charger malfunction alarm.

5. Battery low-voltage alarm.

H. Remote Alarm Annunciator: Comply with NFPA 110. An LED labeled with proper alarm conditions shall identify each alarm event and a common audible signal shall sound for each alarm condition.

I. Remote Emergency-Stop Switch: Flush; wall mounted, unless otherwise indicated; and labeled. Push button shall be protected from accidental operation.

2.6 GENERATOR OVERCURRENT AND FAULT PROTECTION

A. Generator Overcurrent Protection: The generator set shall be provided with a UL Listed/CSA Certified protective device that is coordinated with the alternator provided to prevent damage to the generator set on any possible overload or overcurrent condition external to the machine. The protective device shall be listed as a utility grade protective device under UL category NRGU. The control system shall be subject to UL follow-up service at the manufacturing location to verify that the protective system is fully operational as manufactured. Protector shall perform the following functions:

1. Initiates a generator kW overload alarm when generator has operated at an overload equivalent to 110 percent of full-rated load for 60 seconds. Indication for this alarm is integrated with other generator-set malfunction alarms.

2. Under single phase or multiple phase fault conditions, or on overload conditions, indicates an alarm conditions when the current flow is in excess of 110% of rated current for more than 10 seconds.

3. Under single phase or multiple phase fault conditions, operates to switch off alternator excitation at the appropriate time to prevent damage to the alternator.

4. The operator panel shall indicate the nature of the fault condition as either a short circuit or an overload.

5. Senses clearing of a fault by other overcurrent devices and controls recovery of rated voltage to avoid overshoot greater than 120% of nominal voltage.

6. The protective system provided shall not include an instantaneous trip function.

B. Ground-Fault Indication: Comply with NFPA 70, "Emergency System" signals for ground-fault. Integrate ground-fault alarm indication with other generator-set alarm indications.

2.7 GENERATOR, EXCITER, AND VOLTAGE REGULATOR

A. Comply with NEMA MG 1.

B. Drive: Generator shaft shall be directly connected to engine shaft. Exciter shall be rotated integrally with generator rotor.

C. Electrical Insulation: Class H

D. Temperature Rise: 150 / Class H, Standby environment.

E. Construction shall prevent mechanical, electrical, and thermal damage due to vibration, over speed up to 125 percent of rating, and heat during operation at 110 percent of rated capacity.

F. Permanent Magnet Generator (PMG) shall provide excitation power for optimum motor starting and short circuit performance.

G. Enclosure: Drip-proof.

H. Voltage Regulator: Solid-state type, separate from exciter, providing performance as specified. The voltage regulation system shall be microprocessor-controlled, 3-phase true RMS sensing, full wave rectified, and provide a pulse-width modulated signal to the exciter. No exceptions or deviations to these requirements will be permitted.

I. The alternator shall be provided with anti-condensation heater(s) in all applications where the generator set is provided in an outdoor enclosure, or when the generator set is installed in a coastal or tropical environment.

J. Windings: Two-thirds pitch stator winding and fully linked amortisseur winding. Alternators operating at voltage higher than 690VAC shall be provided with form-wound stator coils.

K. Subtransient Reactance: 12 percent maximum, based on the rating of the engine generator set.

2.8 OUTDOOR GENERATOR-SET CUSTOM ENCLOSURE

A. Description: Sound Attenuated Steel housing. Multiple panels shall be lockable and provide adequate access to components requiring maintenance. Instruments, control, and battery system shall be mounted within enclosure.

B. Construction:

1. Louvers: Equipped with bird screen to permit air circulation when engine is not running while excluding birds and rodents.

2. Hinged Doors: With padlocking provisions. Restraint/Hold back hardware to prevent door to keep door open at 180 degrees during maintenance. Rain lips over all doors.

3. Exhaust System:

a. Muffler Location: Within enclosure.

4. Hardware: All hardware and hinges shall be stainless steel.

5. Mounting Base: Suitable for mounting on sub-base fuel tank or housekeeping pad.

6. A weather protective enclosure shall be provided which allows the generator set to operate at full rated load with a static pressure drop equal to or less than 0.5 inches of water.

C. Engine Cooling Airflow through Enclosure: Housing shall provide ample airflow for engine generator operation at rated load in an ambient temperature of 40 deg C.

1. Louvers: Fixed-engine, cooling-air inlet and discharge.

2. Motorized Louvers: At engine cooling-air inlet and discharge. Dampers shall be closed to reduce enclosure heat loss in cold weather when unit is not operating. Dampers shall be of a “fail open” design to allow airflow in the event of failure

D. Sound Performance: Reduce the sound level of the engine generator while operating at full rated load to a maximum of 61 dBA measured at any location 75 ft from the engine generator in a free field environment.

E. Electrical Provisions

1. Compliance with NEC: Package shall comply with the requirements of the National Electrical Code for all wiring materials and component spacing.

2. Provide an internally mounted and wired electrical distribution panel to serve the engine generator and enclosure; including:

a. 100 amp distribution panelboard connected to a 120/240VAC utility service by the installer.

b. Two duplex GFI receptacles, one inside the enclosure, and a weatherproof receptacle on the outside of the enclosure.

c. Factory wired normal AC service from the panelboard to the engine coolant heater, alternator heater, and battery charger.

d. Interior Lights with Switch: Two three-way switches controlling three AC lamps mounted in vapor tight and gasketed fixtures

3. External Electrical Connections: All power and control interconnections shall be made within the perimeter of the enclosure.

F. Site Provisions:

1. Lifting: Complete assembly of engine generator, enclosure, and sub base fuel tank (when used) shall be designed to be lifted into place as a single unit, using spreader bars.

2.9 VIBRATION ISOLATION DEVICES

A. Vibration Isolation: Generators installed on grade shall be provided with elastomeric isolator pads integral to the generator, unless the engine manufacturer requires use of spring isolation.

2.10 FINISHES

A. Indoor and Outdoor Enclosures and Components: Powder-coated and baked over corrosion-resistant pretreatment and compatible primer. Manufacturer's standard color or as directed on the drawings.

2.11 SOURCE QUALITY CONTROL

A. Prototype Testing: Factory test engine-generator set using same engine model, constructed of identical or equivalent components and equipped with identical or equivalent accessories.

1. Tests: Comply with NFPA 110, Level 1 Energy Converters. In addition, the equipment engine, skid, cooling system, and alternator shall have been subjected to actual prototype tests to validate the capability of the design under the abnormal conditions noted in NFPA110. Calculations and testing on similar equipment which are allowed under NFPA110 are not sufficient to meet this requirement.

B. Project-Specific Equipment Tests: Before shipment, factory test engine-generator set manufactured specifically for this Project. Perform tests at rated load and power factor. Include the following tests:

1. Test engine generator set manufactured for this Project to demonstrate compatibility and functionality.

2. Full load run.

3. Maximum power.

4. Voltage regulation.

5. Steady-state governing.

6. Single-step load pickup.

7. Simulated safety shutdowns.

C. Provide 14 days' advance notice of tests and opportunity for observation of tests by Owner's representative.

2.12 GENERATOR PLATFORM

1. Provide generator platform for access to side enclosure doors. Generator platform shall consist of steel frame with diamond plate top and aluminum handrails. Platforms shall be three-sided with two stair access. Platform shall be 52” deep and as indicated on the electrical drawings.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Comply with packaged engine-generator manufacturers' written installation, application, and alignment instructions and with NFPA 110.

B. Equipment shall be installed by the contractor in accordance with final submittals and contract documents. Installation shall comply with applicable state and local codes as required by the authority having jurisdiction. Install equipment in accordance with manufacturer's instructions and instructions included in the listing or labeling of UL listed products.

C. Installation of equipment shall include furnishing and installing all interconnecting wiring between all major equipment provided for the on-site power system. The contractor shall also perform interconnecting wiring between equipment sections (when required), under the supervision of the equipment supplier.

D. Equipment shall be installed on concrete housekeeping pads. Equipment shall be permanently fastened to the pad in accordance with manufacturer’s instructions and seismic requirements of the site.

E. Equipment shall be initially started and operated by representatives of the manufacturer. All protective settings shall be adjusted as instructed by the consulting engineer.

F. All equipment shall be physically inspected for damage. Scratches and other installation damage shall be repaired prior to final system testing. Equipment shall be thoroughly cleaned to remove all dirt and construction debris prior to initial operation and final testing of the system.

G. On completion of the installation by the electrical contractor, the generator set supplier shall conduct a site evaluation to verify that the equipment is installed per manufacturer’s recommended practice.

3.2 ON-SITE ACCEPTANCE TEST

A. The complete installation shall be tested to verify compliance with the performance requirements of this specification following completion of all site work. Testing shall be conducted by representatives of the manufacturer, with required fuel supplied by Contractor. The Engineer shall be notified in advance and shall have the option to witness the tests. The generator set manufacturer shall provide a site test specification covering the entire system. Tests shall include:

B. Prior to start of active testing, all field connections for wiring, power conductors, and bus bar connections shall be checked for proper tightening torque.

C. Installation acceptance tests to be conducted on site shall include a "cold start" test, a two hour full load (resistive) test, and a one-step rated load pickup test in accordance with NFPA 110. Provide a resistive load bank and make temporary connections for full load test, if necessary.

D. Perform a power failure test on the entire installed system. This test shall be conducted by opening the power supply from the utility service, and observing proper operation of the system for at least 2 hours. Coordinate timing and obtain approval for start of test with site personnel.

E. Perform sound level measurements after completion of all construction to determine if the generator sound levels are consistent with manufacturer’s data. The contractor shall provide written test report performed by a certified sound engineering firm to verify the generator sound levels are in accordance with paragraph 2.8 B, Baltimore City Sound regulations. Sound measurements are to be at a minimum of three locations. Test shall be performed by calibrated Field Sound Transmission Classification (STC) Instrumentation per ASTM and ANSI standards

3.3 TRAINING

A. The equipment supplier shall provide training for the facility operating personnel covering operation and maintenance of the equipment provided. The training program shall be not less than 4 hours in duration and the class size shall be limited to 5 persons. Training date shall be coordinated with the facility owner.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

3.5 SERVICE AND SUPPORT

A. The generator set supplier shall maintain service parts inventory for the entire power system at a central location which is accessible to the service location 24 hours per day, 365 days per year. The inventory shall have a commercial value of $3 million or more. The manufacturer of the generator set shall maintain a central parts inventory to support the supplier, covering all the major components of the power system, including engines, alternators, control systems, paralleling electronics, and power transfer equipment.

B. The generator set shall be serviced by a local service organization that is trained and factory certified in generator set service. The supplier shall maintain an inventory of critical power system replacement parts in the local service location. Service vehicles shall be stocked with critical replacement parts. The service organization shall be on call 24 hours per day, 365 days per year. The service organization shall be physically located within 50 of the site.

C. The manufacturer shall maintain model and serial number records of each generator set provided for at least 20 years.

END OF SECTION 26 31 13

SECTION 26 33 53 - THREE-PHASE UNINTERRUPTIBLE POWER SYSTEM 120/208VAC SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

A. This specification defines the electrical and mechanical characteristics and requirements for a continuous- duty three-phase, solid-state, scalable (field-upgradable) uninterruptible power system (UPS). The UPS shall provide high-quality AC power for sensitive electronic equipment.

B. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.2 STANDARDS

A. The UPS shall be designed in accordance with the applicable sections of the current revision of the following documents. Where a conflict arises between these documents and statements made herein, the statements in this specification shall govern.

1. UL Standard 1778
2. CSA 22.2, No. 107.1
3. FCC Part 15, Class A
4. IEC 61000-4-5
5. National Electrical Code (NFPA-70)
6. NEMA PE-1
7. ISTA_1H

B. The UPS shall be UL and cUL listed per UL Standard 1778.

1.3 SYSTEM DESCRIPTION

A. Design Requirements - UPS Module

1. Voltage. Input/output voltage specifications of the UPS shall be:
2. Rectifier Input: 120/208 volts, three-phase, 4-wire-plus-ground
3. Bypass Input: 120/208 volts, three-phase, 4-wire-plus-ground
4. Output: 120/208 volts, three-phase, 4-wire-plus-ground

B. Output Load Capacity. Specified output load capacity of the UPS shall be 33.3 kVA at 0.9 lagging power factor.

C. Scalable Output Capacity. UPS rated output capacity will be scalable by means of a software update which will require no hardware modifications to the UPS. Models will be available in capacity ranges of 40, 60, 80, 100, 120, 160 and 200kVA.

1. 40kVA model will be scalable from 40k to 60kVA to 80kVA.
2. 80kVA model will be scalable from 80kVA to 100kVA to 120kVA.
3. 160kVA model will be scalable from 160kVA to 200kVA

D. Parallel Operation. Up to four (4) UPS module outputs may be connected together in parallel to provide up to 3X maximum output capacity with redundancy.

E. Current Sharing: When multiple UPS modules are connected in parallel and powering a common load, each UPS module output current will not differ by more than 5% of the rated full load current of one UPS module.

F. Design Requirements - Battery

1. Battery Cells: Valve-regulated, lead acid batteries.
2. Reserve Time: 30 minutes at 26.6kVA, 0.9 power factor, with ambient temperature of 77°F (25°C). Unit shall provide terminal for connection of external batteries.
3. Recharge Time: to 95% capacity within ten (10) times discharge time.

G. Modes of Operation

1. The UPS shall be designed to operate as an on-line, double-conversion, reverse-transfer system with the following operating modes:
   a. Normal - The critical AC load is continuously supplied by the UPS inverter. The rectifier/charger derives power from an AC source and supplies DC power to the inverter while simultaneously float-charging the reserve battery.
   b. Emergency - Upon failure of utility AC power, the critical AC load is supplied by the inverter, which obtains power from the battery. There shall be no interruption in power to the critical load upon failure or restoration of the utility AC source.
   c. Recharge - Upon restoration of utility AC power after a utility AC power outage, the rectifier/charger shall automatically restart and assume the inverter and battery recharge loads.
   d. Bypass - If the UPS must be taken out of service for maintenance or repair or if the inverter overload capacity is exceeded, the static transfer switch shall perform a reverse transfer of the load from the inverter to the bypass source with no interruption in power to the critical AC load.
   e. Eco-Mode - When this mode is enabled by service personnel the UPS will power the critical load through the UPS static bypass. If the bypass source becomes unqualified the UPS will switch to Normal mode of operation as defined above. Utility power is considered unqualified when either the input voltage varies more than +10% of rated voltage or the input frequency varies beyond +10% of 60Hz. Ten (10) minutes after the bypass source becomes qualified the UPS will automatically transfer to Eco-Mode of operation.

H. Performance Requirements

1. AC Input to UPS
   a. Voltage Configuration for Standard Units: 480V, three-phase, three-wire plus ground
   b. Voltage Range: +15%, -20% of nominal without derating
   c. Frequency: 57-66 Hz
   d. Power Factor: >0.99 at nominal input voltage and full-rated UPS output load
   >0.98 at nominal input voltage and half-rated UPS output load
   e. Inrush Current: UPS inrush current not to exceed 1.5 times rated input current. Maintenance bypass and distribution cabinet inrush current not to exceed 8 times rated input current.
   f. Current Limit: 140% of nominal AC input current maximum
   g. Current Distortion: <3% reflected THD maximum at full load
   h. Surge Protection: Sustains input surges without damage per criteria listed in IEC 1000-4-5

I. AC Output, UPS Inverter

1. Voltage Configuration: three-phase, 3-wire plus ground

2. Voltage Regulation:±1% three-phase RMS average for a balanced three-phase load for the combined variation effects of input voltage, connected load, battery voltage, ambient temperature and load power factor±2% three-phase RMS average for a 100% unbalanced load for the combined variation effects of input voltage, connected load, battery voltage, ambient temperature and load power factor
3. Frequency: Nominal frequency ±0.05% for single unit ±0.25% for paralleled units
4. Frequency Slew Rate: Selectable from 0.1Hz/sec to 3.0Hz/sec maximum for single unit
   Fixed maximum of 0.2Hz/sec for paralleled units
5. Phase Displacement: ±0.5 degree for balanced load ,±1.0 degrees for 100% unbalanced load
6. Bypass Line Sync Range: ±2.0 Hz, field-selectable ±0.5 to 5.0 Hz
7. Voltage Distortion: 1% total harmonic distortion (THD) for linear loads,
   <5% THD for 100% nonlinear loads (3:1 crest factor) without kVA/kW derating
8. Load Power Factor Range: 0.7 lagging to 1.0 leading without derating
9. Output Power Rating: Rated kVA at 0.9 lagging power factor
10. Overload Capability:
    a. 110% for 1 hour
    b. 125% for 10 minutes
    c. 150% for 1 minute
11. Voltage Transient Response: 100% load step, ±5.0%, Loss or return of AC input power, ±1.0%
12. Transient Recovery Time: to within 2% of output voltage within one cycle
13. Voltage Unbalance: 100% unbalanced load, ±2%

1.4 ENVIRONMENTAL CONDITIONS

A. The UPS shall be able to withstand the following environmental conditions without damage or degradation of operating characteristics:

1. Operating Ambient Temperature
   a. UPS Module: 32°F to 104°F (0°C to 40°C)
   b. Battery: 77°F ±9°F (25°C ±5°C)
2. Storage/Transport Ambient Temperature
   a. UPS Module: -13°F to 158°F (-25°C to 70°C)
   b. Battery: -4°F to 92°F (-20°C to 33°C)
3. Relative Humidity: 0 to 95%, non-condensing
4. Altitude
   a. Operating: to 6,562 ft. (2000m) above mean sea level without derating. Linearly derated from 100% load at 6,562 ft. (2000m) to 88% load at 9,843 ft. (3000m).
   b. Storage/Transport: to 40,000 ft. (12,200m) above mean sea level.
5. Audible Noise
   a. Less than 61dB for 40-80kVA model
   b. Less than 63dB for 100-120kVA model
   c. Less than 69dB for 160-200kVA model

1.5 SUBMITTALS

A. Proposal Submittals

1. Submittals with the proposal shall include:

a. System configuration with single-line diagrams

b. Functional relationship of equipment including weights, dimensions and heat dissipation

c. Descriptions of equipment to be furnished, including deviations from these specifications

d. Size and weight of shipping units to be handled by installing contractor

e. Detailed layouts of customer power and control connections

f. Detailed installation drawings including all terminal locations

B. UPS Delivery Submittals

1. Submittals upon UPS delivery shall include a complete set of submittal drawings and one (1) set of instruction manuals that shall include a functional description of the equipment with block diagrams, safety precautions, instructions, step-by-step operating procedures and routine maintenance guidelines, including illustrations.

1.6 WARRANTY

A. UPS Module

1. The UPS manufacturer shall warrant the UPS module against defects in materials and workmanship for 24 months after initial startup..

B. Battery

1. The battery manufacturer's standard warranty shall be passed through to the end user.

1.7 QUALITY ASSURANCE

A. Manufacturer Qualifications

1. A minimum of 20 years' experience in the design, manufacture and testing of solid-state UPS systems is required. The system shall be designed and manufactured according to world-class quality standards. The manufacturer shall be ISO 9001:2000 certified.

B. Factory Testing

1. Before shipment, the manufacturer shall fully and completely test the system to assure compliance with the specification.

PART 2 - PRODUCT

2.1 FABRICATION

A. Materials

1. All materials of the UPS shall be new, of current manufacture and high grade and shall not have been in prior service except as required during factory testing. All active electronic devices shall be solid-state. All power semi-conductors shall be sealed. Control logic and fuses shall be physically isolated from power train components to ensure operator safety and protection from heat. All electronic components shall be accessible from the front without removing sub-assemblies for service access.

B. Wiring

1. Wiring practices, materials and coding shall be in accordance with the requirements of the National Electrical Code, OSHA and applicable local codes and standards. All bolted connections of busbars, lugs and cables shall be in accordance with requirements of the National Electrical Code and other applicable standards. All electrical power connections shall be torqued to the required value and marked with a visual indicator.
2. Provisions shall be made in the cabinets to permit installation of input, output and external control cabling, using raceway or conduit. Provision shall be made for top and bottom access to input, output, bypass and DC connections. In conformance with NEC, connection cabinets shall provide for adequate wire bend radius. All copper busbars for customer power connections shall be tin plated for connection integrity.

C. Construction and Mounting

1. The UPS shall be in NEMA Type 1 enclosures, designed for floor mounting. The UPS shall be structurally adequate and have provisions for hoisting, jacking and forklift handling. Maximum cabinet height shall be 78.7 in. (2000mm).

D. Cooling

1. Cooling of the UPS shall be by forced air using a redundant fan configuration. Fan power shall be provided by the UPS.
2. The thermal design, along with all thermal and ambient sensors, shall be coordinated with the protective devices before excessive component or internal cabinet temperatures are exceeded. Air filters shall be located at the point of air inlet and be changeable.

2.2 COMPONENTS

Rectifier/Charger

A. General

1. The term rectifier/charger shall denote the solid-state equipment and controls necessary to convert AC to regulated DC for input to the inverter and for charging the battery.

B. AC Input Current Limiting

1. The rectifier/charger unit shall be provided with AC input current limiting whereby the maximum input current shall be limited to 140% of the full input current rating. Input current limit will be adjustable by service personnel to allow the UPS to be used with undersized feeder breakers.

C. DC Filter

1. The rectifier/charger shall have an output filter to minimize ripple current into the battery. The AC ripple voltage of the rectifier DC output shall not exceed 1% RMS of the float voltage. The filter shall be adequate to ensure that the DC output of the rectifier/charger will meet the input requirements of the inverter without the battery connected.

D. Automatic Rectifier Restart

1. Upon restoration of utility AC power, after a utility AC power outage and prior to a UPS automatic end-of-discharge shutdown, the rectifier/charger shall automatically restart and assume the inverter and battery recharge loads.

E. Battery Recharge

1. In addition to supplying power for the inverter load, the rectifier/charger shall be capable of producing battery charging current sufficient to replace 95% of the battery discharge power

within ten (10) times the discharge time. After the battery is recharged, the rectifier/charger shall maintain the battery at full charge until the next emergency operation.

F. Overvoltage Protection

1. There shall be DC overvoltage protection so that if the DC voltage rises to the preset limit, the UPS will shut down automatically and initiate an uninterrupted load transfer to the static bypass line.

2.3 INVERTER

A. General

1. The term inverter shall denote the equipment and controls to convert DC from the rectifier/charger or battery to precise AC to power the load. The inverter shall be solid-state, capable of providing rated output power, and for increased performance the inverter shall be a pulse-width-modulated design and utilize insulated gate bipolar transistors (IGBTs).

B. Overload Capability

1. The inverter shall be capable of supplying current and voltage for overloads exceeding 100%. The inverter is to provide 150% of full load for 1 minute, 125% of full load for 10 minutes and 110% of full load for 1 hour. A status indicator and audible alarm shall indicate overload operation. The UPS shall transfer the load to bypass when overload capacity is exceeded.

C. Fault Clearing and Current Limit

1. The inverter shall be capable of supplying an overload current of 150% of its full-load rating for one minute. For greater currents or longer time duration, the inverter shall have electronic current-limiting protection to prevent damage to components. The critical load will be transferred to the static bypass automatically and uninterrupted. The inverter shall be self-protecting against any magnitude of connected output overload. Inverter control logic shall sense and disconnect the inverter from the critical AC load without the requirement to clear protective fuses.

2.4 STEP LOAD RESPONSE

A. Voltage Distortion

1. Total harmonic distortion in the output voltage will not exceed 1% for 0% to 100% linear loads.
2. Total harmonic distortion in the output voltage will not exceed 4% for 0% to 100% non-linear loads.
3. Total harmonic distortion in the output voltage will not exceed 5% for 0% to 100% non-linear, unbalanced loads.

B. Phase Balance

1. Electronic controls shall be provided to regulate each phase so that an unbalanced loading will not cause the output voltage to go outside the specified voltage unbalance or phase displacement. With 100% load on one phase (and 0% load on the other two phases) or 100% load on two phases (and 0% load on the other phase), the voltage balance is to be within 2% and the phase displacement is to be 120 degrees within ±1.5 degrees.

C. Inverter Shutdown

1. For rapid removal of the inverter from the critical load, the inverter control electronics shall instantaneously turn off the inverter transistors. Simultaneously, the static transfer switch shall be turned on to maintain continuous power to the critical load.

D. Inverter DC Protection

1. The inverter shall be protected by the following disconnect levels:
   a. DC Overvoltage Shutdown
   b. DC Undervoltage Warning (Low Battery Reserve)—pre-warning time is adjustable
   c. DC Undervoltage Shutdown (End of Discharge)

E. Output Frequency

1. The output frequency of the inverter shall be controlled by a high-speed DSP capable of holding the inverter output frequency to within ±0.05% during steady state and transient conditions. Total deviation from the rated frequency, including short time fluctuations and drift, shall not exceed 0.05%.

2.5 DISPLAY AND CONTROLS

A. Monitoring and Control

1. The UPS shall be provided with a microprocessor-based unit status display and controls section designed for convenient and reliable user operation. A graphical liquid crystal display (LCD) shall be used to show a single-line diagram of the UPS and shall be provided as part of the monitoring and controls sections of the UPS. All operator controls and monitors shall be located on the front of the UPS cabinet. Monitoring functions such as metering, status and alarms shall be displayed on the graphical LCD. Additional features of the monitoring system shall include:
   a. Menu-driven display with pushbutton navigation
   b. Real-time clock (time and date)
   c. Alarm history with time and date stamp
   d. Memory with battery backup

B. Metering

1. The following parameters shall be displayed:
   a. Input AC voltage line-to-line
   b. Input AC current for each phase
   c. Input frequency
   d. Battery voltage
   e. Battery charge/discharge current
   f. Output AC voltage line-to-line
   g. Output AC current for each phase
   h. Output frequency
   i. Apparent power
   j. Active power
   k. Battery time left during battery operation

C. Selectable Input Contacts

1. The UPS shall have these available selectable input contacts:
   a. On Generator
   b. Fast Power Off
   c. MBB Auxiliary Contacts
   d. Start Battery Test
   e. Fault Acknowledge
   f. Bypass and Inverter Off

g. Stop Battery Test

D. Alarm Messages

1. The following alarm messages shall be displayed:
   a. Mains Voltage Abnormal
   b. Mains Undervoltage
   c. Mains Freq. Abnormal
   d. Charger Fault
   e. Battery Reversed
   f. No Battery
   g. Control Power 1 Fail
   h. Parallel Comm. Fail
   i. Bypass Unable To Track
   k. Bypass Abnormal
   l. Inverter Asynchronous
   m. Fan Fault
   n. Control Power 2 Fail
   o. Unit Over Load
   p. System Over Load
   q. Bypass Phase Reversed
   r. Transfer Time-Out
   s. Load Sharing Fault
   t. Parallel Connect Fault
   u. Bypass Over Current
   v. Output Ground Fault

E. Status Messages

1. The following UPS status messages shall be displayed:
   a. Rectifier (Off / Soft Start / Main Input On / Battery Input On)
   b. Input Supply (Normal Mode / Battery Mode / All Off)
   c. Battery Self Test (True / False)
   d. Input Disconnect (Open / Closed)
   e. EPO (True / False)
   f. Charger (On / Off)
   g. Output Disconnect (Open / Closed)
   h. Maint. Disconnect (Open / Closed)
   i. Bypass Disconnect (Open / Closed)
   j. Inverter (Off / Soft Start / On)
   k. Bypass (Normal / Unable To Trace / Abnormal)
   l. Output Supply (All Off / Bypass Mode / Inverter Mode / Output Disable)
   m. Inverter On (Enable / Disable)

F. Controls

1. UPS startup, shutdown and maintenance bypass operations shall be accomplished through pushbutton controls on the front panel. Menu-driven user prompts shall be provided to guide the operator through system operation without the use of additional manuals. Pushbuttons shall be provided to display the status of the UPS and to test and reset visual and audible

alarms. A mimic screen shall be available on the LCD to depict a single-line diagram of the UPS with switch positions and power flow.

G. On-Line Battery Test

1. The UPS shall be provided with a menu-driven On-Line Battery Test feature. The test shall ensure the capability of the battery to supply power to the inverter while the load is supplied power in the normal mode.

2.6 STATIC TRANSFER SWITCH

A. General

1. A static transfer switch and bypass circuit shall be provided as an integral part of the UPS. The static switch shall be a naturally commutated high-speed static (SCR-type) device rated to conduct full load current continuously. The switch shall have an overload rating to clear a 20-ampere load branch circuit breaker.

2. The static transfer switch control logic shall contain an automatic transfer control circuit that senses the status of the inverter logic signals and operating and alarm conditions. This control circuit shall provide an uninterrupted transfer of the load to an alternate bypass source without exceeding the transient limits specified herein, when an overload or malfunction occurs within the UPS or to bypass the UPS for maintenance.

B. Uninterrupted Transfer

1. The transfer control logic shall automatically turn on the static transfer switch, transferring the critical AC load to the bypass source, after the transfer logic senses any of the following conditions:
   a. Inverter overload capacity exceeded
   b. Critical AC load overvoltage or undervoltage
   c. UPS fault condition

2. The transfer control logic shall inhibit an automatic transfer of the critical load to the bypass source if any of the following conditions are present:
   a. Bypass frequency out of limits
   b. Bypass out-of-synchronization range with inverter output

C. Uninterrupted Retransfer

1. Retransfer of the critical AC load from the bypass source to the inverter output shall be automatically initiated unless inhibited by manual control. The transfer control logic shall inhibit an automatic retransfer of the critical load to the inverter if one of the following conditions exists:
   a. Bypass out of synchronization range with inverter output
   b. Inverter/bypass voltage difference exceeding preset limits
   c. Overload condition exists in excess of inverter full load rating
   d. UPS fault condition present

2.7 MAINTENANCE BYPASS SWITCH

A. General

1. A manually operated maintenance bypass switch shall be incorporated into the UPS cabinet to directly connect the critical load to the bypass AC input power source, bypassing the rectifier/charger, inverter and static transfer switch.

B. Battery Cabinet

1. The battery cabinet shall include ten (10) year design life, valve-regulated, lead-acid battery cells housed in a separate cabinet that matches the UPS cabinet styling to form an integral system lineup. All battery cell inter-connects shall utilize bolted connections, and all batteries shall include copper, inserted terminal posts allowing connector torque of 110 in-lb (12.4 Nm). Battery cells shall be mounted on slide-out trays for ease of maintenance. A battery disconnect circuit breaker shall be included for isolation of the battery pack from the UPS module. Casters and leveling feet shall also be provided with the battery cabinet for ease of installation. When the application calls for the battery cabinet to be bolted to the UPS cabinet, an interconnecting cable kit will be available, precut and pre-lugged.

2.8 ACCESSORIES

A. Liebert IntelliSlot® Web Card (ISWEB-LB)

1. Provides communication outputs to indicate a change of status of the UPS. Outputs are provided for:
   a. SNMP
   b. HTML - Web page
   c. .Allow use of Liebert Nform™ and or network management systems

B. Matching Maintenance Bypass and Distribution Cabinet

1. A make-before-break maintenance bypass with Solenoid Key Release Unit (SKRU) interlock shall be available in a cabinet that matches and may be bolted up to the UPS. Installation of the cabinet shall not affect the cooling ability of the UPS. Thermal-magnetic breakers shall be provided for bypass and maintenance isolation.

C. Remote Alarm Panel

1. The remote alarm panel shall have LED alarm lights. An audible alarm shall sound upon any alarm condition. The surface- or flush-mounted NEMA 1 enclosed panel shall indicate:
   a. Load on UPS LED
   b. Load on Bypass LED
   c. Battery Discharging LED
   d. Low Battery Warning LED
   e. UPS Alarm Condition LED
   f. New Alarm Condition LED (For a Second UPS Alarm Condition)
   g. Audible Alarm with Reset pushbutton
   h. Lamp Test/Reset pushbutton

PART 3 - EXECUTION

3.1 TRAINING

A. The Contractor shall provide a training session for up to five (5) owner's representatives for 2 normal workdays at a job site location determined by the owner.

B. The training session shall be conducted by a manufacturer's qualified representative. The training program shall consist of the instruction on the operation of the assembly, circuit breakers, and major components within the assembly.

3.2 FIELD QUALITY CONTROL

A. The following inspections and test procedures shall be performed by factory-trained field service personnel during the UPS startup.

B. Visual Inspection

1. Inspect equipment for signs of damage.
2. Verify installation per drawings.
3. Inspect cabinets for foreign objects.
4. Verify neutral and ground conductors are properly sized and configured.
5. Inspect battery cases.
6. Inspect battery for proper polarity.
7. Verify all printed circuit boards are configured properly.

C. Mechanical Inspection

1. Check all control wiring connections for tightness.
2. Check all power wiring connections for tightness.
3. Check all terminal screws, nuts and/or spade lugs for tightness.

D. Electrical Inspection

1. Check all fuses for continuity.
2. Confirm input voltage and phase rotation is correct.
3. Assure connection and voltage of the battery string(s).

3.3 MANUFACTURER'S FIELD SERVICE

A. Service Personnel

1. The UPS manufacturer shall directly employ a nationwide service organization consisting of factory-trained field service personnel dedicated to the startup and maintenance of UPS and power equipment.
2. The manufacturer shall provide a national dispatch center to coordinate field service personnel schedules. One toll-free number shall reach a qualified support person 24 hours a day, 7 days a week, 365 days a year. If emergency service is required, on-site response time shall be four hours or less within 150 miles of an Emerson Network Power Liebert Services center.
3. Two local customer engineers shall be assigned to the site with a regional office as a backup. Escalation procedures shall be in place to notify Power Technical Support if a site is not functioning within 24 hours.

B. Replacement Parts Stocking

1. Parts shall be available through an extensive network to ensure round-the-clock parts availability throughout the country.
2. Spare parts shall be stocked by local field service personnel with backup available from national parts center and the manufacturing location. A national parts center Customer Support Parts Coordinator shall be on call 24 hours a day, 7 days a week, 365 days a year for immediate parts availability.

C. Maintenance Contracts

1. A complete offering of preventive and full-service maintenance contracts for both the UPS system and battery system shall be available.

D. Automated Site Monitoring

1. The UPS manufacturer shall provide as an option an automated site-monitoring service. This service shall be staffed by a qualified support person 24 hours a day, 7 days a week, 365 days a year. At the detection of an alarm within the UPS, the controls shall initiate communications with the monitoring service. The monitoring service shall be capable of interpreting the communicated alarms to allow dispatch of a service engineer.

END OF SECTION 26 33 53

SECTION 26 33 54 – THREE- PHASE UNINTERRUPTIBLE POWER SYSTEM 277/480VAC SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

A. This specification defines the electrical and mechanical characteristics and requirements for a continuous-duty three-phase, solid-state, scalable (field-upgradable) uninterruptible power system (UPS). The UPS shall provide high-quality AC power for sensitive electronic equipment.

B. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.2 STANDARDS

A. The UPS shall be designed in accordance with the applicable sections of the current revision of the following documents. Where a conflict arises between these documents and statements made herein, the statements in this specification shall govern.

1. UL Standard 924.
2. CSA 22.2, No. 107.1
3. FCC Part 15, Class A
4. IEC 61000-4-5
5. National Electrical Code (NFPA-70)
6. NEMA PE-1
7. ISTA_1H

B. The UPS shall be UL and cUL listed per UL Standard 1778.

1.3 SYSTEM DESCRIPTION

A. Design Requirements - UPS Module

1. Voltage. Input/output voltage specifications of the UPS shall be:
2. Rectifier Input: 277/480 volts, three-phase, 4-wire-plus-ground
3. Bypass Input: 277/480 volts, three-phase, 4-wire-plus-ground
4. Output: 277/480 volts, three-phase, 4-wire-plus-ground

B. Output Load Capacity. Specified output load capacity of the UPS shall be 24KW.

C. Scalable Output Capacity. UPS rated output capacity will be scalable by means of a software update which will require no hardware modifications to the UPS. Models will be available in capacity ranges of 40, 60, 80, 100, 120, 160 and 200kVA.

40kVA model will be scalable from 40k to 60kVA to 80kVA.

80kVA model will be scalable from 80kVA to 100kVA to 120kVA.

160kVA model will be scalable from 160kVA to 200kVA

D. Parallel Operation. Up to four (4) UPS module outputs may be connected together in parallel to provide up to 3X maximum output capacity with redundancy.

E. Current Sharing: When multiple UPS modules are connected in parallel and powering a common load, each UPS module output current will not differ by more than 5% of the rated full load current of one UPS module.

F. Design Requirements - Battery

1. Battery Cells: Valve-regulated, lead acid batteries.
2. Reserve Time: 90 minutes, with ambient temperature of 77°F (25°C). Unit shall provide terminal for connection of external batteries.
3. Recharge Time: to 95% capacity within ten (10) times discharge time.

G. Modes of Operation

1. The UPS shall be designed to operate as an on-line, double-conversion, reverse-transfer system with the following operating modes:

a. Normal - The critical AC load is continuously supplied by the UPS inverter. The rectifier/charger derives power from an AC source and supplies DC power to the inverter while simultaneously float-charging the reserve battery.

b. Emergency - Upon failure of utility AC power, the critical AC load is supplied by the inverter, which obtains power from the battery. There shall be no interruption in power to the critical load upon failure or restoration of the utility AC source.

c. Recharge - Upon restoration of utility AC power after a utility AC power outage, the rectifier/charger shall automatically restart and assume the inverter and battery recharge loads.

d. Bypass - If the UPS must be taken out of service for maintenance or repair or if the inverter overload capacity is exceeded, the static transfer switch shall perform a reverse transfer of the load from the inverter to the bypass source with no interruption in power to the critical AC load.

e. Eco-Mode - When this mode is enabled by service personnel the UPS will power the critical load through the UPS static bypass. If the bypass source becomes unqualified the UPS will switch to Normal mode of operation as defined above. Utility power is considered unqualified when either the input voltage varies more than +10% of rated voltage or the input frequency varies beyond +10% of 60Hz. Ten (10) minutes after the bypass source becomes qualified the UPS will automatically transfer to Eco-Mode of operation.

H. Performance Requirements

1. AC Input to UPS

a. Voltage Configuration for Standard Units: 480V, three-phase, three-wire plus ground

b. Voltage Range: +15%, -20% of nominal without derating

c. Frequency: 57-66 Hz

d. Power Factor: >0.99 at nominal input voltage and full-rated UPS output load,
>0.98 at nominal input voltage and half-rated UPS output load

e. Inrush Current: UPS inrush current not to exceed 1.5 times rated input current. Maintenance bypass and distribution cabinet inrush current not to exceed 8 times rated input current.

f. Current Limit: 140% of nominal AC input current maximum

g. Current Distortion: <3% reflected THD maximum at full load

h. Surge Protection: Sustains input surges without damage per criteria listed in IEC 1000-4-5

2. AC Output, UPS Inverter

a. Voltage Configuration: three-phase, 3-wire plus ground

b. Voltage Regulation:

i. ±1% three-phase RMS average for a balanced three-phase load for the combined variation effects of input voltage, connected load, battery voltage, ambient temperature and load power factor

ii. ±2% three-phase RMS average for a 100% unbalanced load for the combined variation effects of input voltage, connected load, battery voltage, ambient temperature and load power factor

3. Frequency: Nominal frequency ±0.05% for single unit, ±0.25% for paralleled units

4. Frequency Slew Rate: Selectable from 0.1Hz/sec to 3.0Hz/sec maximum for single unit; Fixed maximum of 0.2Hz/sec for paralleled units

5. Phase Displacement:

a. ±0.5 degree for balanced load

b. ±1.0 degrees for 100% unbalanced load

6. Bypass Line Sync Range:

a. ±2.0 Hz, field-selectable ±0.5 to 5.0 Hz

7. Voltage Distortion:

a. 1% total harmonic distortion (THD) for linear loads

b. <5% THD for 100% nonlinear loads (3:1 crest factor) without kVA/kW derating

8. Load Power Factor Range: 0.7 lagging to 1.0 leading without derating

9. Output Power Rating: Rated kVA at 0.9 lagging power factor

10. Overload Capability:

a. 110% for 1 hour

b. 125% for 10 minutes

c. 150% for 1 minute

11. Voltage Transient Response:

100% load step	±5.0%
Loss or return of AC input power	±1.0%

12. Transient Recovery Time: to within 2% of output voltage within one cycle

13. Voltage Unbalance: 100% unbalanced load, ±2%

1.4 ENVIRONMENTAL CONDITIONS

A. The UPS shall be able to withstand the following environmental conditions without damage or degradation of operating characteristics:

1. Operating Ambient Temperature

a. UPS Module: 32°F to 104°F (0°C to 40°C)

b. Battery: 77°F ±9°F (25°C ±5°C)

2. Storage/Transport Ambient Temperature

a. UPS Module: -13°F to 158°F (-25°C to 70°C)

b. Battery: -4°F to 92°F (-20°C to 33°C)

3. Relative Humidity 0 to 95%, non-condensing

4. Altitude

a. Operating: to 6,562 ft. (2000m) above mean sea level without derating. Linearly derated from 100% load at 6,562 ft. (2000m) to 88% load at 9,843 ft. (3000m).

b. Storage/Transport: to 40,000 ft. (12,200m) above mean sea level.

5. Audible Noise

a. Less than 61dB for 40-80kVA model

b. Less than 63dB for 100-120kVA model

c. Less than 69dB for 160-200kVA model

1.5 SUBMITTALS

A. Proposal Submittals

1. Submittals with the proposal shall include:

a. System configuration with single-line diagrams

b. Functional relationship of equipment including weights, dimensions and heat dissipation

c. Descriptions of equipment to be furnished, including deviations from these specifications

d. Size and weight of shipping units to be handled by installing contractor

e. Detailed layouts of customer power and control connections

f. Detailed installation drawings including all terminal locations

B. UPS Delivery Submittals

1. Submittals upon UPS delivery shall include a complete set of submittal drawings and one (1) set of instruction manuals that shall include a functional description of the equipment with block diagrams, safety precautions, instructions, step-by-step operating procedures and routine maintenance guidelines, including illustrations.

1.6 WARRANTY

A. UPS Module

1. The UPS manufacturer shall warrant the UPS module against defects in materials and workmanship for 24 months after initial startup.

B. Battery

1. The battery manufacturer's standard warranty shall be passed through to the end user.

1.7 QUALITY ASSURANCE

A. Manufacturer Qualifications

1. A minimum of 20 years' experience in the design, manufacture and testing of solid-state UPS systems is required. The system shall be designed and manufactured according to world-class quality standards. The manufacturer shall be ISO 9001:2000 certified.

B. Factory Testing

1. Before shipment, the manufacturer shall fully and completely test the system to assure compliance with the specification.

PART 2 - PRODUCT

2.1 FABRICATION

A. Materials

1. All materials of the UPS shall be new, of current manufacture and high grade and shall not have been in prior service except as required during factory testing. All active electronic devices shall be solid-state. All power semi-conductors shall be sealed. Control logic and fuses shall be physically isolated from power train components to ensure operator safety and protection from heat. All electronic components shall be accessible from the front without removing sub-assemblies for service access.

B. Wiring

1. Wiring practices, materials and coding shall be in accordance with the requirements of the National Electrical Code, OSHA and applicable local codes and standards. All bolted connections of busbars, lugs and cables shall be in accordance with requirements of the National Electrical Code and other applicable standards. All electrical power connections shall be torqued to the required value and marked with a visual indicator.

2. Provisions shall be made in the cabinets to permit installation of input, output and external control cabling, using raceway or conduit. Provision shall be made for top and bottom access to input, output, bypass and DC connections. In conformance with NEC, connection cabinets shall provide for adequate wire bend radius. All copper busbars for customer power connections shall be tin plated for connection integrity.

C. Construction and Mounting

1. The UPS shall be in NEMA Type 1 enclosures, designed for floor mounting. The UPS shall be structurally adequate and have provisions for hoisting, jacking and forklift handling. Maximum cabinet height shall be 78.7 in. (2000mm).

D. Cooling

1. Cooling of the UPS shall be by forced air using a redundant fan configuration. Fan power shall be provided by the UPS.

2. The thermal design, along with all thermal and ambient sensors, shall be coordinated with the protective devices before excessive component or internal cabinet temperatures are exceeded. Air filters shall be located at the point of air inlet and be changeable.

2.2 COMPONENTS

Rectifier/Charger

A. General

1. The term rectifier/charger shall denote the solid-state equipment and controls necessary to convert AC to regulated DC for input to the inverter and for charging the battery.

B. AC Input Current Limiting

1. The rectifier/charger unit shall be provided with AC input current limiting whereby the maximum input current shall be limited to 140% of the full input current rating. Input current limit will be adjustable by service personnel to allow the UPS to be used with undersized feeder breakers.

C. DC Filter

1. The rectifier/charger shall have an output filter to minimize ripple current into the battery. The AC ripple voltage of the rectifier DC output shall not exceed 1% RMS of the float voltage. The filter shall be adequate to ensure that the DC output of the rectifier/charger will meet the input requirements of the inverter without the battery connected.

D. Automatic Rectifier Restart

1. Upon restoration of utility AC power, after a utility AC power outage and prior to a UPS automatic end-of-discharge shutdown, the rectifier/charger shall automatically restart and assume the inverter and battery recharge loads.

E. Battery Recharge

2. In addition to supplying power for the inverter load, the rectifier/charger shall be capable of producing battery charging current sufficient to replace 95% of the battery discharge power within ten (10) times the discharge time. After the battery is recharged, the rectifier/charger shall maintain the battery at full charge until the next emergency operation.

F. Overvoltage Protection

1. There shall be DC overvoltage protection so that if the DC voltage rises to the preset limit, the UPS will shut down automatically and initiate an uninterrupted load transfer to the static bypass line.

2.3 INVERTER

A. General

1. The term inverter shall denote the equipment and controls to convert DC from the rectifier/charger or battery to precise AC to power the load. The inverter shall be solid-state, capable of providing rated output power, and for increased performance the inverter shall be a pulse-width-modulated design and utilize insulated gate bipolar transistors (IGBTs).

B. Overload Capability

1. The inverter shall be capable of supplying current and voltage for overloads exceeding 100%. The inverter is to provide 150% of full load for 1 minute, 125% of full load for 10 minutes and 110% of full load for 1 hour. A status indicator and audible alarm shall indicate overload operation. The UPS shall transfer the load to bypass when overload capacity is exceeded.

C. Fault Clearing and Current Limit

1. The inverter shall be capable of supplying an overload current of 150% of its full-load rating for one minute. For greater currents or longer time duration, the inverter shall have electronic current-limiting protection to prevent damage to components. The critical load will be transferred to the static bypass automatically and uninterrupted. The inverter shall be self-protecting against any magnitude of connected output overload. Inverter control

logic shall sense and disconnect the inverter from the critical AC load without the requirement to clear protective fuses.

2.4 STEP LOAD RESPONSE

A. Voltage Distortion

1. Total harmonic distortion in the output voltage will not exceed 1% for 0% to 100% linear loads.
2. Total harmonic distortion in the output voltage will not exceed 4% for 0% to 100% non-linear loads.
3. Total harmonic distortion in the output voltage will not exceed 5% for 0% to 100% non-linear, unbalanced loads.

B. Phase Balance

1. Electronic controls shall be provided to regulate each phase so that an unbalanced loading will not cause the output voltage to go outside the specified voltage unbalance or phase displacement. With 100% load on one phase (and 0% load on the other two phases) or 100% load on two phases (and 0% load on the other phase), the voltage balance is to be within 2% and the phase displacement is to be 120 degrees within ±1.5 degrees.

C. Inverter Shutdown

1. For rapid removal of the inverter from the critical load, the inverter control electronics shall instantaneously turn off the inverter transistors. Simultaneously, the static transfer switch shall be turned on to maintain continuous power to the critical load.

D. Inverter DC Protection

1. The inverter shall be protected by the following disconnect levels:
   a. DC Overvoltage Shutdown
   b. DC Undervoltage Warning (Low Battery Reserve)—pre-warning time is adjustable
   c. DC Undervoltage Shutdown (End of Discharge)

E. Output Frequency

1. The output frequency of the inverter shall be controlled by a high-speed DSP capable of holding the inverter output frequency to within ±0.05% during steady state and transient conditions. Total deviation from the rated frequency, including short time fluctuations and drift, shall not exceed 0.05%.

2.5 Display and Controls

A. Monitoring and Control

1. The UPS shall be provided with a microprocessor-based unit status display and controls section designed for convenient and reliable user operation. A graphical liquid crystal display (LCD) shall be used to show a single-line diagram of the UPS and shall be provided as part of the monitoring and controls sections of the UPS. All operator controls and monitors shall be located on the front of the UPS cabinet. Monitoring functions such as metering, status and alarms shall be displayed on the graphical LCD. Additional features of the monitoring system shall include:
   a. Menu-driven display with pushbutton navigation
   b. Real-time clock (time and date)

c. Alarm history with time and date stamp
d. Memory with battery backup

B. Metering

1. The following parameters shall be displayed:
   a. Input AC voltage line-to-line
   b. Input AC current for each phase
   c. Input frequency
   d. Battery voltage
   e. Battery charge/discharge current
   f. Output AC voltage line-to-line
   g. Output AC current for each phase
   h. Output frequency
   i. Apparent power
   j. Active power
   k. Battery time left during battery operation

C. Selectable Input Contacts

1. The UPS shall have these available selectable input contacts:
   a. On Generator
   b. Fast Power Off
   c. MBB Auxiliary Contacts
   d. Start Battery Test
   e. Fault Acknowledge
   f. Bypass and Inverter Off
   g. Stop Battery Test

D. Alarm Messages

1. The following alarm messages shall be displayed:
   a. Mains Voltage Abnormal
   b. Mains Undervoltage
   c. Mains Freq. Abnormal
   d. Charger Fault
   e. Battery Reversed
   f. No Battery
   g. Control Power 1 Fail
   h. Parallel Comm. Fail
   i. Bypass Unable To Track
   j. Bypass Abnormal
   k. Inverter Asynchronous
   l. Fan Fault
   m. Control Power 2 Fail
   n. Unit Over Load
   o. System Over Load
   p. Bypass Phase Reversed

q. Transfer Time-Out
r. Load Sharing Fault
s. Parallel Connect Fault
t. Bypass Over Current
u. Output Ground Fault

E. Status Messages

1. The following UPS status messages shall be displayed:
   a. Rectifier (Off / Soft Start / Main Input On / Battery Input On)
   b. Input Supply (Normal Mode / Battery Mode / All Off)
   c. Battery Self Test (True / False)
   d. Input Disconnect (Open / Closed)
   e. EPO (True / False)
   f. Charger (On / Off)
   g. Output Disconnect (Open / Closed)
   h. Maint. Disconnect (Open / Closed)
   i. Bypass Disconnect (Open / Closed)
   j. Inverter (Off / Soft Start / On)
   k. Bypass (Normal / Unable To Trace / Abnormal)
   l. Output Supply (All Off / Bypass Mode / Inverter Mode / Output Disable)
   m. Inverter On (Enable / Disable)

F. Controls

1. UPS startup, shutdown and maintenance bypass operations shall be accomplished through pushbutton controls on the front panel. Menu-driven user prompts shall be provided to guide the operator through system operation without the use of additional manuals. Pushbuttons shall be provided to display the status of the UPS and to test and reset visual and audible alarms. A mimic screen shall be available on the LCD to depict a single-line diagram of the UPS with switch positions and power flow.

G. On-Line Battery Test

1. The UPS shall be provided with a menu-driven On-Line Battery Test feature. The test shall ensure the capability of the battery to supply power to the inverter while the load is supplied power in the normal mode.

2.6 STATIC TRANSFER SWITCH

A. General

1. A static transfer switch and bypass circuit shall be provided as an integral part of the UPS. The static switch shall be a naturally commutated high-speed static (SCR-type) device rated to conduct full load current continuously. The switch shall have an overload rating to clear a 20-ampere load branch circuit breaker.
2. The static transfer switch control logic shall contain an automatic transfer control circuit that senses the status of the inverter logic signals and operating and alarm conditions. This control circuit shall provide an uninterrupted transfer of the load to an alternate bypass source without exceeding the transient limits specified herein, when an overload or malfunction occurs within the UPS or to bypass the UPS for maintenance.

B. Uninterrupted Transfer

1. The transfer control logic shall automatically turn on the static transfer switch, transferring the critical AC load to the bypass source, after the transfer logic senses any of the following conditions:
   a. Inverter overload capacity exceeded
   b. Critical AC load overvoltage or undervoltage
   c. UPS fault condition
2. The transfer control logic shall inhibit an automatic transfer of the critical load to the bypass source if any of the following conditions are present:
   a. Bypass frequency out of limits
   b. Bypass out-of-synchronization range with inverter output

C. Uninterrupted Retransfer

1. Retransfer of the critical AC load from the bypass source to the inverter output shall be automatically initiated unless inhibited by manual control. The transfer control logic shall inhibit an automatic retransfer of the critical load to the inverter if one of the following conditions exists:
   a. Bypass out of synchronization range with inverter output
   b. Inverter/bypass voltage difference exceeding preset limits
   c. Overload condition exists in excess of inverter full load rating
   d. UPS fault condition present

2.7 MAINTENANCE BYPASS SWITCH

A. General

1. A manually operated maintenance bypass switch shall be incorporated into the UPS cabinet to directly connect the critical load to the bypass AC input power source, bypassing the rectifier/charger, inverter and static transfer switch.

B. Battery Cabinet

1. The battery cabinet shall include ten (10) year design life, valve-regulated, lead-acid battery cells housed in a separate cabinet that matches the UPS cabinet styling to form an integral system lineup. All battery cell inter-connects shall utilize bolted connections, and all batteries shall include copper, inserted terminal posts allowing connector torque of 110 in-lb (12.4 Nm). Battery cells shall be mounted on slide-out trays for ease of maintenance. A battery disconnect circuit breaker shall be included for isolation of the battery pack from the UPS module. Casters and leveling feet shall also be provided with the battery cabinet for ease of installation. When the application calls for the battery cabinet to be bolted to the UPS cabinet, an interconnecting cable kit will be available, precut and pre-lugged.

2.8 ACCESSORIES

A. Liebert IntelliSlot® Web Card (ISWEB-LB)

1. Provides communication outputs to indicate a change of status of the UPS. Outputs are provided for:
   a. SNMP
   b. HTML - Web page
   c. Allow use of Liebert Nform™ and or network management systems

B. Matching Maintenance Bypass and Distribution Cabinet

1. A make-before-break maintenance bypass with Solenoid Key Release Unit (SKRU) interlock shall be available in a cabinet that matches and may be bolted up to the UPS. Installation of the cabinet shall not affect the cooling ability of the UPS. Thermal-magnetic breakers shall be provided for bypass and maintenance isolation.

C. Remote Alarm Panel

1. The remote alarm panel shall have LED alarm lights. An audible alarm shall sound upon any alarm condition. The surface- or flush-mounted NEMA 1 enclosed panel shall indicate:
   a. Load on UPS LED
   b. Load on Bypass LED
   c. Battery Discharging LED
   d. Low Battery Warning LED
   e. UPS Alarm Condition LED
   f. New Alarm Condition LED (For a Second UPS Alarm Condition)
   g. Audible Alarm with Reset pushbutton
   h. Lamp Test/Reset pushbutton

PART 3 - EXECUTION

3.1 TRAINING

A. The Contractor shall provide a training session for up to five (5) owner's representatives for 2 normal workdays at a job site location determined by the owner.

B. The training session shall be conducted by a manufacturer's qualified representative. The training program shall consist of the instruction on the operation of the assembly, circuit breakers, and major components within the assembly.

3.2 FIELD QUALITY CONTROL

A. The following inspections and test procedures shall be performed by factory-trained field service personnel during the UPS startup.

1. Visual Inspection
   a. Inspect equipment for signs of damage.
   b. Verify installation per drawings.
   c. Inspect cabinets for foreign objects.
   d. Verify neutral and ground conductors are properly sized and configured.
   e. Inspect battery cases.
   f. Inspect battery for proper polarity.
   g. Verify all printed circuit boards are configured properly.

2. Mechanical Inspection
   a. Check all control wiring connections for tightness.
   b. Check all power wiring connections for tightness.
   c. Check all terminal screws, nuts and/or spade lugs for tightness.

3. Electrical Inspection
   a. Check all fuses for continuity.
   b. Confirm input voltage and phase rotation is correct.
   c. Assure connection and voltage of the battery string(s).

3.3 MANUFACTURER'S FIELD SERVICE

A. Service Personnel

1. The UPS manufacturer shall directly employ a nationwide service organization consisting of factory-trained field service personnel dedicated to the startup and maintenance of UPS and power equipment.
2. The manufacturer shall provide a national dispatch center to coordinate field service personnel schedules. One toll-free number shall reach a qualified support person 24 hours a day, 7 days a week, 365 days a year. If emergency service is required, on-site response time shall be four hours or less within 150 miles of an Emerson Network Power Liebert Services center.
3. Two local customer engineers shall be assigned to the site with a regional office as a backup. Escalation procedures shall be in place to notify Power Technical Support if a site is not functioning within 24 hours.

B. Replacement Parts Stocking

1. Parts shall be available through an extensive network to ensure round-the-clock parts availability throughout the country.
2. Spare parts shall be stocked by local field service personnel with backup available from national parts center and the manufacturing location. A national parts center Customer Support Parts Coordinator shall be on call 24 hours a day, 7 days a week, 365 days a year for immediate parts availability.

C. Maintenance Contracts

1. A complete offering of preventive and full-service maintenance contracts for both the UPS system and battery system shall be available.

D. Automated Site Monitoring

1. The UPS manufacturer shall provide as an option an automated site-monitoring service. This service shall be staffed by a qualified support person 24 hours a day, 7 days a week, 365 days a year. At the detection of an alarm within the UPS, the controls shall initiate communications with the monitoring service. The monitoring service shall be capable of interpreting the communicated alarms to allow dispatch of a service engineer.

END OF SECTION 26 33 54

SECTION 26 41 13 - LIGHTNING PROTECTION FOR STRUCTURES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes lightning protection for structures, structure elements.

B. It shall be sole responsibility of the contractor to provide complete design for lightning protection system and obtain all required permit.

C. Provide lighting protection for the entire building including existing building to remain.

D. Related sections

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 MRc2: CONSTRUCTION WASTE MANAGEMENT

A. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 018113 Sustainable Design Requirements.

B. EQc4.1: LOW-EMITTING MATERIALS – SEALANTS AND ADHESIVES

All sealants, adhesives, and sealant primers used on the interior of the building shall comply with the project requirements for Low-Emitting Materials – Sealants and Adhesives. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

C. EQc4.2: LOW-EMITTING MATERIALS – PAINTS AND COATINGS

All paints and coatings used in the building interior comply with the project requirements for Low-Emitting Materials – Paints and Coatings. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: For air terminals and mounting accessories.

1. Layout of the lightning protection system, along with details of the components to be used in the installation.
2. Include indications for use of raceway, data on how concealment requirements will be met, and calculations required by NFPA 780 for bonding of grounded and isolated metal bodies.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified Installer and manufacturer. Include data on listing or certification by UL.

B. It shall be sole responsibility of the contractor to provide complete design for lightning protection system duly sealed and signed by Professional Engineer and obtain all required permit.

C. Certification, signed by Contractor, that roof adhesive is approved by manufacturer of roofing material.

D. Field quality-control reports.

E. Comply with recommendations in NFPA 780, Annex D, "Inspection and Maintenance of Lightning Protection Systems," for maintenance of the lightning protection system.

F. Other Informational Submittals: Plans showing dimensioned as-built locations of grounding features, including the following:

1. Ground rods.
2. Ground loop conductor.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: Certified by UL and LPI as a Master Installer/Designer, trained and approved for installation of units required for this Project.

B. System Certificate:

1. UL Master Label.
2. LPI System Certificate.
3. UL Master Label Recertification.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 780, "Definitions" Article.

1.7 COORDINATION

A. Coordinate installation of lightning protection with installation of other building systems and components, including electrical wiring, supporting structures and building materials, metal bodies requiring bonding to lightning protection components, and building finishes.

B. Coordinate installation of air terminals attached to roof systems with roofing manufacturer and Installer.

C. Flashings of through-roof assemblies shall comply with roofing manufacturers' specifications.

1.8 WARRANTY

A. Warranty Period: Two years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 LIGHTNING PROTECTION SYSTEM COMPONENTS

A. Comply with UL 96 and NFPA 780.

B. Roof-Mounted Air Terminals: NFPA 780, Class II, aluminum unless otherwise indicated.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. East Coast Lightning Equipment Inc.
b. ERICO International Corporation.
c. Harger.
d. Heary Bros. Lightning Protection Co. Inc.
e. Independent Protection Co.
f. Preferred Lightning Protection.
g. Robbins Lightning, Inc.
h. Thompson Lightning Protection, Inc.

2. Air Terminals More than 24 Inches Long: With brace attached to the terminal at not less than half the height of the terminal.
3. Single-Membrane, Roof-Mounted Air Terminals: Designed specifically for single-membrane roof system materials. Comply with requirements in Division 07 roofing Sections.

C. Main and Bonding Conductors: Aluminum.

D. Ground Loop Conductor: The same size and type as the main conductor except tinned.

E. Ground Rods: Copper-clad 3/4 inch diameter and 10 feet long.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install lightning protection components and systems according to UL 96 A and NFPA 780.

B. Install conductors with direct paths from air terminals to ground connections. Avoid sharp bends.

C. Conceal the following conductors:

1. System conductors.
2. Down conductors.
3. Interior conductors.
4. Conductors within normal view of exterior locations at grade within 200 feet of building.

D. Cable Connections: Use exothermic-welded connections for all conductor splices and connections between conductors and other components.

1. Exception: In single-ply membrane roofing, exothermic-welded connections may be used only below the roof level.

E. Air Terminals on Single-Ply Membrane Roofing: Comply with roofing membrane and adhesive manufacturer's written instructions.

F. Bond lightning protection components with intermediate-level interconnection loop conductors to grounded metal bodies of building at 60-foot intervals.

3.2 SLEEVE AND SLEEVE-SEAL INSTALLATION FOR ELECTRICAL PENETRATIONS

A. Install sleeves and sleeve seals at penetrations of exterior floor and wall assemblies.

3.3 CORROSION PROTECTION

A. Do not combine materials that can form an electrolytic couple that will accelerate corrosion in the presence of moisture unless moisture is permanently excluded from junction of such materials.

B. Use conductors with protective coatings where conditions cause deterioration or corrosion of conductors.

3.4 FIELD QUALITY CONTROL

A. Notify Architect at least 48 hours in advance of inspection before concealing lightning protection components.

B. UL Inspection: Meet requirements to obtain a UL Master Label for system.

C. LPI System Inspection: Meet requirements to obtain an LPI System Certificate.

END OF SECTION 264113

SECTION 26 43 13 - SURGE PROTECTIVE DEVICES (SPDs) - LOW VOLTAGE AC SURGE PROTECTION FOR ELECTRICAL DISTRIBUTION SYSTEMS

PART 1 GENERAL

1.1 SCOPE

A. The Contractor shall furnish and install the Surge Protective Device (SPD) equipment having the electrical characteristics, ratings, and modifications as specified herein and as shown on the contract drawings. To maximize performance and reliability and to obtain the lowest possible let-through voltages, the ac surge protection shall be integrated into electrical distribution equipment such as switchgear, switchboards, panelboards, busway (integrated within bus plug), or motor control centers. Refer to related sections for surge requirements in:

1.2 RELATED SECTIONS

A. Section – Metal Enclosed Drawout Switchgear (Magnum DS) – Low Voltage

B. Section – Panelboards

C. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 REFERENCES

A. SPD units and all components shall be designed, manufactured, and tested in accordance with the latest applicable UL standard (ANSI/UL 1449 3rd Edition).

1.4 SUBMITTALS – FOR REVIEW/APPROVAL

A. The following information shall be submitted to the Engineer:

1. Provide verification that the SPD complies with the required ANSI/UL 1449 3rd Edition listing by Underwriters Laboratories (UL) or other Nationally Recognized Testing Laboratory (NRTL). Compliance may be in the form of a file number that can be verified on UL’s website or on any other NRTL’s website, as long as the website contains the following information at a minimum: model number, SPD Type, system voltage, phases, modes of protection, Voltage Protection Rating (VPR), and Nominal Discharge Current (I_n).
2. For sidemount mounting applications (SPD mounted external to electrical assembly), electrical/mechanical drawings showing unit dimensions, weights, installation instruction details, and wiring configuration.

B. Where applicable the following additional information shall be submitted to the engineer:
   1. Descriptive bulletins
   2. Product sheets

1.5 SUBMITTALS – FOR CONSTRUCTION

A. The following information shall be submitted for record purposes:
   1. Final as-built drawings and information for items listed in Section 1.04 and shall incorporate all changes made during the manufacturing process

1.6 QUALIFICATIONS

A. The manufacturer of the assembly shall be the manufacturer of the major components within the assembly.

B. For the equipment specified herein, the manufacturer shall be ISO 9001 or 9002 certified.

C. The manufacturer of this equipment shall have produced similar electrical equipment for a minimum period of five (5) years. When requested by the Engineer, an acceptable list of installations with similar equipment shall be provided demonstrating compliance with this requirement.

D. The SPD shall be compliant with the Restriction of Hazardous Substances (RoHS) Directive 2002/95/EC.

1.7 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of surge suppressors that fail in materials or workmanship within specified warranty period.

   1. Warranty Period: Five years from date of Substantial Completion.

1.8 DELIVERY, STORAGE AND HANDLING

A. Equipment shall be handled and stored in accordance with manufacturer’s instructions. One (1) copy of manufacturer’s instructions shall be included with the equipment at time of shipment.

1.9 OPERATION AND MAINTENANCE MANUALS

A. Operation and maintenance manuals shall be provided with each SPD shipped.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Eaton / Cutler-Hammer products

B. General Electric

C. Siemens

The listing of specific manufacturers above does not imply acceptance of their products that do not meet the specified ratings, features, and functions. Manufacturers listed above are not relieved from meeting these specifications in their entirety. Products in compliance with the specification and manufactured by others not named will be considered only if pre-approved by the Engineer ten (10) days prior to bid date.

2.2 VOLTAGE SURGE SUPPRESSION – GENERAL

A. Electrical Requirements

1. Unit Operating Voltage – Refer to drawings for operating voltage and unit configuration.
2. Maximum Continuous Operating Voltage (MCOV) – The MCOV shall not be less than 115% of the nominal system operating voltage.
3. The suppression system shall incorporate thermally protected metal-oxide varistors (MOVs) as the core surge suppression component for the service entrance and all other distribution levels. The system shall not utilize silicon avalanche diodes, selenium cells, air gaps, or other components that may crowbar the system voltage leading to system upset or create any environmental hazards.
4. Protection Modes – The SPD must protect all modes of the electrical system being utilized. The required protection modes are indicated by bullets in the following table:

	Protection Modes			
Configuration	L-N	L-G	L-L	N-G
Wye	●	●	●	●
Delta	N/A	●	●	N/A
Single Split Phase	●	●	●	●
High Leg Delta	●	●	●	●

5. Nominal Discharge Current (I_n) – All SPDs applied to the distribution system shall have a 20kA I_n rating regardless of their SPD Type (includes Types 1 and 2) or operating voltage. SPDs having an I_n less than 20kA shall be rejected.
6. ANSI/UL 1449 3rd Edition Voltage Protection Rating (VPR) – The maximum ANSI/UL 1449 3rd Edition VPR for the device shall not exceed the following:

Modes	208Y/120	480Y/277	600Y/347
L-N; L-G; N-G	700	1200	1500
L-L	1200	2000	3000

B. SPD Design

1. Maintenance Free Design – The SPD shall be maintenance free and shall not require any user intervention throughout its life. SPDs containing items such as replaceable modules, replaceable fuses, or replaceable batteries shall not be accepted. SPDs requiring any maintenance of any sort such as periodic tightening of connections shall not be accepted. SPDs requiring user intervention to test the unit via a diagnostic test kit or similar device shall not be accepted.
2. Balanced Suppression Platform – The surge current shall be equally distributed to all MOV components to ensure equal stressing and maximum performance. The surge suppression platform must provide equal impedance paths to each matched MOV. Designs incorporating replaceable SPD modules shall not be accepted.
3. Electrical Noise Filter – Each unit shall include a high-performance EMI/RFI noise rejection filter. Noise attenuation for electric line noise shall be up to 50 dB from 10 kHz to 100 MHz using the MIL-STD-220A insertion loss test method. Products unable able to meet this specification shall not be accepted.
4. Internal Connections – No plug-in component modules or printed circuit boards shall be used as surge current conductors. All internal components shall be soldered, hardwired with connections utilizing low impedance conductors.
5. Monitoring Diagnostics – Each SPD shall provide the following integral monitoring options:
   a. Protection Status Indicators - Each unit shall have a green / red solid-state indicator light that reports the status of the protection on each phase.
      i. For wye configured units, the indicator lights must report the status of all protection elements and circuitry in the L-N and L-G modes. Wye configured units shall also contain an additional green / red solid-state indicator light that reports the status of the protection elements and circuitry in the N-G mode. SPDs that indicate only the status of the L-N and L-G modes shall not be accepted.
      ii. For delta configured units, the indicator lights must report the status of all protection elements and circuitry in the L-G and L-L modes.
      iii. The absence of a green light and the presence of a red light shall indicate that damage has occurred on the respective phase or mode. All protection status indicators must indicate the actual status of the protection on each phase or mode. If power is removed from any one phase, the indicator lights must continue to indicate the status of the protection on all other phases and protection modes. Diagnostics packages that simply indicate whether power is present on a particular phase shall not be accepted.
   b. Remote Status Monitor – The SPD must include Form C dry contacts (one NO and one NC) for remote annunciation of its status. Both the NO and NC contacts shall change state under any fault condition.
   c. Audible Alarm and Silence Button – The SPD shall contain an audible alarm that will be activated under any fault condition. There shall also be an audible alarm silence button used to silence the audible alarm after it has been activated.
   d. Surge Counter – The SPD shall be equipped with an LCD display that indicates to the user how many surges have occurred at the location. The surge counter shall trigger each time a surge event with a peak current magnitude of a minimum of 50 ± 20A occurs. A reset pushbutton shall also be standard, allowing the surge counter to be zeroed. The reset button shall contain a mechanism to prevent accidental resetting of the counter via a single, short-duration button press. In order to

prevent accidental resetting, the surge counter reset button shall be depressed for a minimum of 2 seconds in order to clear the surge count total.

i. The ongoing surge count shall be stored in non-volatile memory. If power to the SPD is completely interrupted, the ongoing count indicated on the surge counter's display prior to the interruption shall be stored in non-volatile memory and displayed after power is restored. The surge counter's memory shall not require a backup battery in order to achieve this functionality.

6. Overcurrent Protection
   a. The unit shall contain thermally protected MOVs. These thermally protected MOVs shall have a thermal protection element packaged together with the MOV in order to achieve overcurrent protection of the MOV. The thermal protection element shall disconnect the MOV(s) from the system in a fail-safe manner should a condition occur that would cause them to enter a thermal runaway condition.
7. Fully Integrated Component Design – All of the SPD's components and diagnostics shall be contained within one discrete assembly. SPDs or individual SPD modules that must be ganged together in order to achieve higher surge current ratings or other functionality shall not be accepted.
8. Safety Requirements
   a. The SPD shall minimize potential arc flash hazards by containing no user serviceable / replaceable parts and shall be maintenance free. SPDs containing items such as replaceable modules, replaceable fuses, or replaceable batteries shall not be accepted. SPDs requiring any maintenance of any sort such as periodic tightening of connections shall not be accepted. SPDs requiring user intervention to test the unit via a diagnostic test kit or similar device shall not be accepted.
   b. SPDs designed to interface with the electrical assembly via conductors shall require no user contact with the inside of the unit. Such units shall have any required conductors be factory installed.
   c. Sidemount SPDs shall be factory sealed in order to prevent access to the inside of the unit. Sidemount SPDs shall have factory installed phase, neutral, ground and remote status contact conductors factory installed and shall have a pigtail of conductors protruding outside of the enclosure for field installation.

2.3 SYSTEM APPLICATION

A. The SPD applications covered under this section include distribution and branch panel locations, busway, motor control centers (MCC), switchgear, and switchboard assemblies. All SPDs shall be tested and demonstrate suitability for application within ANSI/IEEE C62.41 Category C, B, and A environments.

B. Surge Current Capacity – The minimum surge current capacity the device is capable of withstanding shall be as shown in the following table:

Minimum surge current capacity based on ANSI / IEEE C62.41 location category			
Category	Application	Per Phase	Per Mode
C	Service Entrance Locations (Switchboards, Switchgear, MCC, Main Entrance)	250 kA	125 kA
B	High Exposure Roof Top Locations (Distribution Panelboards)	160 kA	80 kA
A	Branch Locations (Panelboards, MCCs, Busway)	120 kA	60 kA

C. SPD Type – all SPDs installed on the line side of the service entrance disconnect shall be Type 1 SPDs. All SPDs installed on the load side of the service entrance disconnect shall be Type 1 or Type 2 SPDs.

2.4 LIGHTING AND DISTRIBUTION PANELBOARD REQUIREMENTS

A. The SPD application covered under this section includes lighting and distribution panelboards. The SPD units shall be tested and demonstrate suitability for application within ANSI/IEEE C62.41 Category B environments.

1. The SPD shall not limit the use of through-feed lugs, sub-feed lugs, and sub-feed breaker options.
2. SPDs shall be installed immediately following the load side of the main breaker. SPDs installed in main lug only panelboards shall be installed immediately following the incoming main lugs.
3. The panelboard shall be capable of re-energizing upon removal of the SPD.
4. The SPD shall be interfaced to the panelboard via a direct bus bar connection. Alternately, an SPD connected to a 30A circuit breaker for disconnecting purposes may be installed using short lengths of conductors as long as the conductors originate integrally to the SPD. The SPD shall be located directly adjacent to the 30A circuit breaker.
5. The SPD shall be included and mounted within the panelboard by the manufacturer of the panelboard.
6. The SPD shall be of the same manufacturer as the panelboard.
7. The complete panelboard including the SPD shall be UL67 listed.

B. Sidemount Mounting Applications Installation (SPD mounted external to electrical assembly)

1. Lead length between the breaker and suppressor shall be kept as short as possible to ensure optimum performance. Any excess conductor length shall be trimmed in order to minimize let-through voltage. The installer shall comply with the manufacturer's recommended installation and wiring practices.

C. Switchgear, Switchboard, MCC and Busway Requirements

1. The SPD application covered under this section is for switchgear, switchboard, MCC, and busway locations. Service entrance located SPDs shall be tested and demonstrate suitability for application within ANSI/IEEE C62.41 Category C environments.
2. The SPD shall be of the same manufacturer as the switchgear, switchboard, MCC, and busway

3. The SPD shall be factory installed inside the switchgear, switchboard, MCC, and/or bus plug at the assembly point by the original equipment manufacturer
4. Locate the SPD on the load side of the main disconnect device, as close as possible to the phase conductors and the ground/neutral bar.
5. The SPD shall be connected through a disconnect (30A circuit breaker). The disconnect shall be located in immediate proximity to the SPD. Connection shall be made via bus, conductors, or other connections originating in the SPD and shall be kept as short as possible.
6. The SPD shall be integral to switchgear, switchboard, MCC, and/or bus plug as a factory standardized design.
7. All monitoring and diagnostic features shall be visible from the front of the equipment.

2.5 ENCLOSURES

A. All enclosed equipment shall have NEMA 1 general purpose enclosures, unless otherwise noted. Provide enclosures suitable for locations as indicated on the drawings and as described below:
   1. NEMA 1 – Constructed of a polymer (units integrated within electrical assemblies) or steel (sidemount units only), intended for indoor use to provide a degree of protection to personal access to hazardous parts and provide a degree of protection against the ingress of solid foreign objects (falling dirt).
   2. NEMA 4 – Constructed of steel intended for either indoor or outdoor use to provide a degree of protection against access to hazardous parts; to provide a degree of protection of the equipment inside the enclosure against ingress of solid foreign objects (dirt and windblown dust); to provide a degree of protection with respect to the harmful effects on the equipment due to the ingress of water (rain, sleet, snow, splashing water, and hose directed water); and that will be undamaged by the external formation of ice on the enclosure. (sidemount units only)
   3. NEMA 4X – Constructed of stainless steel providing the same level of protection as the NEMA 4 enclosure with the addition of corrosion protection. (sidemount units only)

PART 3 EXECUTION

3.1 EXAMINATION

3.2 FACTORY TESTING

A. Standard factory tests shall be performed on the equipment under this section. All tests shall be in accordance with the latest version of NEMA and UL standards.

3.3 INSTALLATION

A. The Contractor shall install all equipment per the manufacturer's recommendations and the contract drawings.

3.4 WARRANTY

A. The manufacturer shall provide a full five (5) year warranty from the date of shipment against any SPD part failure when installed in compliance with manufacturer's written instructions and any applicable national or local code.

END OF SECTION 26 43 13

SECTION 26 51 00 - INTERIOR LIGHTING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Interior lighting fixtures, lamps, and ballasts.

2. Interior solid-state luminaires that use LED technology
3. Emergency lighting units.
4. Exit signs.
5. Lighting fixture supports.

B. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 DEFINITIONS

A. CCT: Correlated color temperature.

B. CRI: Color Rendering Index.

C. Fixture: See "Luminaire."

D. IP: International Protection or Ingress Protection Rating.

E. LED: Light-emitting diode.

F. Lumen: Measured output of lamp and luminaire, or both.

G. Luminaire: Complete lighting unit, including lamp, reflector, and housingF: Ballast factor.

1.4 MRc2: CONSTRUCTION WASTE MANAGEMENT

A. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 018113 Sustainable Design Requirements.

B. EQc4.1: LOW-EMITTING MATERIALS – SEALANTS AND ADHESIVES

All sealants, adhesives, and sealant primers used on the interior of the building shall comply with the project requirements for Low-Emitting Materials – Sealants and Adhesives. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

C. EQc4.2: LOW-EMITTING MATERIALS – PAINTS AND COATINGS

All paints and coatings used in the building interior comply with the project requirements for Low-Emitting Materials – Paints and Coatings. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

1.5 SUBMITTALS

A. Product Data: For each type of lighting fixture, arranged in order of fixture designation. Include data on features, accessories, finishes, and the following:

1. Physical description of lighting fixture including dimensions.
2. Emergency lighting units including battery and charger.
3. Energy-efficiency data.
4. Life, output (lumens, CCT, and CRI), and energy-efficiency data.
5. Photometric data and adjustment factors based on laboratory tests, complying with IESNA Lighting Measurements Testing & Calculation Guides, of each lighting fixture type. .

B. Installation instructions.

C. Field quality-control reports.

D. Operation and Maintenance Data: For lighting equipment and fixtures to include in emergency, operation, and maintenance manuals.

1. Provide a list of all lamp types used on Project; use ANSI and manufacturers' codes.

E. Warranty: Sample of special warranty.

1.6 QUALITY ASSURANCE

A. Luminaire Photometric Data Testing Laboratory Qualifications: Provided by manufacturers' laboratories that are accredited under the National Volunteer Laboratory Accreditation Program for Energy Efficient Lighting Products.

B. Comply with NFPA 70.

1.7 COORDINATION

A. Coordinate layout and installation of lighting fixtures and suspension system with other construction that penetrates ceilings or is supported by them, including HVAC equipment, fire-suppression system, and partition assemblies.

1.8 WARRANTY

A. Warranty Period for Ballast and lamps, batteries: Five years from date of Substantial Completion.

1.9 EXTRA MATERIALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Lamps: 10 for every 100 of each type and rating installed. Furnish at least one of each type.
2. Plastic Diffusers and Lenses**:** One for every 100 of each type and rating installed. Furnish at least one of each type.
.

1.10 COMMISSIONING

A. The materials, components and systems described in this section are subject to the Commissioning process. Contractor must comply with all Commissioning Requirements. Commissioning Requirements are described in Section 019113 General Commissioning Requirements and in Division 36 Commissioning. Division 36 provides an individual Commissioning specification section for each Division 2 through Division 33 specification section requiring Commissioning.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Products: Subject to compliance with requirements, provide available products that may be incorporated into the Work include, but are not limited to, products indicated on Drawings.

1. Lithonia Lighting

2. Day-Brite Lighting

3. Cooper Lighting

4. Mobern

5. GE

6. Failsafe

2.2 GENERAL REQUIREMENTS FOR LIGHTING FIXTURES AND COMPONENTS

A. Recessed Fixtures: Comply with NEMA LE 4 for ceiling compatibility for recessed fixtures.

B. Metal Parts: Free of burrs and sharp corners and edges.

C. Sheet Metal Components: Steel unless otherwise indicated. Form and support to prevent warping and sagging.

D. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position.

E. Diffusers and Globes:

1. Acrylic Lighting Diffusers: 100 percent virgin acrylic plastic. High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.

a. Lens Thickness: At least 0.125 minimum unless otherwise indicated.
b. UV stabilized.

2. Glass: Annealed crystal glass unless otherwise indicated.

F. Electromagnetic-Interference Filters: Factory installed to suppress conducted electromagnetic interference as required by MIL-STD-461E. Fabricate lighting fixtures with one filter on each ballast indicated to require a filter.

G. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

H. Bulb shape complying with ANSI C79.1.

I. Lamp base complying with **ANSI C81.61**.

J. Rated lamp life of **35,000**hours.

K. Lamps dimmable from 100 percent to 0 percent of maximum light output.

L. Internal driver.

2.3 EXIT SIGNS

A. General Requirements for Exit Signs: Comply with UL 924; for sign colors, visibility, luminance, and lettering size, comply with authorities having jurisdiction.

B. Internally Lighted Signs:

1. Lamps for AC Operation: Fluorescent, two for each fixture, 20,000 hours of rated lamp life.
2. Lamps for AC Operation: LEDs, 50,000 hours minimum rated lamp life.
3. Self-Powered Exit Signs (Battery Type): Integral automatic charger in a self-contained power pack.

a. Battery: Sealed, maintenance-free, nickel-cadmium type.
b. Charger: Fully automatic, solid-state type with sealed transfer relay.
c. Operation: Relay automatically energizes lamp from battery when circuit voltage drops to 80 percent of nominal voltage or below. When normal voltage is restored, relay disconnects lamps from battery, and battery is automatically recharged and floated on charger.
d. Test Push Button: Push-to-test type, in unit housing, simulates loss of normal power and demonstrates unit operability.
e. LED Indicator Light: Indicates normal power on. Normal glow indicates trickle charge; bright glow indicates charging at end of discharge cycle.

2.4 DOWNLIGHT

A. Minimum allowable efficacy of **80** lumens per watt.

B. Universal mounting bracket.

C. Integral junction box with conduit fittings.

2.5 RECESSED LINEAR

A. Minimum **1,500** lumens. Minimum allowable efficacy of **85** lumens per watt.

B. Integral junction box with conduit fittings.

2.6 HID LAMPS

2.7 LIGHTING FIXTURE SUPPORT COMPONENTS

A. Comply with Division 26 Section "Hangers and Supports for Electrical Systems" for channel- and angle-iron supports and nonmetallic channel and angle supports.

B. Single-Stem Hangers: 1/2-inch steel tubing with swivel ball fittings and ceiling canopy. Finish same as fixture.

C. Twin-Stem Hangers: Two, 1/2-inch steel tubes with single canopy designed to mount a single fixture. Finish same as fixture.

D. Wires: ASTM A 641/A 641M, Class 3, soft temper, zinc-coated steel, 12 gage

E. Wires for Humid Spaces: ASTM A 580/A 580M, Composition 302 or 304, annealed stainless steel, 12 gage.

F. Rod Hangers: 3/16-inch minimum diameter, cadmium-plated, threaded steel rod.

G. Hook Hangers: Integrated assembly matched to fixture and line voltage and equipped with threaded attachment, cord, and locking-type plug.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Lighting fixtures:

1. Set level, plumb, and square with ceilings and walls unless otherwise indicated.
2. Install lamps in each luminaire.

B. Lay-in Ceiling Lighting Fixtures Supports: Use grid as a support element.

1. Install ceiling support system wires**,** independent of the ceiling suspension devices**,** for each fixture. Locate not more than 6 inches from lighting fixture corners.
2. Support Clips: Fasten to lighting fixtures and to ceiling grid members at or near each fixture corner with clips that are UL listed for the application.
3. Install at least one independent support rod or wire from structure to a tab on lighting fixture. Wire or rod shall have breaking strength of the weight of fixture at a safety factor of 3.

C. Suspended Lighting Fixture Support:

1. Pendants and Rods: Where longer than 48 inches (1200 mm), brace to limit swinging.
2. Stem-Mounted, Single-Unit Fixtures: Suspend with twin-stem hangers.
3. Continuous Rows: Use tubing or stem for wiring at one point and tubing or rod for suspension for each unit length of fixture chassis, including one at each end.
4. Do not use grid as support for pendant luminaires. Connect support wires or rods to building structure.

D. Connect wiring according to Division 26 Section "Low-Voltage Electrical Power Conductors and Cables."

3.2 IDENTIFICATION

A. Install labels with panel and circuit numbers on concealed junction and outlet boxes. Comply with requirements for identification specified in Division 26 Section "Identification for Electrical Systems."

3.3 FIELD QUALITY CONTROL

A. Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation. Verify transfer from normal power to battery and retransfer to normal.

B. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.

END OF SECTION 265100

SECTION 26 56 00 - EXTERIOR LIGHTING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Exterior solid-state luminaires that are designed for and exclusively use LED lamp technology.
2. Luminaire supports.
3. Luminaire-mounted photoelectric relays.

B. Related Sections:

1. Division 26 Section "Interior Lighting" for exterior luminaires normally mounted on exterior surfaces of buildings.

C. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 DEFINITIONS

A. CCT: Correlated color temperature.

B. CRI: Color-rendering index.

C. LER: Luminaire efficacy rating.

D. Luminaire: Complete lighting fixture including lamp, reflector, and housing .

E. Standard: Same definition as "Pole" above.

1.4 MRc2: Construction Waste Management

A. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 018113 Sustainable Design Requirements.

1.5 SUBMITTALS

A. Product Data: For each luminaire, pole, and support component, arranged in order of lighting unit designation. Include data on features, accessories, finishes, and the following:

1. Physical description of luminaire, including materials, dimensions, effective projected area, and verification of indicated parameters.
2. Details of attaching luminaires and accessories.
3. Details of installation and construction.
4. Luminaire materials.
5. Photometric data based on laboratory tests of each luminaire type, complete with indicated lamps, ballasts, and accessories.
6. Photoelectric relays.
7. Lamps, including life, output, CCT, CRI, lumens, and energy-efficiency data.
8. Materials, dimensions, and finishes of poles.
9. Means of attaching luminaires to supports, and indication that attachment is suitable for components involved.

B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.

1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
2. Design calculations, certified by a qualified professional engineer, indicating strength of screw foundations and soil conditions on which they are based.
3. Wiring Diagrams: For power, signal, and control wiring.

C. Qualification Data: For qualified agencies providing photometric data for lighting fixtures.

D. Field quality-control reports.

E. Operation and Maintenance Data: For luminaires

1.6 QUALITY ASSURANCE

A. Luminaire Photometric Data Testing Laboratory Qualifications: Provided by an independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

C. Comply with IEEE C2, "National Electrical Safety Code."

D. Comply with NFPA 70.

1.7 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace products that fail in materials or workmanship; that corrode; or that fade, stain, perforate, erode, or chalk due to effects of weather or solar radiation within specified warranty period. Manufacturer may exclude lightning damage, hail damage, vandalism, abuse, or unauthorized repairs or alterations from special warranty coverage.

1. Warranty Period for Luminaires: Five years from date of Substantial Completion.
2. Warranty Period for Metal Corrosion: Five years from date of Substantial Completion.
3. Warranty Period for Color Retention: Five years from date of Substantial Completion.

1.8 COMMISSIONING

A. The materials, components and systems described in this section are subject to the Commissioning process. Contractor must comply with all Commissioning Requirements. Commissioning Requirements are described in Section 019113 General Commissioning Requirements and in Division 36 Commissioning. Division 36 provides an individual Commissioning specification section for each Division 2 through Division 33 specification section requiring Commissioning.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Products: Subject to compliance with requirements, provide product indicated on Drawings.

2.2 GENERAL REQUIREMENTS FOR LUMINAIRES

2.3 LUMINAIRE-MOUNTED PHOTOELECTRIC RELAYS

A. Comply with UL 773 or UL 773A.

2.4 LUMINAIRE REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. NRTL Compliance: Luminaires shall be listed and labeled for indicated class and division of hazard by an NRTL.

C. FM Global Compliance: Luminaires for hazardous locations shall be listed and labeled for indicated class and division of hazard by FM Global.

D. UL Compliance: Comply with UL 1598 **and listed for wet location**.

E. Lamp base complying with **ANSI C81.61**.

F. Bulb shape complying with ANSI C79.1.

G. CRI of **minimum 65**.

H. L70 lamp life of **35,000** hours.

I. Lamps dimmable from 100 percent to 0 percent of maximum light output.

J. Internal driver.

K. Nominal Operating Voltage: **120 V ac, 277 V ac**.

L. Lamp Rating: Lamp marked for outdoor use**.**

M. Source Limitations: Obtain luminaires from single source from a single manufacturer.

N. Source Limitations: For luminaires, obtain each color, grade, finish, type, and variety of luminaire from single source with resources to provide products of consistent quality in appearance and physical properties.

2.5 LUMINAIRE TYPES

A. Area and Site:
1. Luminaire Shape: Square
2. Mounting: Pole, Building.
3. Distribution: Type III.

2.6 TIME CLOCK

A. Electronic Time Switches: Solid state, programmable, with alphanumeric display; complying with UL 917.

1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2. Contact Configuration: SPST
3. Contact Rating: 30-A inductive or resistive, 480-V
4. Programs: Two on-off set points on a 24-hour schedule and an annual holiday schedule that overrides the weekly operation on holidays.
5. Circuitry: Allow connection of a photoelectric relay as substitute for on-off function of a program.
6. Astronomic Time: All channels.
7. Automatic daylight savings time changeover.
8. Battery Backup: Not less than seven days reserve, to maintain schedules and time clock.

2.7 Photo cell

A. Photo control shall have relay type switching action and have rating of 480V, 20A. The control shall be failsafe, wherein the lighting load remain on in event of controlcircuit failure.

PART 3 - EXECUTION

3.1 LUMINAIRE INSTALLATION

A. Install lamps in each luminaire.

B. Fasten luminaire to indicated structural supports.

1. Use fastening methods and materials selected to resist seismic forces defined for the application and approved by manufacturer.

C. Adjust luminaires that require field adjustment or aiming.

3.2 CORROSION PREVENTION

A. Aluminum: Do not use in contact with earth or concrete. When in direct contact with a dissimilar metal, protect aluminum by insulating fittings or treatment.

3.3 FIELD QUALITY CONTROL

A. Inspect each installed fixture for damage. Replace damaged fixtures and components.

B. Illumination Observations: Verify normal operation of lighting units after installing luminaires and energizing circuits with normal power source.

1. Verify operation of photoelectric controls.

END OF SECTION 265600

SECTION 27 15 00 - COMMUNICATIONS HORIZONTAL CABLING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Coaxial cable.
2. Cable connecting hardware, patch panels, and cross-connects.
3. Cabling system identification products.
4. Cable management system.

B. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 DEFINITIONS

A. BICSI: Building Industry Consulting Service International.

B. EMI: Electromagnetic interference.

C. IDC: Insulation displacement connector.

D. Outlet/Connectors: A connecting device in the work area on which horizontal cable or outlet cable terminates.

1.4 ADMINISTRATIVE REQUIREMENTS

A. Coordinate layout and installation of telecommunications cabling with Owner's telecommunications and LAN equipment and service suppliers.

B. Coordinate telecommunications outlet/connector locations with location of power receptacles at each work area.

1.5 MRc2: Construction Waste Management

A. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 018113 Sustainable Design Requirements.

B. EQc4.1: LOW-EMITTING MATERIALS – SEALANTS AND ADHESIVES

All sealants, adhesives, and sealant primers used on the interior of the building shall comply with the project requirements for Low-Emitting Materials – Sealants and Adhesives. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

1.6 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. For coaxial cable, include the following installation data for each type used:

a. Nominal OD.
b. Minimum bending radius.
c. Maximum pulling tension.

B. Shop Drawings:

1. System Labeling Schedules: Electronic copy of labeling schedules, in software and format selected by Owner.
2. Cabling administration drawings and printouts.
3. Wiring diagrams to show typical wiring schematics, including the following:

a. Cross-connects.

C. Samples: For workstation outlets, jacks, jack assemblies, in specified finish, one for each size and outlet configuration and faceplates for color selection and evaluation of technical features.

1.7 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer**,** qualified layout technician, installation supervisor, and field inspector.

B. Source quality-control reports.

C. Field quality-control reports.

1.8 CLOSEOUT SUBMITTALS

A. Maintenance Data: For splices and connectors to include in maintenance manuals.

B. Software and Firmware Operational Documentation:

1. Software operating and upgrade manuals.
2. Program Software Backup: On magnetic media or compact disk, complete with data files.
3. Device address list.
4. Printout of software application and graphic screens.

1.9 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Connecting Blocks: One of each type.
2. Device Plates: One of each type.

1.10 QUALITY ASSURANCE

A. Installer Qualifications: Cabling Installer must have personnel certified by BICSI on staff.

1. Layout Responsibility: Preparation of Shop Drawings and Cabling Administration Drawings, Cabling Administration Drawings, and field testing program development by an RCDD.
2. Testing Supervisor: Currently certified by BICSI as an RCDD to supervise on-site testing.

1.11 COMMISSIONING

A. The materials, components and systems described in this section are subject to the Commissioning process. Contractor must comply with all Commissioning Requirements. Commissioning Requirements are described in Section 019113 General Commissioning Requirements and in Division 36 Commissioning. Division 36 provides an individual Commissioning specification section for each Division 2 through Division 33 specification section requiring Commissioning.

PART 2 - PRODUCTS

2.1 HORIZONTAL CABLING DESCRIPTION

A. Horizontal cable and its connecting hardware provide the means of transporting signals between the telecommunications outlet/connector and the horizontal cross-connect located in the communications equipment room. This cabling and its connecting hardware are called a "permanent link," a term that is used in the testing protocols.

1. TIA/EIA-568-B.1 requires that a minimum of two telecommunications outlet/connectors be installed for each work area.
2. Horizontal cabling shall contain no more than one transition point or consolidation point between the horizontal cross-connect and the telecommunications outlet/connector.
3. Bridged taps and splices shall not be installed in the horizontal cabling.

B. A work area is approximately 100 sq. ft., and includes the components that extend from the telecommunications outlet/connectors to the station equipment.

C. The maximum allowable horizontal cable length is 295 feet This maximum allowable length does not include an allowance for the length of 16 feet to the workstation equipment or in the horizontal cross-connect.

2.2 PERFORMANCE REQUIREMENTS

A. General Performance: Horizontal cabling system shall comply with transmission standards in TIA/EIA-568-B.1 when tested according to test procedures of this standard.

B. Surface-Burning Characteristics: Comply with ASTM E 84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Flame-Spread Index: 25 or less.
2. Smoke-Developed Index: 450 or less.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

D. Grounding: Comply with J-STD-607-A.

E. Splitters shall be 2, 4, or 8-way, utilized as required in the distribution system. Splitters shall be Blonder Tongue SXRS or SCVS series shall be capable of 5 to 1000MHz frequency range.

F. One, two and four-way directional tap-offs shall be provided as required for the distribution system. These taps shall be suitable for use from 5 to 1000MHz minimum, rated for CATV' MATV distribution. Taps shall be Blonder Tongue SRT Series, or approved equal.

G. Single Outlet Taps shall be provided as shown on the drawings for connection to standard TV receivers. Mounting height shall be 18" unless otherwise noted on the drawings. Outlets shall be designed for 75 ohm systems, with a "G/F" push-on/screw-on connector on the outside and an "F" connector on the tap side. Connectors shall be mounted on stainless steel plates such as PICO MACOM #WPSS (1- port plate with female to female F-type coupler) or approved equal.

H. Connectors shall be provided as required. Connectors shall be coaxial solder less type, 75 ohm impedance and be designed for the specific type of cable used. All connectors shall be one-piece Compression style type "F" for RG-6U Quad shield cable and RG-I1Quad shield cabling. Connectors shall be ICM FS6U (for RG-6) and FS11V (for RG-II), or approved equal.
   1. When plenum cable is installed, appropriate connector for that specific cable must be used. Consult with the cable supplier for the correct connector.
   2. West Penn cable may require AIM connectors, due to smaller dielectric diameter.
   3. The appropriate connector must be used for the specific cable installed. ALL connectors shall be installed in a manner consistent with standard and proper installation procedures of cable television distribution systems.

I. System Main Trunk Cable to be used for all purposes other than drop cables, shall be RG-ll/U type w/l00% foil shield + 90% foil braid minimum. RG-ll cable shall be Commscope #2287.

J. Coaxial Drop Cables for us in making connections to room outlets shall be RG-6/U type w/100% foil shield + 90% braid minimum. RG-6 cable shall be Commscope #2227V

K. All coaxial cable must be prepared for connections using Cable-Prep Drop Cable Stripping Tools. Tool designation: CPT-110 (Blue) shall be used for RG-11/U cables and Tool CPT-6590 (Yellow) shall be used for RG-6/U cables.

L. Broadband indoor distribution amplifiers shall be Blonder Tongue QDAX-870-43-2W with RA-16 return amp Series, or approved equal.

M. All system taps and their associated input, output, and tap-off cables must be secured to the building structure in a manner to prohibit accidental disconnect from the tap. **No splices are permitted in the trunk lines or tap-off cables**. Provide taps with loss values established in the video distribution system design submittal. Install taps at Main Head-end on plywood backboard.

N. All cables shall be labeled on both ends with length and room destinations

O. All terminators shall be Blonder-Tongue Stock #4670BTF-TP or Gilbert GTR-59A, and be installed on all unused ports.

2.3 BACKBOARDS

A. Backboards: Plywood, fire-retardant treated, 3/4 by 48 by 96 inches . Comply with requirements in Division 06 Section "Rough Carpentry" for plywood backing panels.

2.4 COAXIAL CABLE

A. Manufacturers: Subject to compliance with requirements, provide products by the following:

1. Alpha Wire Company.
2. Belden Inc.
3. Coleman Cable, Inc.
4. CommScope, Inc.
5. Draka Cableteq USA.

B. NFPA and UL compliance, listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with UL 1655 and with NFPA 70 "Radio and Television Equipment" and "Community Antenna Television and Radio Distribution" Articles. Types are as follows:

1. CATV Cable: Type CATV.
2. CATV Plenum Rated: Type CATVP, complying with NFPA 262.
3. CATV Riser Rated: Type CATVR], complying with UL 1666.
4. CATV Limited Rating: Type CATVX.

2.5 COAXIAL CABLE HARDWARE

A. Manufacturers: Subject to compliance with requirements, provide products by the following:

1. Emerson Network Power Connectivity Solutions.
2. Leviton Commercial Networks Division.
3. Siemon Co. (The).

B. Coaxial-Cable Connectors: Type BNC, 75 ohms.

2.6 GROUNDING

A. Comply with requirements in Division 26 Section "Grounding and Bonding for Electrical Systems" for grounding conductors and connectors.

B. Comply with J-STD-607-A.

2.7 IDENTIFICATION PRODUCTS

A. Comply with TIA/EIA-606-A and UL 969 for labeling materials, including label stocks, laminating adhesives, and inks used by label printers.

B. Comply with requirements in Division 26 Section "Identification for Electrical Systems."

2.8 CABLE MANAGEMENT SYSTEM

A. Manufacturers: Subject to compliance with requirements available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following]:

1. iTRACS Corporation, Inc.
2. TelSoft Solutions.
3.

B. Description: Computer-based cable management system, with integrated database and graphic capabilities.

C. Document physical characteristics by recording the network, TIA/EIA details, and connections between equipment and cable.

D. Information shall be presented in database view**,** schematic plans, or technical drawings.

1. AutoCAD drawing software shall be used as drawing and schematic plans software.

E. System shall interface with the following testing and recording devices:

1. Direct upload tests from circuit testing instrument into the personal computer.
2. Direct download circuit labeling into labeling printer.

2.9 SOURCE QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to evaluate cables.

B. Factory test UTP and optical fiber cables on reels according to TIA/EIA-568-B.1.

C. Factory test UTP cables according to TIA/EIA-568-B.2.

D. Factory test multimode optical fiber cables according to TIA-526-14-A and TIA/EIA-568-B.3.

E. Factory-sweep test coaxial cables at frequencies from 5 MHz to 1 GHz. Sweep test shall test the frequency response, or attenuation over frequency, of a cable by generating a voltage whose frequency is varied through the specified frequency range and graphing the results.

F. Cable will be considered defective if it does not pass tests and inspections.

G. Prepare test and inspection reports.

PART 3 - EXECUTION

3.1 ENTRANCE FACILITIES

A. Coordinate backbone cabling with the protectors and demarcation point provided by communications service provider.

3.2 WIRING METHODS

A. Install cables in pathways and cable trays except within consoles, cabinets, desks, and counters[and except in accessible ceiling spaces and in gypsum board partitions where unenclosed wiring method may be used. Conceal pathways and cables except in unfinished spaces.

1. Install plenum cable in environmental air spaces, including accessible ceilings.

B. Wiring within Enclosures:

1. Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.
2. Install lacing bars and distribution spools.
3. Install conductors parallel with or at right angles to sides and back of enclosure.

3.3 INSTALLATION OF CABLES

A. Comply with NECA 1.

B. General Requirements for Cabling:

1. Comply with TIA/EIA-568-B.1.
2. Comply with BICSI ITSIM, Ch. 6, "Cable Termination Practices."

3. Terminate conductors; no cable shall contain unterminated elements. Make terminations only at indicated outlets, terminals, cross-connects, and patch panels.
4. Cables may not be spliced. Secure and support cables at intervals not exceeding 30 inches and not more than 6 inches from cabinets, boxes, fittings, outlets, racks, frames, and terminals.
5. Install lacing bars to restrain cables, to prevent straining connections, and to prevent bending cables to smaller radii than minimums recommended by manufacturer.
6. Bundle, lace, and train conductors to terminal points without exceeding manufacturer's limitations on bending radii, but not less than radii specified in BICSI ITSIM, "Cabling Termination Practices" Chapter. Install lacing bars and distribution spools.
7. Do not install bruised, kinked, scored, deformed, or abraded cable. Do not splice cable between termination, tap, or junction points. Remove and discard cable if damaged during installation and replace it with new cable.
8. Cold-Weather Installation: Bring cable to room temperature before dereeling. Heat lamps shall not be used for heating.
9. In the communications equipment room, install a 10-foot- long service loop on each end of cable.
10. Pulling Cable: Comply with BICSI ITSIM, Ch. 4, "Pulling Cable." Monitor cable pull tensions.

C. Open-Cable Installation:

1. Install cabling with horizontal and vertical cable guides in telecommunications spaces with terminating hardware and interconnection equipment.
2. Cable shall not be run through structural members or in contact with pipes, ducts, or other potentially damaging items.

D. Installation of Cable Routed Exposed under Raised Floors:

1. Install plenum-rated cable only.
2. Install cabling after the flooring system has been installed in raised floor areas.
3. Coil cable 6 feet long not less than 12 inches in diameter below each feed point.

E. Outdoor Coaxial Cable Installation:

1. Install outdoor connections in enclosures complying with NEMA 250, Type 4X. Install corrosion-resistant connectors with properly designed O-rings to keep out moisture.
2. Attach antenna lead-in cable to support structure at intervals not exceeding 36 inches.

F. Group connecting hardware for cables into separate logical fields.

G. Separation from EMI Sources:

1. Comply with BICSI TDMM and TIA-569-B for separating unshielded copper voice and data communication cable from potential EMI sources, including electrical power lines and equipment.
2. Separation between open communications cables or cables in nonmetallic raceways and unshielded power conductors and electrical equipment shall be as follows:

a. Electrical Equipment Rating Less Than 2 kVA: A minimum of 5 inches.
b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 12 inches..
c. Electrical Equipment Rating More Than 5 kVA: A minimum of 24 inches..

3. Separation between Communications Cables and Fluorescent Fixtures: A minimum of 5 inches.

3.4 FIRESTOPPING

A. Comply with requirements in Division 07 Section "Penetration Firestopping."

B. Comply with TIA-569-B, Annex A, "Firestopping."

C. Comply with BICSI TDMM, "Firestopping Systems" Article.

3.5 GROUNDING

A. Install grounding according to BICSI TDMM, "Grounding, Bonding, and Electrical Protection" Chapter.

B. Comply with J-STD-607-A.

C. Locate grounding bus bar to minimize the length of bonding conductors. Fasten to wall allowing at least 2-inch clearance behind the grounding bus bar. Connect grounding bus bar with a minimum No. 4 AWG grounding electrode conductor from grounding bus bar to suitable electrical building ground.

D. Bond metallic equipment to the grounding bus bar, using not smaller than No. 6 AWG equipment grounding conductor.

3.6 IDENTIFICATION

A. Identify system components, wiring, and cabling complying with TIA/EIA-606-A. Comply with requirements for identification specified in Division 26 Section "Identification for Electrical Systems."
1. Color-code cross-connect fields. Apply colors to voice and data service backboards, connections, covers, and labels.

B. Using cable management system software specified in Part 2, develop Cabling Administration Drawings for system identification, testing, and management. Use unique, alphanumeric designation for each cable and label cable, jacks, connectors, and terminals to which it connects with same designation. At completion, cable and asset management software shall reflect as-built conditions.

C. Comply with requirements in Division 09 Section "Interior Painting" for painting backboards. For fire-resistant plywood, do not paint over manufacturer's label.

D. Cable Schedule: Post in prominent location in each equipment room and wiring closet. List incoming and outgoing cables and their designations, origins, and destinations. Protect with rigid frame and clear plastic cover. Furnish an electronic copy of final comprehensive schedules for Project.

E. Cabling Administration Drawings: Show building floor plans with cabling administration-point labeling. Identify labeling convention and show labels for telecommunications closets, backbone pathways and cables, entrance pathways and cables, terminal hardware and positions, horizontal cables, work areas and workstation terminal positions, grounding buses and pathways, and equipment grounding conductors. Follow convention of TIA/EIA-606-A. Furnish electronic record of all drawings, in software and format selected by Owner.

F. Cable and Wire Identification:

1. Label each cable within 4 inches of each termination and tap, where it is accessible in a cabinet or junction or outlet box, and elsewhere as indicated.
2. Each wire connected to building-mounted devices is not required to be numbered at device if color of wire is consistent with associated wire connected and numbered within panel or cabinet.
3. Exposed Cables and Cables in Cable Trays and Wire Troughs: Label each cable at intervals not exceeding 50 feet .
4. Label each terminal strip and screw terminal in each cabinet, rack, or panel.

    a. Individually number wiring conductors connected to terminal strips, and identify each cable or wiring group being extended from a panel or cabinet to a building-mounted device shall be identified with name and number of particular device as shown.
    b. Label each unit and field within distribution racks and frames.

5. Identification within Connector Fields in Equipment Rooms and Wiring Closets: Label each connector and each discrete unit of cable-terminating and connecting hardware. Where similar jacks and plugs are used for both voice and data communication cabling, use a different color for jacks and plugs of each service.
6. Uniquely identify and label work area cables extending from the MUTOA to the work area. These cables may not exceed the length stated on the MUTOA label.

G. Labels shall be preprinted or computer-printed type with printing area and font color that contrasts with cable jacket color but still complies with requirements in TIA/EIA-606-A.

1. Cables use flexible vinyl or polyester that flex as cables are bent.

3.7 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:

1. Visually inspect UTP and optical fiber cable jacket materials for NRTL certification markings. Inspect cabling terminations in communications equipment rooms for compliance with color-coding for pin assignments, and inspect cabling connections for compliance with TIA/EIA-568-B.1.
2. Coaxial Cable Tests: Conduct tests according to Division 27 Section "Master Antenna Television System."

B. Document data for each measurement. Data for submittals shall be printed in a summary report that is formatted similar to Table 10.1 in BICSI TDMM, or transferred from the instrument to the computer, saved as text files, and printed and submitted.

C. End-to-end cabling will be considered defective if it does not pass tests and inspections.

D. Prepare test and inspection reports.

3.8 DEMONSTRATION

A. Train Owner's maintenance personnel in cable-plant management operations, including changing signal pathways for different workstations, rerouting signals in failed cables, and keeping records of cabling assignments and revisions when extending wiring to establish new workstation outlets**.**

B. Refer Division 01 for administrative and procedural requirements for demonstration and training.

END OF SECTION 271500

SECTION 27 41 33 - MASTER ANTENNA TELEVISION SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. MATV equipment using cable television service, direct broadcast satellite service, an off-air antenna system as the signal source.
2. Off-air antennas.
3. MATV head-end components.
4. Distribution components.

B. Related Sections:

1. Division 27 Section "Communications Horizontal Cabling" for coaxial, UTP, and fiber-optic cables and connectors.

C. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

1.3 DEFINITIONS

A. Agile Receiver: A broadband receiver that can be tuned to any desired channel.

B. A/V: Audio/Visual.

C. Broadband: For the purposes of this Section, wide bandwidth equipment or systems that can carry signals occupying in the frequency range of 54 to 1002 MHz. A broadband communication system can simultaneously accommodate television, voice, data, and many other services.

D. Carrier: A pure-frequency signal that is modulated to carry information. In the process of modulation, the signal is spread out over a wider band. The carrier frequency is the center frequency on any television channel.

E. CATV: Community antenna television. A communication system that simultaneously distributes several different channels of broadcast programs and other information to customers via a coaxial cable.

F. CCTV: Closed-circuit television.

G. CEA: Consumer Electronics Association.

H. dBmV: Decibels relative to 1 mV across 75 ohms. Zero dBmV is defined as 1 mV across 75 ohms. dBmV = 20 log $10(V_1/V_2)$ where V_1 is the measurement of voltage at a point having identical impedance to V_2 (0.001 V across 75 ohms).

I. Headend: The control center of the MATV system, where incoming signals are amplified, converted, processed, and combined into a common cable along with any locally originated television signals, for transmission to user-interface points. It is also called the "central retransmission facility."

J. I/O: Input/Output.

K. MATV: Master antenna television. A small television antenna distribution system usually restricted to one or two buildings.

L. RF: Radio frequency.

1.4 SYSTEM DESCRIPTION

A. System shall consist of cable television service, direct broadcast satellite service, an off-air antenna system and a coaxial cable distribution system.

1. Headend equipment shall consist of receiving antennas, satellites, and associated signal distribution amplification and equalization as shown on drawings.
2. Distribution of direct broadcast satellite-service signals, which includes coordinating with Owner's selected service provider for installation of its dish-type antennas and processing the signals as needed to provide specified services combined into a single-feed point ready for connection into the distribution system. Obtain signal levels and noise and distortion characteristics from service provider as the point of departure for system layout and final equipment selection.
3. Distribution of cable television service signals, which includes coordinating with Owner's selected service provider for installation of cable to the service point ready for connection into the distribution system. Obtain signal levels and noise and distortion characteristics from service provider as the point of departure for system layout and final equipment selection.
4. Cable distribution system consisting of coaxial cables, user interfaces, signal taps and splitters, RF amplifiers, signal equalizers, power supplies, and required hardware, complying with CEA-310-E and CEA-2032 and resulting in performance parameters specified in this Section. System shall be capable of distributing television channels according to CEA-542-B.

B. Hardware Requirements: Use plug-in, modular, solid-state electronic components. Mount amplifiers and other powered equipment in standard 19-inch (483-mm) cabinet complying with CEA-310-E.

C. Off-Air Stations: Install antennas for the reception and distribution of selected stations.

1.5 PERFORMANCE REQUIREMENTS

A. Minimum acceptable performance of distribution system at all user-interface points shall be as follows:

1. RF Video-Carrier Level: Between 3 and 12 dBmV.
2. Relative Video-Carrier Level: Within 3 dB to adjacent channel.
3. Carrier Level Stability, Short Term: Level shall not change more than 0.5 dB during a 60-minute period.
4. Carrier Level Stability, Long Term: Level shall not change more than 2 dB during a 24-hour period.
5. Channel Frequency Response: Across any 6-MHz channel in the 54- to 220-MHz frequency range, referenced to video; signal amplitude shall be plus or minus 1 dB, maximum.
6. Carrier-to-Noise Ratio: 45 dB or more.
7. RF Visual Signal-to-Noise Ratio: 43 dB or more.
8. Antenna Combiner Insertion Loss: 40 dB maximum.
9. Signal Power Splitter and Isolation Tap Return Loss: 17 dB maximum.
10. Cable Connectors Attenuation: Less than 0.1 dB.
11. Cross Modulation: Less than minus 50 dB.
12. Carrier-to-Echo Ratio: More than 40 dB.
13. Composite Triple Beat: Less than minus 53 dB.
14. Second Order Beat: Less than minus 60 dB.
15. Terminal Isolation from Television to Television: 25 dB, minimum.
16. Terminal Isolation between Television and FM: 35 dB, minimum.
17. Hum Modulation: 2 percent, maximum.
18. RF FM Carrier Level: 13 to 17 dB below video-carrier level.
19. FM Frequency Response: More than in the 88- to 108-MHz frequency range; signal amplitude is plus or minus 0.75 dB, maximum.
20. FM Carrier-to-Noise Ratio: More than 24 dB.

1.6 MRc2: Construction Waste Management

A. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 018113 Sustainable Design Requirements.

B. EQc4.1: LOW-EMITTING MATERIALS – SEALANTS AND ADHESIVES

All sealants, adhesives, and sealant primers used on the interior of the building shall comply with the project requirements for Low-Emitting Materials – Sealants and Adhesives. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

1.7 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: For headend and distribution system. Include plans, elevations, sections, details, and attachments to other work.

1. Show fabrication and installation details for television equipment.
2. Functional Block Diagram: Show single-line interconnections between components for headend and distribution system to user-interface points. Show cable types and sizes.
3. Dimensioned Plan and Elevations of Headend Equipment: Show access and workspace requirements.
4. Wiring Diagrams: For power, signal, and control wiring. For UTP or fiber-optic cable, include cross connects, patch panels, and patch cords.

C. Samples: Full size for each outlet device plate in required colors and textures.

D. Design Calculations: Calculate signal attenuation budget and show calculated line and equipment losses for the system based on the functional block diagram, to show that proposed system layout can be expected to perform up to specification. Calculate signal strength from sources to headend input points for each antenna, satellite dish, and CATV grouping. Allowable losses between components and user interface shall be used to determine size and type of coaxial cable.

E. Coordination Drawings: Include dimensioned plan and elevation views of components and enclosures. Show access and workspace requirements.

F. Equipment List: Include each piece of equipment and include model number, manufacturer, serial number, location, and date of original installation. Insert testing record of each piece of adjustable equipment, listing name of person testing, date of test, and description of as-left set points.

G. Field quality-control reports.

H. Operation and Maintenance Data: For headend and distribution system to include in emergency, operation, and maintenance manuals.

1.8 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

1.9 PROJECT CONDITIONS

A. Environmental Limitations: System components shall be equipped and rated for the environments in which they are installed.

B. Environmental Conditions: Capable of withstanding the following environmental conditions without mechanical or electrical damage or degradation of operating capability:

1. Interior, Controlled Environment: System components, except central-station control unit, installed in temperature-controlled interior environments shall be rated for continuous operation in ambient conditions of 36 to 122 deg F dry bulb and 20 to 90 percent relative humidity, noncondensing.

2. Exterior Environment: System components installed in locations exposed to weather shall be rated for continuous operation in ambient conditions of minus 30 to plus 122 deg F dry bulb and 20 to 90 percent relative humidity, condensing. Rate for continuous operation when exposed to rain as specified in NEMA 250, winds up to 85 mph and snow cover up to 24 inches thick.

1.10 COORDINATION

A. Coordinate size and location of raceway system and provisions for electrical power to equipment specified in this Section.

B. Coordinate Work of this Section with requirements of cable television service, direct broadcast satellite service, an off-air antenna system.

C. Coordinate sizes and locations of concrete bases with actual equipment provided.

D. Coordinate installation of roof curbs, equipment supports, and roof penetrations with actual equipment provided.

1.11 MAINTENANCE SERVICE

A. Initial Maintenance Service: Beginning at Substantial Completion, provide three years full maintenance by skilled employees of MATV system Installer. Include quarterly adjusting as required for optimum system performance. Provide parts and supplies the same as those used in the manufacture and installation of original equipment.

B. Continuing Maintenance Proposal: From Installer to Owner, in the form of a standard yearly (or other period) maintenance agreement, starting on date initial maintenance service is concluded. State services, obligations, conditions, and terms for agreement period and for future renewal options.

1.12 EXTRA MATERIALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents. Provide no fewer than one of each item listed below. Deliver extra materials to Owner.

1. Fuses: One for every 10 of each type and rating.
2. Splitters: One for every 10 installed.
3. MATV Distribution Power Amplifiers: One for every 10 of each type installed.
4. MATV Signal Traps: One for every 10 of each type used.
5. MATV Attenuators: One for every 10 of each type used.
6. Cable: 100 feet of each type used.

1.13 COMMISSIONING

A. The materials, components and systems described in this section are subject to the Commissioning process. Contractor must comply with all Commissioning Requirements. Commissioning Requirements are described in Section 019113 General Commissioning Requirements and in Division 36 Commissioning. Division 36 provides

an individual Commissioning specification section for each Division 2 through Division 33 specification section requiring Commissioning.

PART 2 - PRODUCTS

2.1 SYSTEMS REQUIREMENTS

A. Components: Plug-in, modular, heavy-duty, industrial- or commercial-grade units.

B. Equipment: Silicon-based, solid-state, integrated circuit devices.

C. Power Supply Characteristics: Devices shall be within specified parameters for ac supply voltages within the range of 105 to 130 V.

D. Protect signal cables and connected components against transient-voltage surges by suppressors and absorbers designed specifically for that purpose. Comply with requirements in Division 26 Section "Transient-Voltage Suppression for Low-Voltage Electrical Power Circuits."

E. Provide ac-powered equipment with integral surge suppressors complying with UL 1449.

F. RF and Video Impedance Matching: Signal-handling components, including connecting cable, shall have end-to-end impedance-matched signal paths. Match and balance devices used at connections where it is impossible to avoid impedance mismatch or mismatch of balanced circuits to unbalanced circuits.

2.2 MATV EQUIPMENT

A. Description: Signal-source components, signal-processing and amplifying equipment, distribution components, and interconnecting wiring. System shall receive, amplify, process, and distribute signals to outlets for receiving sets. Equipment shall translate UHF channels to VHF channels before distribution to outlets.

B. Identification of Signal Sources Distributed:

1. Insert signal sources and basic service selection.

C. MATV System Qualitative and Quantitative Performance Requirements: Reception quality of color-television program transmissions at each system outlet from each service and source shall be equal to or superior than that obtained with performance checks specified in "Field Quality Control" Article, using standard, commercial, cable-ready, multiple A/V input color-television receivers.

D. Provide as required the following VHF/ UHF antennas Blonder Tongue:

E. BTY-LP-BB Broadband VHF Antenna Covers chs-2-6 and 7-13.

F. BTY-UHF-BB Broadband UHF Antenna Covers chs-14-83.

G. Provide preamps and power supplies as required PS-1526-or PS-1536.

H. Provide (1) 16 Port Blonder Tongue OC-16 Passive Combiner.

I. Provide Blonder Tongue model # MIRC-12 Micro Modulator Rack Chassis (1)

J. Provide Blonder Tongue model # MIPS-12 Power supply (1) required per chassis.

K. Provide Blonder Tongue model # AMCM-860 Agile Micro Mod (1) per modulated channel

L. Provide Blonder Tongue model # DHDC-DV DIG & HDTV Down converter(1)per channel

M. Provide Blonder Tongue model # DHDC-UV DIG & HDTV Up converter(1)per channel

N. Provide (1) enclosed cabinet with front and rear door Blonder Tongue model # RMX-7019-24

O. Provide (2) 6 port Tripp-lite power strips RS-0615-R.

P. The Contractor shall provide whatever preamplifiers, power supplies, attenuators, and band pass filters or traps that are required to produce reception acceptable to the Owner's representative.

2.3 MATV/SATV/CATV RF DISTRIBUTION :

A. Splitters shall be 2, 4, or 8-way, utilized as required in the distribution system. Splitters shall be Blonder Tongue SXRS or SCVS series shall be capable of 5 to 1000MHz frequency range...

B. One, two and four-way directional tap-offs shall be provided as required for the distribution system. These taps shall be suitable for use from 5 to 1000MHz minimum, rated for CATV' MATV distribution. Taps shall be Blonder Tongue SRT Series, or approved equal.

C. Single Outlet Taps shall be provided as shown on the drawings for connection to standard TV receivers. Mounting height shall be 18" unless otherwise noted on the drawings. Outlets shall be designed for 75 ohm systems, with a "G/F" push-on/screw-on connector on the outside and an "F" connector on the tap side. Connectors shall be mounted on stainless steel plates such as PICO MACOM #WPSS (1- port plate with female to female F-type coupler) or approved equal.

D. Connectors shall be provided as required. Connectors shall be coaxial solder less type, 75 ohm impedance and be designed for the specific type of cable used. All connectors shall be one-piece Compression style type "F" for RG-6U Quad shield cable and RG-l1Quad shield cabling. Connectors shall be ICM FS6U (for RG-6) and FS11V (for RG-II), or approved equal.

E. When plenum cable is installed, appropriate connector for that specific cable must be used. Consult with the cable supplier for the correct connector.

F. West Penn cable may require AIM connectors, due to smaller dielectric diameter.

G. The appropriate connector must be used for the specific cable installed. ALL connectors shall be installed in a manner consistent with standard and proper installation procedures of cable television distribution systems.

H. System Main Trunk Cable to be used for all purposes other than drop cables, shall be RG-ll/U type w/l00% foil shield + 90% foil braid minimum. RG-ll cable shall be Commscope #2287.

I. Coaxial Drop Cables for us in making connections to room outlets shall be RG-6/U type w/100% foil shield + 90% braid minimum. RG-6 cable shall be Commscope #2227V

J. All coaxial cable must be prepared for connections using Cable-Prep Drop Cable Stripping Tools. Tool designation: CPT-110 (Blue) shall be used for RG-11/U cables and Tool CPT-6590 (Yellow) shall be used for RG-6/U cables.

K. Broadband indoor distribution amplifiers shall be Blonder Tongue QDAX-870-43-2W with RA-16 return amp Series, or approved equal.

L. All system taps and their associated input, output, and tap-off cables must be secured to the building structure in a manner to prohibit accidental disconnect from the tap. No splices are permitted in the trunk lines or tap-off cables. Provide taps with loss values established in the video distribution system design submittal. Install taps at Main Head-end on plywood backboard.

M. All cables shall be labeled on both ends with length and room destinations

N. All terminators shall be Blonder-Tongue Stock #4670BTF-TP or Gilbert GTR-59A, and be installed on all unused ports.

2.4 VIDEO SYSTEM PERFORMANCE

A. Upon completion of the video system installation, it shall be the responsibility of the Contractor to perform the necessary adjustments to achieve the system design parameters. All equalizers shall be adjusted so that all signals across the band are' equal, plus or minus 3 DB, at the input to each amplifier. Amplifier gains shall be adjusted to designated output levels.

B. Should the demonstration of performance show that the Contractor has not properly balanced the system and that picture degradation is present or that the output is not as specified, the Contractor shall immediately make all necessary changes or adjustments, at no charge to the owner, and a second performance demonstration conducted.

C. The Contractor shall test and submit test reports for the following:

D. Test all coaxial cables for open, short and ground.

E. Test all coaxial cable for end to end signal performance.

F. Test picture quality at each video outlet.

G. Test all coaxial cable for frequency response and insertion loss at 5-800 MHZ.

H. Test all coaxial cable to show conformance with manufacturer’s Specifications, the National Cable Television Standards, and FCC Standards.

I. Provide test as required to show compliance with performance Specifications below, test equipment utilized, and reports shall be generated by test equipment as manufactured by Wavetek Stealth.

J. The Contractor shall provide a video distribution system in compliance with the following performance specifications:

K. Each video outlet shall receive a MATV/ CATV broadcast for a bandwidth through 860 MHZ.

L. The equipment output video carrier to noise ratio shall be 50 dB minimum.

M. The off-air received signal to noise ratio at each video outlet shall be 47 dB minimum.

N. Picture quality tested at each video location shall be of equal quality as the video head-in equipment picture quality.

O. Picture quality at each location shall be the same regardless of the number of TV monitors connected to the system.

P. The Contractor shall, after the system is installed and adjusted, notify the engineer(s) to arrange for an acceptance test at a mutually convenient time. At this time, the Contractor shall have documentation indicating the installation meets FCC Cumulative Leakage Index (CLI) requirements of five (5) microvolts per meter at ten (10) feets.

Q. The Contractor shall provide that reception quality at any outlet selected by the Engineer(s) is equal to or better than the reception normally available in that geographical area and that the signal strength measured at that system outlet is within specification.

R. The system shall deliver a minimum of minus three (-3) dBmv and a maximum of plus four (+4) dBmv signal strength to each system outlet. This condition shall be met regardless of the number of televisions (receivers) connected. The signal level at each video outlet shall be 6 dBmv.

S. The system shall provide the highest regard to system integrity and meet FCC, NCTA and SCTE requirements for signal leakage.

T. The system shall pass all channels without noticeable degradation of intelligence and color fidelity

U. The system shall consist of UL approved equipment and be capable of continuous unattended operation.

V. Each video outlet shall be tested for continuity, shorts and grounds.

W. The signal measured by a signal strength meter at any video outlet in the school shall be between +2dB and +8dB. All video outlets in the school shall be tested end-to-end between the video jack in a room and the video head-end equipment.

X. The system shall provide the highest regard to system integrity and meet FCC, NCTA and SCTE requirements for signal leakage.

2.5 Satv Headend equipment and Dish Required:

A. QTY Per Drawing D-12 Direct TV Satellite Receiver

B. RR-6/8 RX UNIVERSAL 19" Rackmount Receiver Chassis holds 6or8 D-12

C. TSMS2150X-8 Multi-switch 8 way

D. DISH Kit patriot part # 62100050 Antenna 1.0M W/ 2- 3/8"ODWith 611613101 2-3/8" AZ/EL Mount & 610006850 LNBF Bushing kit.

E. (1) DTV32 LNBF-DUAL 30 MM Throat

F. (1) CHA-WR238 WALL/ROOF MNT 2-3/8"

G. Provide Blonder Tongue model # AMCM-860 Agile Micro Mod (1) per modulated channel

2.6 DISTRIBUTION COMPONENTS

A. Signal Power Splitters and Isolation Taps: Metal-enclosed directional couplers with brass connector parts. Where installed in signal circuits used to supply cable-powered amplifiers, power throughput capacity shall exceed load by at least 25 percent.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Canare Corp.
    b. Leviton Manufacturing Co., Inc.; Leviton Voice & Data Division.
    c. Motorola, Inc.; Connected Home Solutions.
    d. Quality RF Services, Inc.; a member company of ATX Networks.
    e. Scientific-Atlanta, Inc.; a subsidiary of Cisco Systems, Inc.

2. Return Loss: 17 dB.
3. RFI Shielding: 100 dB.
4. Isolation: 25 dB.
5. I/O Impedance: 75 ohms.

B. Distribution System Amplifiers: Powered by coaxial cable system and equipped with surge protection device and external test points to allow convenient signal monitoring.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Canare Corp.
    b. Leviton Manufacturing Co., Inc.; Leviton Voice & Data Division.
    c. Motorola, Inc.; Connected Home Solutions.
    d. Quality RF Services, Inc.; a member company of ATX Networks.
    e. Scientific-Atlanta, Inc.; a subsidiary of Cisco Systems, Inc.

C. Cable System Power Supplies: Plug-in, modular construction, with surge, short-circuit, and overload protection.

D. Signal Traps: Packaged filters tuned to interference frequencies encountered in Project.

E. Attenuators: Passive, of fixed value, and used to balance signal levels.

F. Terminating Resistors: Enclosed units rated 0.5 W and matched for coaxial impedance.

G. User-Interface Device: Flush, female-type outlets, designed to mimic power duplex outlet; for mounting in standard outlet box; with metallic parts of anodized brass, beryllium copper, or phosphor bronze. Cable connector mounting shall be semirecessed so its protrusion is flush with the plane of device plate.[Feed-through-type cable connection shall not be used] [except in area housing a single tenant] [except within a single-dwelling unit].

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Canare Corp.
    b. Leviton Manufacturing Co., Inc.; Leviton Voice & Data Division.
    c. Motorola, Inc.; Connected Home Solutions.
    d. Quality RF Services, Inc.; a member company of ATX Networks.
    e. Scientific-Atlanta, Inc.; a subsidiary of Cisco Systems, Inc.

2. Cable Connector: Female, Type F.
3. Wall Plates: Match materials and finish of power outlets in same space.
4. Attenuation: Less than 0.1 dB.
5. Voltage Standing-Wave Ratio: Less than 1.15 to 1.

2.7 ENCLOSURES

A. Enclosures for Interior, Controlled Environments: NEMA 250, Type 1.

B. Enclosures for Exterior Environments: NEMA 250, Type 3R.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in for antenna to verify actual locations of cable connections before antenna installation.

B. Examine walls, floors, roofs, equipment bases, and roof supports for suitable conditions where television equipment is to be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install signal line surge suppressors on coaxial cables entering headend equipment space and at antenna-mounted amplifiers. Comply with requirements in Division 26 Section "Transient-Voltage Suppression for Low-Voltage Electrical Power Circuits."

B. Install antenna towers, masts, and mountings on concrete bases. Comply with requirements for concrete bases specified in Division 03 Section "Cast-in-Place Concrete."

1. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
2. Install anchor bolts to elevations required for proper attachment to supported equipment.

3.3 ANTENNA AND HEADEND INSTALLATION

A. Mount headend equipment in electronic-equipment cabinets recommended by manufacturer. Group related items in methodical sequence.

B. Arrange equipment to facilitate access for maintenance and to preserve headroom and passage space. Parts that require periodic service or maintenance shall be readily accessible. Headend components that require tuning adjustments shall be accessible from the front of equipment cabinets.

C. Align antenna elements to achieve maximum signal level and quality.

D. Antenna-Supporting Structure: Increase antenna height as required to obtain signal strength needed for specified system performance.

1. Attachment to Building: Use 0.375-inch- (minimum expansion anchors for masonry, and place anchors clear of grout or mortar joints.
2. Attachment to Building: Use 0.375-inch- minimum lag bolts for attachment to wood.
3. Lightning Protection: Comply with requirements in Division 26 Section "Lightning Protection for Structures."

E. Antenna Cable Entrance: Use weatherproof entrance fittings, and seal at penetrations of the building envelope.

3.4 IDENTIFICATION

A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Division 26 Section "Identification for Electrical Systems."

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

B. Perform tests and inspections.

1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

C. Inspection: Verify that units and controls are properly installed, connected, and labeled, and that interconnecting wires and terminals are identified.

D. Tests and Inspections:

1. Align and adjust system and pretest components, wiring, and functions to verify that they comply with specified requirements.
2. Replace malfunctioning or damaged items.
3. Retest until satisfactory performance and conditions are achieved.
4. Prepare television equipment for acceptance and operational testing.
5. Use an agile receiver and signal strength meter or spectrum analyzer for testing.
6. Off-Air, Mast-Mounted Antenna Sources: Connect receiver to the down-lead of a 10-element, single-channel antenna, tuned and oriented to optimize reception for the channel and placed at system antenna's location. Alternatively, connect receiver to a single-channel video amplifier connected to the down-lead of the above single-channel antenna.
7. CATV Sources: Connect receiver to an agile demodulator or CATV set-top converter at CATV service entrance to the facility.
8. Satellite Earth-Station System Sources: Adapt receiver to the output of satellite-television receiver.
9. CCTV Sources: Connect receiver to the output of each CCTV signal source or the distribution amplifier associated with it.
10. Test Schedule: Schedule tests after pretesting has successfully been completed and system has been in normal functional operation for at least 14 days. Provide a minimum of 10 days' notice of test schedule.
11. Operational Tests: Perform tests of operational system to verify that system complies with Specifications. Include all modes of system operation. Test equipment for proper operation in all functional modes.
12. Distribution System Acceptance Tests:

    a. Field-Strength Instrument: Rated for minus 40-dBmV measuring sensitivity and a frequency range of 54 to 812 MHz, minimum. Provide documentation of recent calibration against recognized standards.
    b. Signal Level and Picture Quality: Use a field-strength meter or spectrum analyzer, and a standard television receiver to measure signal levels and check picture quality at all user-interface outlets.

        1) Test the signal strength in dBmV at 55and 750 MHz.
        2) Minimum acceptable signal level is 0 dBmV (1000 mV).
        3) Maximum acceptable signal level over the entire bandwidth is 15 dBmV.
        4) Television receiver shall show no evidence of cross-channel intermodulation, ghost images, or beat interference.

13. Signal-to-Noise-Ratio Test: Use a field-strength meter to make a sequence of measurements at the output of the last distribution amplifier or of another agreed-on location in system. With system operating at normal levels, tune meter to the picture carrier frequency of each of the designated channels in turn and record the level. With signal removed and input to corresponding headend amplifier terminated at 75 ohms, measure the level of noise at same tuning settings. With meter correction factor added to last readings, differences from first set must not be less than 45 dB.
14. Qualitative and Quantitative Performance Tests: Demonstrate reception quality of color-television program transmissions at each user interface from each designated channel and source. Quality shall be equal to or superior than that obtained with performance checks specified below, using a standard,

commercial, cable-ready, color-television receiver. Level and quality of signal at each outlet and from each service and source shall comply with the following Specifications when tested according to 47 CFR 76:

a. RF video-carrier level.
b. Relative video-carrier level.
c. Carrier level stability, during 60-minute and 24-hour periods.
d. Broadband frequency response.
e. Channel frequency response.
f. Carrier-to-noise ratio.
g. RF visual signal-to-noise ratio.
h. Antenna combiner insertion loss.
i. Signal power splitter loss.
j. Cable connector attenuation.
k. Cross modulation.
l. Carrier-to-echo ratio.
m. Composite triple beat.
n. Second order beat.
o. Terminal isolation.
p. Terminal isolation between television and FM.
q. Hum modulation.
r. RF FM carrier level.
s. FM frequency response.
t. FM carrier-to-noise ratio.

E. Headend and distribution system will be considered defective if they do not pass tests and inspections.

F. Prepare test and inspection reports.

G. For fiber-optic- and UTP-cable performance test, see Division 27 Section "Communications Horizontal Cabling."

H. Cap all unused connectors and seal weathertight.

3.6 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain MATV equipment.

1. Train Owner's maintenance personnel on procedures and schedules for troubleshooting, servicing, and maintaining equipment.
2. Demonstrate methods of determining optimum alignment and adjustment of components and settings for system controls.
3. Demonstrate programming and tuning of satellite receivers.

B. Refer Division 01 for administrative and procedural requirements for demonstration and training.

END OF SECTION 274133

SECTION 27 52 23 – NURSE CALL SYSTEM

PART 1 - GENERAL

1.1 OVERVIEW

A. Furnish and install all equipment, accessories, and materials in accordance with these specifications and drawings to provide a complete and operating Nurse/Patient Communications System for the Youth Detention Center.

B. All bids shall be based on the equipment as specified herein. The catalog numbers, model designations and descriptions are those of the RAULAND-BORG CORPORATION. Any alternate system must be approved in advance by the specifying authority. Final approval of the alternate system shall be determined at the time of job completion. Failure to provide the "precise functional equivalent" shall result in the removal of the alternate system at the contractor's expense.

1.2 SCOPE OF WORK

A. Furnish and install a Nurse / Patient Communications System comprised of nurse consoles, patient stations, dome lights, entertainment cords, call cords, pull cord stations, emergency push button stations, bed side-rail interfaces, pocket page interfaces, computer interfaces, printer interfaces, wireless/telephone network interfaces and wiring as shown on the drawings

B. The Nurse/Patient Communications System shall be installed initially in the specified areas and then be expanded in the future to additional areas. Systems provided in the initial area shall have the capacity to expand to provide seem-less service to the entire facility.

C. All necessary equipment required to meet the intent of these specifications, whether or not enumerated within these specifications, shall be supplied and installed to provide a complete and operating nurse/patient communications network.

1.3 REFERENCES

A. Underwriter's Laboratories Standard 1069 (UL1069)

B. Canadian Standards Association

C. National Electrical Code

D. U.S. Dept. of Labor / Occupational Safety and Health Administration

E. State Hospital Code / Joint Commission of Hospitals - Nurses Call Requirements

F. European Union's *DIRECTIVE 2002/95/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 27 January 2003*, commonly known as the RoHS Directive

G. European Union Medical Device Directive 93/42/EEC (MDD)

H. CE Marking for Conformity of Medical Devices (Article 17, 93/42/EEC)

I. CE Marking for Conformity (Council Directive 93/68/EEC)

J. 21 CFR 820 Part 820 Quality Systems Regulations (FDA)

1.4 SYSTEM SUPPLIER QUALIFICATIONS

A. The System Supplier shall be an established communications and electronics contractor that has had and currently maintains a locally run and operated business for at least five years. The System Supplier shall hold all applicable state and local licenses.

B. The System Supplier shall be an Authorized Distributor for the product proposed with full manufacturer's warranty privileges.

C. The System Supplier shall employ technicians who have attended and successfully completed the manufacturer's technical certification classes for the proposed system.

D. The System Supplier shall show satisfactory evidence, upon request, that he maintains a fully equipped service organization capable of furnishing adequate inspection and service to the system on a 24-hour / 7-day basis. The System Supplier shall maintain at his facility the necessary spare parts in the proper proportion as recommended by the manufacturer to maintain and service the equipment being supplied.

1.5 SUBMITTALS / PRIOR APPROVAL

A. System Suppliers wishing to submit equipment other than that specified shall submit to the specifying authority, at least 10 days prior to bid opening, the equipment proposed to provide a precise functional equivalent system to meet specifications. Bidder shall provide adequate information prior to bid date such as specification sheets, working drawings, shop drawings, and a demonstration of the system. Alternate supplier-contractor must also provide a list to include six installations of the identical system proposed which have been in operation for a period of two or more years.

B. Prior to commencement of work, the supplying contractor shall submit six (6) complete submittal sets. These sets are to be submitted in a three ring binder, a continuous spiral binder, or plastic binding that allows the booklet to lie flat while open. Each booklet shall consist of the following:

Page 1: Name of System Supplier and project name

Page 2: In the following order, a listing of: component quantities, equipment manufacturer, model number, and description of each component being supplied. If equipment being supplied is not the specified equipment manufacturer's model, alongside the submitted model number and description, list the specification paragraph that corresponds to the equivalent specified model. Failure to provide this information will result in the rejection of submittals.

Page 3: Recently dated (within one year from submittal date) support letter from manufacturer stating that the supplying contractor is an Authorized Distributor of the product being supplied.

Page 4: Statement of warranty policy from manufacturer.

Page 5: Copy of the installing technician(s) certificate of completion from the manufacturer's training school for the equipment being proposed.

Page 6: Statement by System Supplier of how and when they will complete In-Service Training, including the exact number of hours being provided per system, procedures they will follow, what training aids are provided (manuals, video tapes, etc.) and how contractor will conduct training.

Page 7: Statement from System Supplier of exactly how they will test installed equipment and wiring, including recommendations by manufacturer, prior to commissioning of system.

Page 8: Provide a list of recommended spare parts to maintain all systems specified after the warranty period. Also provide the purchase price and turn around cost associated with each item. List separately the cost of an annual maintenance contract based on service levels outlined in WARRANTY paragraph of this section. Show the hourly, purchased labor rates for both regular and emergency service. State any additional charges that may accompany labor charges such as travel charges.

Pages 9+: One catalog sheet per product of equipment listed on page 2; in the exact order as listed on page 2. Each catalog sheet shall describe, mechanical, electrical and functional equipment specifications. The catalog sheet must also include a photograph of the product. Photocopy duplications of the manufacturer's original equipment catalog sheets will be allowed as long as they provide adequate clarity of both the printed word and graphics/pictures. Submittals that are not of adequate clarity or content may be rejected and re-submission may not be allowed.

Last Page(s) or Separate: Provide all inter-equipment wiring diagrams and drawings necessary to install the equipment being supplied. These drawings will show all wiring types by wire gauge, conductors and wire manufacturer. These drawings must be updated prior to completion of any work to reflect changes that may have been made during actual installation.

B. In the event the specifying authority deems it necessary to reject the submittals of a System Supplier, the specifying authority may ask the System Supplier to re-submit if the discrepancies are minor. Otherwise rejection of submittals means the specified product must be supplied.

1.7 SYSTEM DEMONSTRATIONS

A. It may be necessary to utilize demonstration equipment to test the functional operation of the System Supplier's submitted equipment. System Supplier will be notified of any demonstration dates and times. If such demonstrations are utilized, it will be the sole judgment of the owner and specifying authority to decide whether a contractor/manufacturer meets or exceeds the specification.

B. All demonstrated equipment must be that of a standard single manufacturer and meet the same required testing and conditions that are applicable to the manufactured equipment. Custom or modified equipment that is not of standard, current manufacture cannot be demonstrated.

C. If necessary, owner and/or specifying authority may visit manufacturer's facility to view functioning equipment or demonstrations and witness equipment manufacturing techniques and/or testing procedures.

1.8 SAMPLES

A. The owner/specifying authority reserves the right to request samples of terminal (station) equipment for the purpose of coordinating colors, aesthetics, trimplate sizing, etc. These samples would be supplied at no cost to the owner.

1.9 SCHEDULING

A. It is the responsibility of the System Supplier to coordinate all work with the other trades for scheduling, rough-in, and finishing all work specified. The owner will not be liable for any additional costs due to missed dates or poor coordination of the supplying contractor with other trades.

1.10 WARRANTY

A. The System Supplier shall provide a warranty on the system which shall include all necessary labor and equipment to maintain the system(s) in full operation for a period of one year from the date of acceptance.

B. In addition, the equipment (parts) warranty for all core system components including control / switching equipment, power supplies, patient stations, sub-stations, and nurse consoles shall extend to a total of at least five (5) years. Warranty for ancillary devices such as pillow speakers and call cords shall extend to a total of at least two (2) years.

C. Manufacturer shall provide, free of charge, product firmware/software upgrades throughout the warranty period for any product feature enhancements.

D. After the acceptance of the system(s) service shall be provided on the following basis:

Emergency Service -	Provided **24 hours a day**. When a **total or catastrophic failure** of equipment is reported to contractor, within **2 hours of notification**, a service person will be on site. (An example of a catastrophic failure would be a hub failure or a nurse console failure.)
Routine Service -	Provided **within 4 business hours** (9 a.m. to 5 p.m., Monday through Friday, excluding holidays) **of notification**. When a minor failure or equipment is reported to contractor, a service person will be on site within 24 hours of notification. (An example of a minor failure includes peripheral equipment such as control stations, entertainment speakers, corridor lights, pull-cord stations, etc. which normally affect only one patient or patient room.)

1.11 MAINTENANCE

A. Provide necessary spare parts, noted on Page 8 of submittal (see 1.05A), after commissioning of system(s) and prior to final payment.

B. The owner may choose to have the supplying contractor maintain the system(s). The level of service provided during the maintenance contract period would be the same as the warranty period for routine and emergency service. All labor and equipment costs would be covered under this contract. Supplying contractor must state exact billing amounts, billing periods and all costs associated with this maintenance agreement and list any items that would not be covered under the service/maintenance agreement.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. The equipment specified herein is that of the RAULAND-BORG CORPORATION, SKOKIE, ILLINOIS.

B. The intent is to establish a standard of quality, function and features. It is the responsibility of the bidder to ensure that the proposed product meets or exceeds every standard set forth in these specifications.

C. The functions and features specified are vital to the operation of this facility, therefore, inclusion in the list of acceptable manufacturers does not release the System Supplier from strict compliance with the requirements of this specification.

2.2 QUALITY ASSURANCE

A. The nurse / patient communications system shall be listed by Underwriter's Laboratories under UL Standard 1069 - 6th Edition (published March, 2001). Underwriter's Laboratories shall be the only acceptable NRTL for system listing.

B. The nurse / patient communications system shall be compliant with European Union Medical Device Directive 93/42/EEC (MDD).

C. The nurse / patient communications system shall be compliant with CE Marking for Conformity of Medical Devices, in compliance with Article 17 of Medical Device Directive 93/42/EEC (MDD), and EU Council Directive 93/68/EEC.

D. The nurse / patient communications system shall be supplied by an FDA-registered medical device manufacturer, and shall list their device in accordance with the provisions set forth in 21CFR Part 890.3710 or 890.3725, Class II Medical Device.

E. The nurse / patient communications system shall be in compliance with European Union's *DIRECTIVE 2002/95/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 27 January 2003*, commonly known as the RoHS Directive.

2.3 SYSTEM WIRING

A. System wiring and equipment installation shall be in accordance with good engineering practices as established by the EIA and the NEC. Wiring shall meet all state and local electrical codes.

1. Contractor shall terminate all wiring with manufacturer approved connectors. The use of wire nuts is prohibited.

2. System shall employ a structured cable system consisting of standard 4-pair Category 5 cable to service all corridor lamps, and consoles.

3. All wiring shall test free from all grounds and shorts.

4. Wiring shall be UL listed, NEC and NFPA 70, Article 25 approved.

5. Nurse / Patient Communications System wiring shall not be run in the same conduit with other systems (i.e. Class 1 AC power distribution, fire alarm, entertainment systems, lighting controls, etc.).

2.4 SYSTEM FIRMWARE / SOFTWARE MAINTENANCE

A. The System Manufacturer shall provide, free of charge, product firmware / software upgrades for a period of five years from date of installation for any product feature enhancements. Installation of system upgrade software shall be by the System Supplier and shall be per the labor warranty specified elsewhere.

1. System firmware / software upgrades shall be downloaded to the system by data connection. Upgrades shall be accomplished system-wide from a single point of connection.

2. Systems requiring local programming of individual network components / sub-systems at multiple physical locations or which do not allow for remote download of component firmware or which require the exchange of components, will not be accepted.

2.5 HEAD-END CONTROL EQUIPMENT

A. Power Supplies – Provide ample power for control equipment, consoles, patient stations, sub-stations, and corridor lamps. All system power supplies must be UL1069 listed as an integral part of the core system. Power supplies which carry only component listings or are otherwise not part of the core system UL listing are not acceptable.

B. Battery Back-up – Provide battery back-up with ample reserve power to operate the entire system for a minimum of 10 minutes without operational limitations or loss of system function.

C. Furnish as needed in each area a nurse/patient communications network hub controller. The system as a whole shall be capable of supporting at least 25 hub controllers. Each hub controller shall provide the following:

1. Support for at least 10 console clusters consisting of standard LCD consoles or annunciate panels.

2. Support for at least 150 rooms.

D. It shall be possible for network hub to act as stand alone controller should loss of network communication occur.

E. System Audio – The system shall be designed to provide audio meeting the minimum standards detailed by the National Electrical Manufacturers Association standard for nurse call system audio.

1. The system shall utilize 25 Volt balanced signal distribution between head end equipment and room stations.

2. Audio transmission between hub controllers shall be digital.

2.6 CALL ROUTING / PROCESSING

A. Call Routing – The system shall support the routing of patient calls to any console, pager, phone or other annunciating device anywhere in the facility or to any combination of the above regardless of the location of the calling station. Calls may be routed and processed based on location, priority or combination.

1. The system shall support the ability to swing any individual room or any group of rooms by touching one labeled touch point. Room(s) and consoles may be located anywhere within hospital nurse/patient communications network.

2. The system shall allow a console to capture an individual nursing unit, selected units, or all units in hospital by touching single custom labeled touch point.

B. Call Priorities – The system shall support a minimum of 200 unique, user-definable call priorities.

1. Each call priority shall be reported via a user-defined mnemonic of up to 14 alphanumeric characters.

2. Selectable call-in tone type, level, and corridor light behavior for each type of call priority.

2.7 STAFF REGISTRATION

A. The system shall support staff registration. Staff members may, by pressing a dedicated button when entering a room, indicate their presence to the system. Staff presence in the room shall be indicated by illuminating the room's green corridor lamp.

1. Users may review the location of staff members using an LCD Console and / or an Annunciate Panel.

2. If a call or service requirement is present in the room when a staff member registers into the room, the system shall automatically cancel the call(s).

3. If a call is placed from a room in which a staff member is already registered, the system shall be capable of automatically upgrading the priority of that call to indicate the need for staff assistance.

2.8 SERVICE REQUIREMENTS

A. The system shall support service requirement reminders. Staff members may, by pressing a button on the console, initiate a service requirement reminder.

1. Service Requirements shall be indicated on the corridor lamp by a flashing lamp.

2. Users may review the location of service requirements using an LCD Console and / or an Annunciate Panel.

3. If a service requirement remains unanswered for a pre-determined period of time, an overtime call shall automatically be initiated.

2.9 STAFF FOLLOW

A. The system shall support manual or automatic Staff Follow functions. When Staff Follow is enabled, call-tones for a prescribed area will automatically be forwarded to the room station speaker where staff members are located. Staff location may be determined manually by entering the room number into the console or automatically using staff register stations. Pressing the call button on that station shall silence the tones. When a new call is placed, the tones shall automatically be restored.

2.10 ROOM MONITORING

A. The system shall allow staff members to audibly monitor selected rooms.

B. Manual Monitor – Staff members may listen in to a selected room.

C. Sequential Monitor – Staff Members may enter a selected group of rooms for monitoring. The system will automatically switch from room to room allowing the staff member to sequentially monitor the rooms.
1. During monitoring, the staff member may press a button on the console to stop on the current room to listen longer and then press Resume to restart the sequencing.

2. The staff member may adjust the time that the system spends on each room.

3. During Sequential Monitoring, the number of the room currently being monitored shall appear on the console.

2.11 ROOM PRIVACY

A. The system shall allow staff members to place a room in Privacy Mode to prevent unauthorized or accidental audible monitoring of the room.

B. Rooms may be entered into or removed from Privacy by staff members using the console.

C. When a room that is in Privacy is dialed from a console or telephone, the staff member may speak into the room but they may not listen to the room.

1. Privacy in the room may be temporarily suspended to allow two-way communications by pressing the call-in button in the room. When the conversation is terminated, Privacy shall automatically be restored.

2. If a call-in is placed from the room, the call may be answered from the console as normal using two-way communications.

D. The rooms in privacy may be reviewed from the LCD console.

1. During the review process, rooms may be removed from Privacy mode.

2.12 AUDIO PAGING

A. The system shall support audio paging from selected consoles.

B. All Page - Paging announcements may be made from a console to all room stations in the system.

C. Group Page – Announcements may be made to all room stations within a console’s coverage area.

D. Staff Page – Announcements may be made to rooms in which staff members are registered.

E. Paging Announcements may be made to overhead speakers via a connection to the facility Public Address System.

F. To facilitate a low noise patient environment, the system will support the ability to block paging from selected consoles.

1. Consoles equipped with dial pads may be configured to allow password protection of the paging function to only allow authorized access to audio paging.

2.13 CONSOLES / ANNUNCIATOR PANELS

A. System consoles shall be provided as indicated on the plans and drawings. All system consoles shall be UL1069 listed as an integral part of the core system. Telephones, personal computers or other devices which carry only component listings or are otherwise not part of the core system UL listing are not acceptable.

B. LCD consoles:

1. The LCD console shall be a small self-contained unit, which shall not occupy more than 87 square inches of desk space. The console shall include an easy-to-read 4-line / 80-character backlit LCD display.

2. The console shall provide function selector buttons and a telephone-style 12-button dial pad. Selector buttons may be used to access user-configured 24-function menu.

3. The console may display up to three incoming calls each with an individual elapsed timer indicating how long the call has been pending. Ability to scroll to see additional pending calls.

4. While idle, the console shall display the time of day. Time may be displayed in 12 or 24-hour format. Time display shall be consistent system wide.

5. Console shall include capabilities for both open voice (speaker / microphone) and telephone style handset. Audio direction (talk / listen) for speaker / microphone and handset may be accomplished via automatic voice switching (VOX) or manually via a Push-to-Talk button.

6. The highest priority (or longest pending) call may be answered automatically by lifting the handset or by pressing the Push-to-Talk button. Calls may be answered out of sequence using line selector buttons or by dialing the desired room number.

7. Console shall provide independent volume controls for day/night call-in tones. A Mute button shall be provided to temporarily suppress tones for pending calls.

8. The console may be desk or wall mounted.

9. The console shall employ a modular quick-disconnect connector. It shall be possible to remove and / or replace the console without removing power from the system.

2.14 CORRIDOR LAMPS / ROOM CONTROLLERS / ZONE LAMPS

A. Corridor Lamps shall be provided as indicated on the plans and drawings.

B. High Security Corridor Lamps (1-lamp, 2-lamp, and 3-lamp style)

1. 11-gauge stainless steel faceplate with a mar-resistant brushed finish

2. Corridor Lamp shall include one, two, or three bulb(s) whose color(s) may be established using a colored filter.

   a. The corridor lamp shall make use of multiple colors and programmable flash rates and patterns to indicate pending calls, service requirements and staff presence.

   b. Lamp colors are established by colored filter, so that only one common replacement bulb is required.

3. Corridor Lamp shall include tamper-proof mounting hardware.

4. The High Security Corridor lamp shall operate in conjunction with a solid-state relay output controller and a domeless controller that serves as the hub for all room wiring.

2.15 HIGH SECURITY ROOM STATIONS

A. Room Stations (single or dual) shall be provided as indicated on the plans and drawings.

B. Room Stations shall be equipped with:

1. 11-gauge stainless steel construction.

2. Heavy-duty, tamper-proof ¼ inch jack style receptacle(s) for call cord.

3. Stations in areas requiring two-way communication shall be equipped with a speaker microphone with level matching transformer.

a. Vandal-proof speaker mounting design

b. Minimum speaker size shall be 3.0” / 7.6 cm

4. Heavy-duty, tamper-proof Reset Button to cancel pending calls. Reset button shall be able to cancel calls from other stations in the room if desired.

5. Green LED to indicate that audio to the station is active.

6. Red LED(s) to indicate call placement from one or both of the call points.

C. Room Station functions shall include:

1. Removing a call cord shall place a Cord Out call.

a. Cord Out calls may be cancelled locally using the Cancel Button. No Dummy Plugs shall be required.

D. Room Stations shall employ modular connectors. It shall be possible to service Room Stations without removing power from the system.

E. Room Stations shall have the capabilities to interface with the patient bed. Interface shall allow lighting and nurse call controls via the patient bed rails.

F. Patient station shall interface with patient room low voltage lighting controller for control of patient light via the patient bed rail controls and/or the patient pillow speaker.

2.16 SUB-STATIONS

A. Provide Sub-stations as indicated on the plans and drawings. Sub-station types shall include:

B. High Security Single Call Pushbutton Stations – High Security Single Call Pushbutton stations shall be equipped with a call button and reset button.

1. Heavy-duty, tamper-proof Call Button shall be red in color and shall be large (minimum 1.25” / 3.2 cm) for easy use.

2. Heavy-duty, tamper-proof Reset button shall be able to cancel calls from other stations in the room if desired.

3. Station shall be water-resistant for shower and bath applications.

4. Station shall be constructed with 11-gauge stainless steel.

2.17 PATIENT CALL CORDS

A. Patient Call Cords shall be provided as indicated on the plans and drawings. All Patient Call Cords shall be UL1069 listed as an integral part of the core system. Devices which carry only component listings or are otherwise not part of the core system UL listing are not acceptable.

1. Standard Call Cords – Standard Call Cords shall be pendant type with a single easy to activate call button, DIN style male plug and sheet clip. Cable shall be a minimum of 10' / 300cm. One (1) standard call cord shall be provided for each bed with an additional 10% provided as spares.

2.18 POCKET PAGE INTEGRATION

A. The Nurse / Patient Communications System shall be integrated with the facility pocket page system (specified elsewhere) to provide messaging from the system to pagers.

B. Integration / connection shall be accomplished serially via RS-232C using the Telocator Alphanumeric Protocol (TAP) Version 1.8. Should the distance between the Nurse / Patient Communications System and the Pocket Page encoder exceed 50' / 15m, provide short haul modems to ensure signal transmission integrity.

C. Automatic Mode Operation – The system shall support Automatic Mode Operation. In this mode, patient calls shall be routed directly to the pocket pager of the designated staff member. Room number, bed number and call priority shall be sent with the page message.

D. Semi-automatic Mode Operation – The system shall support Semi-automatic Mode Operation. In this mode, a console operator may answer patient call, determine the patient need and then dispatch an appropriate staff member.

1. Dispatching the staff member shall be accomplished by establishing a service requirement. The page will then be sent to the pager of the designated staff member. It shall not be necessary to enter pager numbers to route the page message. When sent by Semi-automatic mode, the page message shall include the room number, bed number, call priority plus an indication that a Service Requirement has been set.

E. Pagers shall be able to run in both Automatic Mode and Semi-automatic Mode simultaneously.

F. Equipment Trouble Pagers – The system shall support up to 10 pagers that receive a message whenever there is trouble in the system such as a console off-line or station off-line.

2.19 WIRED / WIRELESS TELEPHONE INTEGRATION

A. The Nurse / Patient Communications System shall be integrated with the facility telephone system to provide connectivity with wired and / or wireless telephones. Integration shall include the ability to display information on telephone displays as well as the ability to establish audio communications between the telephone and the patient room station.

B. The system shall be capable of providing standard Type II ICLID (Caller ID) signaling for connection to ICLID enabled telephone systems or Caller ID single / multi-line telephones.

C. The system shall also support connection to telephone systems using a serial data (RS-232C) connection. The Telocator Alphanumeric Protocol (TAP) Version 1.8 shall serve as the integration standard. Should the distance between the nurse / patient Communications System and the Pocket Page encoder exceed 50' / 15m, provide short-haul modems to ensure signal transmission.

2.20 REPORTING SOFTWARE

A. Reporting Software shall be provided with the system to allow for recording and reporting of system activity.

B. The Reporting Software shall be installed on a Personal Computer which shall in turn be connected to the Nurse / Patient Communications System.

C. Reporting Software shall support real time system activity display.

1. Real time call waiting display with the ability to filter by call types and nursing units. Call information shall be displayed and call-in tones shall be sounded.

2. Real time Nurse Communications Network service reminder display and staff locations.

3. Should the connection between the nurse / patient communications system and the Reporting Software PC be lost, a warning signal shall be generated by the Reporting Software.

D. Reporting Software shall allow users to generate / print reports on system activity. Access to reports shall be controlled based on user name and password. Reports shall be capable of indicating call priority, room number and patient information, call placed time, service reminder set, staff registration.

1. Reporting Detailed Analysis of Call Data by Area

2. Analysis of Call Data by Area

3. Analysis of Call Data by Room/Bed

4. Analysis of Call Data by Resident

5. Resident Check-In Exception

E. Reporting Software shall support a networked operation in which the Management Software PC is connected to the hospital LAN. Users with access to the LAN can then generate reports from local work stations.

2.21 CHASSIS FAULT, POWER MONITOR, AND SUPERVISED CODE

A. Provide a separate chassis short / power fault monitor to monitor integrity of network wiring for short(s) to earth ground and to notify staff of loss of power. An audible alert tone shall sound if short or loss of power is detected. Provide test button to test operation.

2.22 SYSTEM DIAGNOSTICS

A. The system shall provide continuous self-diagnostics. The system shall also support advanced computer diagnostics by local or remote technical personnel.

B. All components in the system shall be continuously supervised for both power and signal to ensure proper operation and in the case of system faults to aid in troubleshooting.

C. The system shall have the ability to diagnose all network active components, controllers, control stations, and sub-station operation from any designated network data interface location, on or off site. Network administrator shall be able to:

1. Review system faults reported (i.e. station failure)

D. The system shall provide the ability to automatically notify maintenance personnel via pocket page in the event of a system trouble or failure.

2.23 LOW VOLTAGE LIGHTING CONTROLLER

A. Low voltage controller shall be Vista model 90676-NRF. Low voltage controller shall integrated solid state unit. The low voltage controller shall be suitable for 120/277VAC. Low voltage controller shall allow control of line voltage devices through low voltage switching devices. Low voltage controller shall be suitable for momentary switch operation with the option to operate the relays in a sequential mode or individual mode.

PART 3 - EXECUTION

3.1 SUPERVISION

A. System shall be installed, maintained and serviced by or under the supervision of manufacturer certified technicians

3.2 IN-SERVICE TRAINING

A. The System Supplier shall provide thorough training of all nursing staff assigned to those nursing units receiving new nurse/patient communications equipment. This training shall be developed and implemented to address two different types of staff. Floor nurses/staff shall receive training from their perspective, and likewise, unit secretaries (or any person whose specific responsibilities include answering patient calls and dispatching staff) shall receive operational training from their perspective. A separate training room will be set up that allows this type of individualized training utilizing in-service training unit, prior to cut over of the new system.

3.4 ELECTRICAL POWER CONNECTIONS

A. It shall be the responsibility of the facility to provide a dedicated 120 VAC, 60 HZ conduit feed into the equipment cabinet. This power feed shall not have any other devices connected directly to it. A 20 AMP circuit breaker located in the electrical sub-panel labeled “nurse call” will control this circuit. This electrical circuit will be connected to the facility’s emergency power system for automatic power switch over during loss of utility power.

B. Connect all network system power supplies and equipment cabinets to a common earth ground utilizing a 14 AWG, or larger, solid conductor which is at minimum the same conductor size as the AC feed wires.

3.6 PROTECTION OF NETWORK DEVICES

A. Contractor shall protect network devices during unpacking and installation by wearing manufacturer approved ESD wrist straps tied to chassis ground. The wrist strap shall meet OSHA requirements for prevention of electrical shock, should technician come in contact with high voltage.

3.7 CLEANING AND PATCHING

A. It shall be the responsibility of the System Supplier to keep their work area clear of debris and to clean the area at completion of work each day.

B. It shall be the responsibility of the contractor to patch and paint any wall or surface that has been disturbed by the execution of this work.

3.8 DRAWINGS

A. Provide as built drawings of all installed network components and associated wiring on building plans. Final payment for work will not be authorized unless these drawings are supplied.

END OF SECTION

SECTION 28 05 00 - COMMON WORK RESULTS FOR ELECTRONIC SECURITY

PART 1 GENERAL

1.1 DESCRIPTION OF WORK

A. Provide all labor, equipment, supplies and materials for the complete installation of a fully functional Security Control System in accordance with the Contract Documents. Security Systems include but are not limited to:

1. Backbone and Horizontal Cabling
2. Grounding and Bonding
3. Cabinets and Enclosures
4. Video Surveillance System
5. PLC/GUI Hardware and Software
6. Access Control System
7. Intercom System
8. Miscellaneous Systems

B. The work includes the following, as well as work not listed below but described elsewhere as it applies to Security Systems:

1. Coordination with division 26
2. Field device installation and termination
3. Headend equipment installation and termination
4. Programming
5. Start up, testing, de-bugging and commissioning
6. Documentation and training
7. Maintenance and service

C. Interpretation of Contract Documents

1. This section of the specifications describes general provisions applicable to all Division 28 Security Systems.
2. Although such work is not specifically indicated, furnish and install all supplementary or miscellaneous items, appurtenances and devices incidental to or necessary for a sound, secure and complete installation.
3. Mention in these specifications or indications and/or reasonable implications whereby articles, materials, operation or methods related to execution of the work are noted, specified, drawn or described, thereby requires execution of each such item of work and provision of all labor, materials, equipment and accessories required for execution thereof.
4. No exclusions from, or limitations in the language used in the specifications shall be interpreted as meaning that the accessories necessary to complete any required system or item of equipment are to be omitted.
5. The use of words in the singular shall not be considered as limiting where other indications denote that more than one item is referred to.

6. Furnish and install all materials for complete and functioning systems, resulting upon completion, in functioning systems in compliance with the performance requirements specified. The omission of express reference to any parts necessary for, or reasonably incidental to a complete installation shall not be construed as a release from furnishing such parts. This reference shall apply to all systems and sub-systems specified herein or otherwise included in these contract documents.
7. Drawings are diagrammatic and indicate general arrangement of system and equipment, except when specifically dimensioned or detailed. They are to show size, capacity, approximate location, direction and general relationship of one work phase to another, but not exact detail or arrangement.
8. Refer to dimensioned architectural/structural drawings for exact, locations of building elements.
9. Field verification of measurements take priority over dimensioned drawings.
10. Dimensions indicated anywhere, are limiting dimensions.
11. The Owner reserves the right to make any reasonable change in location of devices and equipment prior to rough installation without involving additional expense. All changes from the drawings as are necessary to make the work of the Security Electronics Contractor conform to the building as constructed shall be included and installed without extra cost.

1.2 SCOPE AND RESPONSIBILITY

A. Provide full time on site field representation for Division 28 Security Control Systems series scope for work for the duration of installation and prior to turn over. This requirement shall commence upon the start of the installation of field wiring and device installation.

B. Include detailed scheduling information for Security Electronics systems installation and testing in the construction schedule. Provide detailed Gantt chart construction schedule showing all tasks referenced in the project phasing plans. Include:

1. Engineering
2. Shop Drawing Preparation
3. Software Programming
4. Shop Fabrication
5. Equipment Installation
6. Electrical Work
7. Testing, Commissioning, and training.
8. This schedule must be submitted fourteen (14) calendar days after receipt of contract. The duration of this schedule must also comply with the completion dates of the construction schedule contained in the contract documents.
9. Provide coordination to ensure that rooms housing security electronics head end electronics are completed, clean and have conditioned air as early as possible to facilitate completion of control wiring and terminations. **Space shall be free of air-borne particles prior to installation of any Security Electronics Equipment. The Architect Engineer shall inspect and approve the condition of these rooms prior to the installation of any active equipment.**
10. Work with the General Contractor to schedule/conduct periodic coordination meetings between Trade Contractors to make everyone aware of critical areas of construction. Distribute the meeting minutes and attendance to the Owner Representative, the Architect Engineer, General Contractor and the Owner in a timely fashion.
11. Security Electronics Contractor shall provide coordination of mechanical and electrical installation requirements with the General Contractor - and the Electrical Contractor.
12. Provide coordination of the Security Electronics System installation.

13. Provide coordination as required to complete the inspection described in paragraph 3.1 INSPECTION.
14. When on-site inspect conduit raceway system including back boxes, junction boxes, and mortar boxes for all Security Systems, and other furnished work provided by other sections. Notify the Architect Engineer of any discrepancies immediately.
    a. Furnish and install all equipment racks and cabinets.
    b. Furnish and install all required surge protection field devices.
    c. Provide all required circuit protection internal to the head end equipment racks.
    d. All security electronics systems cabling shall be installed in conduit from the field device to the secured equipment rooms.
    e. Furnish and install all devices, equipment, and appurtenances resulting in complete, functional, and fully operational systems as specified herein, indicated on the drawings and listed below:

        1) Section 28 05 10 – Maintenance, Service, and Warranty for Electronic Security
        2) Section 28 05 11 – Backbone System Cabling for Electronic Security
        3) Section 28 05 12 – Horizontal Cabling for Electronic Security
        4) Section 28 05 13 – Conductors and Cables for Electronic Security
        5) Section 28 05 26 – Grounding and Bonding for Electronic Security
        6) Section 28 11 16 – Cabinets and Enclosures for Electronic Security
        7) Section 28 13 00 – Access Control System
        8) Section 28 23 13 – Video Surveillance System
        9) Section 28 46 19 – PLC Hardware for Electronic Security
        10) Section 28 46 20 – PLC Software for Electronic Security
        11) Section 28 50 00 – Miscellaneous Systems
        12) Section 28 51 23 – Integrated Intercom/Paging System for Electronic Security

    f. Furnish and install the Security equipment.
    g. Coordinate with division 26 all requirements of the security electronics signal cable plant including video surveillance, PLC/GUI, intercom/paging, and miscellaneous systems per NEC, as shown in the project documents.
    h. Coordinate with Division 11 for all electro-mechanical lock requirements, tamper proof fasteners and other areas where the two trades integrate with each other.
    i. Furnish and install all miscellaneous systems equipment and materials as required for a complete and fully functional security system as specified and/or indicated on the drawings.
    j. Prior to fabrication, coordinate exact location and installation of security electronic devices.
    k. Provide coordination to complete the inspection described in Paragraph 3.1 INSPECTION.
    l. Provide complete system test, operational certification and Owner training as called for in the contract documents.
    m. Provide complete factory certified training to the Owner.
    n. Coordinate the work of this Section with the General Contractor and that of other Sections to ensure that the entire work of this Project will be carried out in an orderly, complete and coordinate fashion.

1.3 RELATED DOCUMENTS

A. General

1. Drawings, specifications and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification sections, apply to work of this

section. The Security Electronics Contractor and all subcontractors are responsible for locating information pertaining to required items of work specified or indicated elsewhere in the Contract Documents.

B. Related Work Specified Elsewhere

1. Division 00 - BIDDING REQUIREMENTS
2. Division 01 - GENERAL REQUIREMENTS
3. Division 08 - DOORS AND WINDOWS
4. Division 11 - DETENTION EQUIPMENT
5. Division 26 - ELECTRICAL

C. Reference Specifications, Materials, and/or Codes

1. Submit all items necessary to obtain all required permits to the appropriate Regulatory Agencies, obtain all required permits and pay all required fees.
2. All work shall conform to the National Electrical Code (NEC) and to applicable National Fire Protection Association (NFPA) codes.
3. All work shall conform to all Federal, State and local ordinances.
4. Where applicable, all fixtures, equipment and materials shall be as approved or listed by the following:

    a. Factory Mutual Laboratories (FM).
    b. Underwriters Laboratories, Inc. (UL).
    c. National Electrical Manufacturers Association (NEMA).

5. References to the National Electrical Code and National Fire Protection Association (NFPA) are a minimum installation requirement standard. Design drawings and specification sections shall govern in those instances where requirements are greater than those specified in the NEC and NFPA.
6. All material and equipment shall be listed, labeled or certified by Underwriters' Laboratories, Inc. where such standards have been established. Equipment and material which are not covered by UL Standard will be accepted provided equipment and material are listed, labeled, certified or otherwise determined to meet safety requirements of a nationally recognized testing laboratory. Equipment of a class, which no nationally recognized testing laboratory accepts, certifies, lists, labels, or determines to be safe will be considered, if inspected or tested in accordance with national industrial standards such as NEMA, ICEA or ANSI. Evidence of compliance shall include certified test reports and definitive shop drawings. NOTE: It is not required that the final installed system be UL listed as a single product.
7. All work shall meet or exceed the standards and procedures of the following:

    a. National Fire Protection Association (NFPA): NFPA 70, NFPA 72, NFPA 90A
    b. National Electrical Code (NEC)
    c. American National Standards Institute (ANSI)
    d. National Electrical Manufacturers Association (NEMA)
    e. American Society of Testing Materials (ASTM)
    f. Institute of Electronic & Electrical Engineers (IEEE)
    g. Underwriters Laboratory (UL)
    h. Americans With Disabilities Act (ADA)

8. Include all items of labor and material required to comply with such standards and codes. Where quantity, sizes or other requirements indicated on the drawings or herein specified are in excess of the standard or code requirements, the specifications or drawings, respectively, shall govern.

1.4 QUALITY ASSURANCE

A. General

1. Furnish and install only new equipment and materials required (less than 1 year from manufacture), unused without blemish or defect.
2. Each major component of equipment shall have the manufacturer's name, address, model number and rating on a plate securely affixed in a conspicuous place. The nameplate of a distributing agent is not permitted. NEMA Code Ratings, UL label, or other data which is die-stamped into the surface of the equipment shall be stamped in a location easily visible. Performance as delineated in schedules and in the specifications shall be interpreted as minimum performance. In many cases, equipment is oversized to allow for pickup loads which cannot be delineated under the minimum performance.
3. All equipment of the same type shall be the product of one manufacturer.
4. The original factory condition of manufactured equipment shall not be modified without the written approval of the Architect Engineer.
5. If it is determined that the Security Electronics Contractor has not complied completely with the specified turnover of the “NON-PROPIETARY” code for the Owner as well as provided all “NON-PROPRIETARY” equipment, the Security Electronics Contractor bonds will be called and all costs associated with this non-performance will be borne solely by the Security Electronics Contractor.
6. Provide only non-proprietary software. Proprietary software is not permitted. For software and software vendors to be considered non-proprietary they must have a minimum of five system manufacturers proficient in the programming, integration and maintenance of the manufactured software. All software logic shall be developed in the Wonderware or Omron InduSoft environment and not developed in third party software or provided in a compiled DLL, EXE file format or other encrypted file format/extension. Any software approach that is found to be provided with proprietary approach shall be removed and the Security Electronics Contractors bond shall be “called”. All costs to remove and rewrite the software shall be the Security Electronics Contractors responsibility.

B. The Security Electronics Contractor shall participate in a MANDATORY PRE-SUBMITTAL MEETING.

1. Location: Project Job Site
2. Time Line: Sixty (60) days after award of contract
3. Participants:

    a. Architect / Engineer
    b. General Contractor
    c. Electrical Contractor
    d. Security Electronics Contractor

        1) Project Manager
        2) Project Estimator

4. The initial assembly of submittal materials as described herein shall be submitted for review.

C. Bill of Materials

1. Provide complete bill of materials for all major components, accessories, and hardware to be provided in order to assemble a complete functioning system.
2. Bill of Materials shall include-

a. Manufacturer Name
b. Model
c. Version
d. Quantity

D. Unless stated differently in the Bidding General Provisions, provide six (6) copies of submittals as called for below.

E. The formal submittal shall be transmitted 30 days after Pre-Submittal Meeting.

F. Product Submittal

1. Submittal must consist of a complete package, bound in a three ring binder, including, Product Data for each Section of the Division 28 Security Systems series specifications, and Shop Drawings as applicable. PARTIAL OR INCOMPLETE SUBMITTALS ARE NOT ACCEPTABLE. The Submittal shall include the following:
2. A Title Page complete with the following required information:

   a. Project name.
   b. Date.
   c. Name and address of the Architect / Engineer.
   d. Name and address of the General Contractor -
   e. Name and address of the Electrical Contractor
   f. Name and address of any Subcontractors.

3. An Index Page complete with the following required information:

   a. Name of the Supplier.
   b. Name of the Manufacturer.
   c. Title, section and paragraph of the Specification Sections. (Example section 281116, paragraph 2.4)
   d. Products in order as specified in PART 2 of the related specification.

4. Each Specification section shall be separated, collated in order, and complete with the following information:

   a. Title sheet.
   b. Descriptive purpose of the system, stating how each product is to function.

5. Each Data Sheet shall have the specific reference to the Specification it is to be used for, noting the section and paragraph.
6. Product Data showing multiple products, models, or options shall be clearly marked identifying the specific product, model, and options which are submitted for review. Unmarked submittals or facsimile copies shall not be acceptable.
7. Submit product data for all equipment showing:

   a. Original Data Sheets Only. Fax copies are not acceptable.
   b. Product performance, mechanical and electrical specifications.
   c. Manufacturer's installation instructions.
   d. Certification from the submitted manufacturers that the Security Electronics Contractor's designated personnel are trained on the installation of the system. Include installer's name, experience and responsibility.
   e. Product test compliance certificates if required.

G. Shop Drawings

1. Submittals consisting of reproduced copies of the original bidding documents will be rejected. The Security Electronics Contractor is required to develop a complete set of drawings specific to the final configuration of the system based on the manufacture and models of all components included. Shop drawings are to include all changes noted in addenda, as well as any changes included in architects special instructions or change orders issued prior to the submittal of the shop drawings.
2. Shop drawings shall be submitted with product data.
3. Electronics files of floor plans and reflected ceiling plans are available from the ARCHITECT/ENGINEER (see spec 013300, 1.4). Detail sheets, block diagrams, and riser sheets are not available.
4. All drawings shall be created using an industry recognized computer aided design program. Recognized programs include AutoDesk Revit, and Auto Cad. All drawings are to be made using the latest software release available.
5. Submit shop drawings for all equipment showing:

    a. Location and layout of all field equipment on floor plans.
    b. Large scale (minimum ¼"=1') floor plan and elevation view drawings of all security electronics rooms and control rooms depicting all racks, consoles, cabinets, equipment, outlets, etc.
    c. Size and spacing of all anchors, wall penetrations, joinery construction, etc., required for complete system installation.
    d. Sizes, shapes, thickness and finishes of all materials and equipment surfaces.
    e. Electrical riser diagrams identifying all signal, power and ground circuitry.
    f. Block diagram(s) depicting system integration details.
    g. Scaled elevations of all security equipment racks showing equipment mounting locations (front and rear if any equipment is rear-mounted).
    h. Wall elevations showing mounting of cabinets and enclosures, conduit routing, etc.
    i. Wire management details for the installation of cable harnesses inside racks, equipment cabinets, consoles, control panels and other areas of exposed cable.
    j. Wiring diagrams for all equipment and devices (active and passive).

        1) Wiring diagrams are required to show point-to-point connection of all terminations for all devices.
        2) Indicate wire type used for connection.
        3) Indicated type of termination to be made. (i.e. terminal strip, euro block, XLR, etc.)
        4) Indicate wire tag number.

    k. Scaled layout of all custom integrated control system graphic user interface panels.
    l. Installation detail of all surface or flush mounted devices including but not limited to speakers, cameras, readers, etc. Detail to show all required mounting and suspension hardware, as well as connection made to structure. Provide front, side, and top views.
    m. Installation detail of all suspended devices including but not limited to speaker systems, projection systems, etc. Detail to show all required mounting and suspension hardware, as well as connection made to structure. Provide front, side, and top views.
    n. Functional and operational written reports of all security systems.

H. Samples

1. Provide samples as requested for review and approval of substitutions or as specified in Division 28 Security Systems specification.
2. Submit for each type of tamper-proof fastener. Indicate materials, finish, head design, strength, corrosion resistance, and installation/removal methods.
3. Submit four (4) samples of each type of tamper proof fastener proposed for use

I. Test Plan and Documentation

1. Submit a complete testing plan for all systems for approval with the shop Drawing/Product Data submittal.
2. Plan submitted must include shop and field-testing of each and every field device and control function.
3. Plan submitted must include examples of testing documentation. Shop testing documentation must be submitted for approval prior to control system shipment to job site. Field-testing documentation must be submitted when requesting final Demonstration/Inspection (described below).
4. Detailed testing agenda and testing documentation forms for all systems. Detailed agenda outlining the "hands-on" training sessions to be provided to the User. The operation, programming/debugging, troubleshooting, repair and maintenance of all systems shall be covered.

J. Training Plan and Documentation

1. Submit a complete training plan for all systems for approval.
2. As a minimum, the plan submitted must include individualized training paths for the following personnel on all aspects of the Security Electronics system.

    a. Administrators
    b. Supervisors
    c. Operators
    d. Maintenance Personnel

3. As a minimum, the plan submitted must include the following:

    a. Proposed classes or sessions.
    b. Recommended attendees for each class or session.
    c. Proposed class or session objectives.
    d. Proposed class or session agenda and duration.
    e. Proposed supporting materials for each class or session.
    f. Proposed testing procedure for evaluation purposes.
    g. Proposed documentation of testing and evaluation.

4. Do not commence training until the Architect Engineer has approved the plan.
5. Plan submittal must include names of technical instructors. Security Electronics Contractor must provide technician responsible for project as instructor. Security Electronics Contractor instructor shall submit evidence of factory training on system provided.
6. Co-ordinate with spec 017900.

K. Operating and Maintenance Data

1. Provide a bound and illustrated control console operator’s manual. One copy shall be provided for each control station.
2. The operator’s manual shall be written in laymen’s language and printed so as to become a permanent reference document for the operators, describing all control panel icon

operations, graphic symbol definitions, and all indicating functions and a complete explanation of all software.

3. Provide a bound and illustrated service manual. Three copies of the manual shall be provided.
4. The service manual shall be written in laymen's language and printed so as to become a permanent reference document for maintenance personnel, describing how to run internal self-diagnostic software programs, troubleshoot head-end hardware and field devices with a complete scenario simulation of all possible system malfunctions and the appropriate corrective measures.
5. Provide three (3) copies of each Operating and Maintenance manual for each Division 28 Security Systems, and six (6) copies in electronic form – Disc. Manuals shall be bound in "D-ring" binders with a detailed table of contents.
6. The O & M manuals shall be cross-referenced to the Record Documents and contain the following information for all systems:

    a. Product catalog cut sheets and specifications of all equipment.
    b. "Hands-on" operational description of all equipment and performance features in each system using clear and understandable terminology.
    c. Detailed programming instructions for all systems and all software programs.
    d. Printed copy of all equipment settings.
    e. Copy of all software programs required. Copy shall include most recent version of manufacturer's software, and all final programming settings. Software shall be stored on CD/DVD and USB thumb drive. Provide one CD/DVD copy for each O&M Manual, and one USB thumb drive that is to be left in the rear of the equipment rack.
    f. Troubleshooting procedures to diagnose malfunctions in each system.
    g. Repair procedures for all equipment.
    h. Preventative maintenance procedures for all equipment.
    i. Table listing the model numbers for all equipment in each system including the names and phone numbers of the manufacturer and their representative directly responsible for this project.

L. Record Documents

1. Submit three (3) black line prints, and six (6) electronic copies (disc form) of the "As-built" condition of all systems including:

    a. A set of updated shop drawings showing all Contract changes.
    b. A set of updated product data showing all Contract changes.
    c. "Hands-on" operational description of all equipment and performance features in each system using clear and understandable terminology.
    d. Floor plan showing conduit raceway routing including all equipment rack, cabinet and pull box locations, and conduit sizes.
    e. Complete point-to-point wiring diagrams showing ALL equipment, devices, wire and cable (Signal, power and ground). This document shall also include all terminal block designations, abbreviations and color-coding.
    f. Provide report showing results of all tests required and outlined in individual Div 28 series specifications.
    g. Three (3) copies of approved training session DVD.
    h. Transmittal letter listing delivery and acceptance of complete spare parts inventory.
    i. Copy of warranty statement
    j. Procedures for addressing warranty/repair issues.
    k. Co-ordinate with 017839.

1.5 ADDITIONAL CONSTRUCTION ADMINISTRATION SERVICES BY THE ARCHITECT ENGINEER

A. The Trade Contractor (TC) shall be obligated to reimburse the Owner/User for reasonable costs for the following additional professional services for which the Owner will be required to compensate the Architect Engineer. Reimbursement shall be on an hourly basis at the Architect Engineers standard rates, plus reasonable reimbursable expenses billed at a rate of 1.1 times the actual cost to the Architect Engineer. A deductive change order to the Security Electronics Contract sum will be processed periodically for the cost of such services incurred by the Owner.

1. More than two reviews of the same submittal.
2. Responding to multiple “Requests for Information” (RFI) for which the answer is readily obtainable in the Contract Documents.
3. Preparation and follow up review of more than one “Punch List” for the same items of work.
4. Construction administration services that extend more than 60 days past the initial date of Substantial Completion. These services include, but are not limited to, all work associated with the following: attending pay/progress meetings, on-site observation, and processing the Application and Certification for Payment.

    a. The Architect Engineer will endeavor to notify the Owner and the Security Electronics Contractor prior to performing any work that will result in the aforementioned additional services; and to review any proposed modifications to the contract. Contract modification shall not be contingent, however, upon issuance of any such notice or prior review.

PART 2 PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Refer to Section 016000 – Product Requirements

B. All products shall be new (less than one year from manufacture and unused and without blemish or defect).

2.2 SUBSTITUTIONS

A. Submit substitutions in accordance with Section 016000 – Product Requirements. No other method of substitution is acceptable.

B. Deviations from specifications

1. Any deviations from the specifications must be approved 10 calendar days prior to the bid date. This includes changes to the scope of work, equipment substitutions, and changes to the general provision.
2. Changes to the scope of work in the bid proposal are not acceptable. Any proposed change is to be submitted to the Architect Engineer for review. Any approved changes will be listed by addendum prior to the bid opening.
3. Any proposed equipment substitution must be submitted 10 calendar days prior to the bid date. Accompany the request, the contractor must provide manufactures product

specifications for the exact model be substituted. This literature must clearly state all specifications called for in the bidding documents, as well as performance characteristics not specified but inherent to the product listed in the specifications. Any items approved for substitution will be listed by addendum prior to the bid opening. Substitutions after the award of bid will only be allowed in case of discontinued equipment, or if an item of equal or better quality is available and will not affect the contract cost of the system.

4. Changes to the general provisions are not acceptable. Any proposed change is to be submitted to the Architect Engineer for review. Any approved changes will be only listed by addendum prior to the bid opening.
5. When a specified item is found to be discontinued or obsolete by the manufacturer, the Security Electronics Contractor is required to substitute the manufacturer recommended equivalent for that product. If an equivalent is not available, the contractor is instructed to notify the Architect in writing prior to bid time.
6. Where specific products are sole source specified, no substitutions will be allowed.

2.3 MANUFACTURED PRODUCTS

A. Materials and equipment furnished shall be of current production by manufacturers regularly engaged in the manufacture of such items, for which replacement parts are available.

B. Equipment Assemblies and Components

1. All components of an assembled unit need not be products of the same manufacturer; however, all components must be acceptable to the Architect Engineer.
2. Manufacturers of equipment assemblies, which include components made by others, shall assume complete responsibility for the final assembled unit.
3. When more than one unit of the same class of equipment or material is required, such units shall be the products of a single manufacturer.
4. Components shall be compatible with each other and with the total assembly for the intended service.
5. Constituent parts which are similar shall be the product of a single manufacturer.
6. Moving parts of any element of equipment of the unit normally requiring lubrication shall have means provided for such lubrication, and shall be adequately lubricated at the factory prior to delivery.

    a. All factory wiring shall be identified on or provided with the equipment being furnished and on all wiring diagrams and included with O & M manuals.
    b. When factory testing is specified:

7. The Architect Engineer / Owner shall have the option of witnessing factory tests. The Security Electronics Contractor shall notify the General Contractor and the Architect Engineer / Owner a minimum of 15 working days prior to the manufacturer making the factory tests.
8. Four copies of certified test reports containing all test data shall be furnished to the Architect Engineer prior to final inspection and not more than 90 days after completion of tests.
9. When equipment fails to meet factory test and re-inspection is required, the Security Electronics Contractor shall be liable for all additional expenses.

2.4 EQUIPMENT IDENTIFICATION

A. In addition to the requirements of the National Electrical Code, install an identification sign that clearly indicates information required for use and maintenance of items such as cabinets, control devices and other significant equipment.

B. Nameplates shall be laminated black phenolic resin with a white core and engraved lettering, a minimum of 1/4-inch high. Nameplates that are furnished by manufacturer, as a standard catalog item, or where other methods of identification are herein specified, are exceptions.

C. All inputs and outputs are to be clearly labeled. Inputs to include the source location and signal type. Outputs should indicate location signal is sent to.

D. All custom input plates labeling shall be engraved and paint filled or laser etched with a contrasting color as shown on the specification.

E. Any and all user serviceable devices shall be clearly labeled

PART 3 EXECUTION

3.1 INSPECTION

A. Before installing electronic equipment, carefully inspect the installed Work of all other Trades. Verify that all such Work is complete to the point where the installation of electronic equipment may properly commence. Verify that the security electronic closets are free of airborne contaminants prior to the installation of electronic equipment.

B. Verify that all equipment is installed in accordance with all pertinent codes and regulations, the original design, and the referenced standards.

C. In the event of discrepancy, immediately notify the Architect Engineer.

D. Do not proceed with installation in areas of discrepancy until such discrepancies have been fully resolved.

E. Return to original (preconstruction) condition any work disturbed during system installation.

3.2 INSTALLATION

A. Install all equipment in strict accordance with the manufacturer's recommendations, reviewed shop drawings and all applicable codes and standards.

B. Do not attach electrical materials to roof decking, removable or knockout panels, or temporary walls and partitions, unless indicated otherwise.

C. Secure equipment with fasteners suitable for the use, materials and loads encountered. If requested, submit evidence proving suitability.

D. National Electrical Code requirements are applicable to all work.

E. Working spaces shall be not less than specified in the National Electrical Code for all voltages specified.

F. Where the Architect Engineer determines that the Security Electronics Contractor has installed equipment not conveniently accessible for operation and maintenance, equipment shall be removed and reinstalled as directed at no additional cost to the Owner. "Conveniently accessible" is defined as being capable of being reached without the use of ladders, or without climbing or crawling under or over obstacles such as motors, pumps, belt guards, transformers, piping, and duct work.

G. All programming of control panels and recording/storage devices shall be performed in the Security Electronics Contractors shop prior to delivery to the job site. All equipment is to be fully tested.

H. All equipment racks are to be fully assembled and wired in the Security Electronics Contractors shop prior to delivery to the job site. All electronics are to be full tested prior to installation.

3.3 WORK PERFORMANCE

A. Coordinate location of equipment with other trades to minimize interferences.

B. Holes through concrete and masonry in new and existing structures shall be cut with a diamond core drill or concrete saw. Pneumatic hammer, impact electric, hand or manual hammer type drills shall not be allowed, except where permitted by the Architect Engineer as required by limited working space.

C. Holes shall be located so as not to affect structural sections such as ribs or beams.

D. Holes shall be laid out in advance. The Architect Engineer shall be advised prior to drilling through structural sections for determination of proper layout.

E. Any holes created in walls, floors, or ceilings by the Security Electronics Contractor are to be firestopped according to Section – 078413 – Firestopping and all national, state, and local codes.

F. Hangers and other supports shall support only equipment and materials. Provide not less than a safety factory of 5, which shall conform to any specific requirements in the Construction Documents.

G. The Security Electronics Contractor is responsible for repairing and or replacing any damage caused by their workforce at no additional cost to the Owner.

3.4 PROTECTION AND CLEANING OF SYSTEMS AND EQUIPMENT

A. Protect all materials and equipment from damage during storage at the Site and throughout the construction period. Equipment and materials shall be protected during shipment and storage against physical damage, dirt, moisture, cold and rain.

B. Damage from rain, dirt, sun and ground water shall be prevented by storing the equipment on elevated supports and covering them on all sides with securely fastened protective rigid or flexible waterproof coverings.

C. Piping shall be protected by storing it on elevated supports and capping the ends with suitable closure material to prevent dirt accumulation in the piping.

D. All conduits in the slab will be duct taped closed off to avoid water collection, during freezes, snow, rain, and foreign objects entering the conduits.

E. During construction, cap the top of all conduits and raceway installed vertically.

F. During installation, protect equipment against entry of foreign matter on the inside, and vacuum clean both inside and outside before testing and operating.

G. Damaged equipment, as determined by the Architect Engineer, shall be replaced.

H. Painted surfaces shall be protected with removable heavy craft paper, sheet vinyl or equal, installed at the factory and removed prior to final inspection.

I. Repaint damaged “FINISH” paint on equipment and materials with painting equipment and finished with same quality of paint and workmanship as used by the original manufacturer so repaired areas are not obvious.

J. Conduit back boxes, floor boxes, and poke thru’s shall be vacuumed clean prior to the installation of cable.

3.5 IDENTIFICATION

A. Nameplates shall be laminated black phenolic resin with a white core and engraved lettering, a minimum of 1/4-inch high. Nameplates that are furnished by manufacturer, as a standard catalog item, or where other methods of identification are herein specified, are exceptions.

B. Uppercase letters of uniform height; centered on device, cover plate, or enclosure; engraved letters filled with a contrasting color; and all characters made clearly and distinctly.

C. Use abbreviations defined in the contract documents whenever possible. Use plan designations for labeling unless indicated otherwise.

3.6 LABELING

A. All cables shall be properly identified using a high quality thermal transfer-labeling device such as the Kroy K4100 or equal.

B. Cable

1. Provide typewritten labels on both ends of all security electronics system cabling. Locate label within 2” of cable termination. Cover label with clear heat shrink tubing.
2. Label designation to consist of letter indicating type of cable (i.e. V for video, C Control, M for Master Station etc.) and a number. Numerical designations shall be sequential.

    a. Power Outlets

3. Power outlet labels are to be mechanically generated.
4. All power outlets designated for security equipment shall be labeled “SECURITY ELECTRONICS EQUIPMENT ONLY”. On top.
5. Provide a second label on the bottom of the outlet cover plate indicating service panel number and circuit breaker number.
6. Text lettering to be 1/8” high.

C. Rack Mounted Electronic Components

1. Electronic component labels are to be mechanically generated.
2. All inputs are to be labeled identifying source location of signal.
3. All outputs are to be labeled identifying signal destination.
4. Provide ¼" diameter indicator dot showing level setting for all rotary knobs, sliders, and pushbutton switches.
5. Power switches shall be clearly labeled indicating switch is to be left in the on position at all times.

3.7 CABLE TERMINATIONS AND DRESS

A. Installation of signal, video, communication, and control conductors shall adhere to the following:

1. Cables shall be installed in Panduit wire duct (or approved equal) in all cabinets, racks and/or at control panels and consoles for all wire and cable management.
2. Cables shall be secured to equipment cabinet backboards, console members or to other system components using Panduit wire duct (or approved equal). Security Electronics Contractor shall furnish and install cable support posts, cable clamps or wraps, if required, to facilitate system installation where plastic wire duct use is not possible.
3. All cables and/or conductors shall be terminated with approved cable termination connectors compatible with the specific termination.
4. Label all cables on both ends and on all termination points. Refer to section 3.6.B.1.

3.8 CLEANING

A. Refer to Section 017419 – Construction Waste Management and Disposal

B. Daily during construction and prior to User acceptance of the building, remove from the premises and dispose of all packing material and debris caused by work performed under Division 28 Security Systems.

C. Remove all dust and debris from interiors and exteriors of electrical equipment and related junction boxes, floor boxes, and other associated devices. Clean accessible current carrying elements prior to being energized.

D. Upon completion of the work, remove excess debris, materials, equipment, apparatus, tools and the like and leave the premises clean, neat and orderly.

E. All bright metal or plated work shall be thoroughly polished. All pasted labels, dirt and stains shall be removed from the devices.

3.9 COMPLETION

A. Results Expected

1. All equipment and materials shall be in place, all controls shall be set and calibrated, all programming shall be installed and debugged, and all systems shall be demonstrated to be operationally complete.
2. All testing, start-up and cleaning work shall be complete.

3. All documented testing results are submitted and approved by the Architect Engineer. The security electronics contractor at no additional cost shall replace any component of the system that fails to meet the performance as specified.
4. All O & M Manuals and Record Documents are reviewed and accepted.
5. Substantial Completion inspection is performed and granted. The Substantial Completion inspection punch list is completed by the Security Electronics Contractor.
6. All facility training shall be complete and the DVD of the training session is accepted.
7. All warranties are received.
8. Transmittal letter listing delivery and receipt of complete spare parts inventory.
9. Special test equipment is received.

3.10 DEMONSTRATION/INSPECTION

A. Upon completion of approved testing procedure and submittal of testing documentation as described above, the Security Electronics Contractor shall notify the Architect Engineer, who will visit the project for a demonstration of the systems and an inspection of the completed work in conformance with the Construction Documents. It is mandatory for a representative from the Security Electronics Contractor and the Owner directly responsible for the project to be present during demonstration and inspection periods.

B. Items which do not comply with the Contract Documents, or which function incorrectly, will be listed and the list will be submitted by the Architect to the Contractor.

C. After all corrections have been made, the Security Electronics Contractor shall notify the Architect Engineer who will recheck the system for compliance of all items listed. **IF THE ARCHITECT ENGINEER OR OWNER IS REQUIRED TO AGAIN RETURN TO THE SITE FOR FURTHER INSPECTIONS, THE SECURITY ELECTRONICS CONTRACTOR SHALL REIMBURSE ALL LABOR AND TRAVEL EXPENSES**.

3.11 TRAINING

A. Provide training after all final tests and adjustments have been completed. Instruct the User's personnel according to the approved Training Plan specified above in "Training Plan and Documentation." Training shall cover all aspects of systems operation, maintenance and programming, and shall be provided by the responsible Security Electronics Contractor technical representatives.

B. Provide written operating instructions specific to the basic operation of the system. Basic instructions should cover all operational aspects of the system required for basic operation including system powering, signal patching and routing, and level control. These instructions are to be laminated and located with the main system power control.

C. Schedule training sessions to meet the needs of facility personnel as determined by the Owner. Provide training during second and third shifts.

D. Record all training sessions. Submit an edited DVD copy to the Architect Engineer for review and approval. Present all materials used in the training session on the video. Any DVD found to be inferior in recording or material content shall be reproduced at no cost until an acceptable tape is submitted.

E. Provide a minimum of 32 hours of training. All training is to be completed during the time frame established during scheduling with the Owner. Training may not necessarily be in continuous periods.

F. Refer to individual sections for system specific training requirements.

G. Shake Down Period:

1. The SEC shall provide 3 days of system shakedown, which shall include providing a fully trained employee of the SEC who shall provide additional training, system repairs and alterations prior to, during and after the transfer of inmates into the facility. The system shall be fully operational and certified prior to the shakedown period beginning.
2. This person shall be on-site during the 1st shift and be available or on-call during 2nd and 3rd shift.

3.12 MAINTENANCE MATERIALS

A. All special tools for proper operation and maintenance of the equipment provided under this Specification shall be delivered in conformance with Section 017700 Closeout Procedures.

B. Provide spare materials as indicated in Contract Documents and as required for proper maintenance of the Security Systems.

3.13 WARRANTY, WARRANTY SERVICE AND MAINTENANCE

A. Refer to Section 280510 – Maintenance Service and Warranty for Electronic Security

END OF SECTION 28 05 00

SECTION 280510 - MAINTENANCE, SERVICE, AND WARRANTY FOR ELECTRONIC SECURITY

PART 1 GENERAL

1.1 SYSTEM DESCRIPTION

A. Furnish and install all equipment, materials and labor necessary to complete the installation of specific systems described herein and integration of all systems as indicated, specified herein or both. The work includes the following, as well as work not listed below but described elsewhere:

1. Scheduled Maintenance
2. Non-Scheduled Maintenance
3. Documentation of Maintenance
4. Spare Parts Inventory
5. Future Staff Training
6. Third Party Service Contracts

B. It is the intent of this Section to define maintenance services to support all systems included in the 280500 series specifications (excluding conduit and boxes furnished by others but including final connections).

C. The Security Electronics Contractor shall provide maintenance and service as part of the Contract during the two-year guarantee period. The guarantee period shall begin with Owner acceptance of the systems as “complete as specified” not at Substantial completion.

D. Six months prior to the end of the two year guarantee period, the Security Electronics Contractor shall provide a proposal for a three (3) year continued maintenance contract for the complete Security Electronics System. If accepted, the maintenance contract shall take effect at the completion of the initial two (2) year guarantee period.

1.2 PRODUCTS

A. All products used in parts replacement shall meet the specifications for the original equipment. The Architect Engineer must approve any substitutions.

1.3 SPARE PARTS

A. Two GUI including touch screen monitor, CPU, Keyboard and mouse.

B. One case of paper and four replacement cartridges for printer specified.

C. 10 spares of each type of relay used on this project.

D. Two Surveillance camera of each type used

E. 25 fuses of each type used

F. One spare PLC CPU

G. One spare PLC Module of each type used

H. Two spare PLC power supply

I. One spare linier power supply of each type used

J. One spare surveillance desktop monitor

K. One spare intercom master station

L. One spare intercom call station of each type used

M. One spare card reader

1.4 SOFTWARE SERVICE

A. Update software to latest version at project completion.

1. Install and program software upgrades that become available within one year from date of substantial completion.
2. Upgrading software shall include the operating system.
3. Upgrade shall include new or revised licenses for use of software.
4. All upgrades shall include spares.

B. Provide (30) days notice to Owner to allow scheduling and access to system and to allow Owner to upgrade computer equipment if necessary.

PART 2 EXECUTION

2.1 WARRANTY AND WARRANTY SERVICE

A. Warranty

1. The Division 28 series security systems shall be fully guaranteed for a period of two (2) years beginning on the date of Owner acceptance.
2. The guarantee shall include the entire Division 28 series scope of work including all equipment, devices, materials, cable/wire, software and installation as it applies to security electronics.
3. Work shall be guaranteed to be free from defects. Any defective materials or workmanship, as well as damage to the Work of all other Security Electronics resulting from same, shall be replaced or repaired as directed by the Owner for a period of two (2) years from the date of Owner final acceptance. The Security Electronics Contractor shall provide written warranties for all systems and all buildings to the Owner.
4. The guarantee shall exclude acts of God, vandalism, physical abuse or operator misuse.

5. Acceptance by a manufacturer of an order for equipment for this contract signifies acceptance of this warranty. During the warranty period there shall be no charge to the Owner for equipment, material, software, etc. for guarantee work.
6. During the warranty period, there shall be no charges to the Owner for service calls (mileage, labor, travel, expenses, etc.) for warranty work.

B. Warranty Service

1. The Security Electronics Contractor shall provide warranty service as part of this Contract during the warranty period.
2. Warranty service agreement must be submitted separately and must contain the name, voice phone number, facsimile phone number and pager number of the service provider capable of meeting the response times as defined by the Architect Engineer.

3. This service shall consist of the following:

    a. 24-hour staffed phone number.
    b. Technician's factory trained by the manufacturers of the system's components.
    c. Authorized representation of the manufacturer via an agreement of factory support.
    d. Five years experience (minimum) servicing systems of the type included in this project.
    e. Capability of making additions or changes to the software systems used in this project.
    f. Capability of servicing the individual system components and the <u>total</u> security electronics system.
    g. Equipment and knowledge to test all specified equipment and devices.
    h. Current system documentation including but not limited to the following:

        1) Wiring diagrams.
        2) Operation and maintenance manuals.
        3) Software programs.
        4) Other documentation as required to provide assistance to the Owner in the operation and maintenance of the systems.
        5) All documents shall be made available to Owner upon request.
        6) Upon termination of maintenance agreement all system documents shall be furnished to Owner for maintenance continuity.

4. The Owner and/or Architect Engineer shall notify the Security Electronics Contractor in writing, outlining operational malfunctions or defects in the Division 28 series Security Electronics system. This report shall be emailed or faxed to the service provider, which will establish the date and time or problem notification.
5. Upon successful completion of warranty service, the responsible technician shall return a copy of the original service request to the facility with a detailed description of the problem found, and corrective action taken including a list of equipment/parts/software repaired or replaced. The technician shall also sign the on-site service log at the facility.
6. The Security Electronics Contractor shall maintain a repair parts inventory sufficient to maintain the response times specified. All parts used from the Owner's spare parts inventory for warranty service shall be replaced at no cost to the Owner.

2.2 OWNER INSPECTIONS

A. Inspections by the Owner shall consist of "go, no-go" type inspections to determine the operational state of a system. It is not intended that the Owner perform adjustments or modifications for system restoration.

B. The Owner as a result of daily inspections and/or operational use of the systems will initiate non-scheduled maintenance. Categories of maintenance support and the response time for system restoration are defined in NON-SCHEDULED MAINTENANCE below.

2.3 SCHEDULED MAINTENANCE

A. The Security Electronics Contractor shall provide scheduled maintenance as described below.

B. Quarterly Scheduled Maintenance

1. Security Control System

   a. Touch Screens and CPUs (inspect and clean).
   b. Programmable logic controllers.
   c. Test all duress/panic pushbuttons.
   d. Relay cabinets.
   e. Electro-mechanical detention hardware (Note: The Division 11 Detention Equipment Contractor shall perform all maintenance and adjustment of these devices. The Security Electronics Contractor shall verify proper security control system operations only).
   f. Inspect and clean all system filters.
   g. Auxiliary devices such as indication lights, push buttons, door position switches.

2. Video Surveillance System

   a. Verify proper video image at each VMS work station.
   b. Check image quality of each camera.

3. Intercom, Paging and Communication Systems

   a. Verify proper operation of master stations.
   b. Verify proper adjustment of all remote intercom amps.
   c. Verify proper adjustment and operation of all paging amplifiers.

4. Access Control System

   a. Verify proper operation of card readers
   b. Verify proper operation of request-to-exit devices

5. Uninterruptible Power Systems (UPS)

   a. Verify proper voltage and current levels
   b. Exercise UPS function by system power blackout and emergency generator test.

6. Grounding and Surge Protection

   a. Check status of all devices.

b. Perform ground measurements.

2.4 NON-SCHEDULED MAINTENANCE

A. The Security Electronics Contractor shall provide non-scheduled or "on-call" maintenance services in accordance with the following Service Response Categories.

1. Critical: Items which compromise the security of the facility or have an adverse effect on the operations of the facility. Items in this category shall be returned to service within 4 actual hours after receipt of a service call by the Security Electronics Contractor. Service shall be available on a 7-day, 24-hour basis.
2. Sensitive: Items which adversely impact the operations of the facility but are not considered "critical" as defined above. Items in this category shall be returned to service within 24 actual hours after receipt of a service call by the Security Electronics Contractor.
3. Normal: Items which require maintenance support but are not "critical" or "sensitive" as defined above. These are typically items which staff personnel identify and accept that maintenance shall be performed by Security Electronics Contractor during the standard quarterly inspection.
4. The Security Electronics Contractor shall coordinate Remote Access of the Security System for Maintenance, trouble shooting, and any other questions or issues with the owner. Remote access to the Security Network will be partitioned to control the access to the individual systems, I.E. PLC/GUI, Video Surveillance, Access Control, Intercom Paging. Contractor to coordinate access requirements with the owners IT Department.

B. System/Response Category Table

PRODUCT DATA SHEET 1 - SYSTEM		CATEGORY
1. Touch Screen/PLC/Security Control		
a.	All components	Critical
b.	Duress/Panic Pushbutton	Sensitive
2. Video Surveillance System		
a.	VMS Server	Critical
b.	Storage array or component	Critical
c.	Surveillance Camera	Sensitive
d.	VMS Work Station Display	Sensitive
e.	VMS Work Station CPU	Sensitive
3. Intercom System		
a.	Master Station	Critical
b.	Single remote station	Sensitive
c.	Paging	Critical
4. Uninterruptible Power Systems (UPS)		
a.	All components	Critical
5. Surge Suppression		

a. All components Sensitive

2.5 DOCUMENTATION OF MAINTENANCE

A. It shall be the responsibility of the Security Electronics Contractor to maintain all documents and modify drawings, schedules, and other documents as required to effect documentation which reflects the current system or wiring configuration.

B. Create and maintain a maintenance log that details maintenance services provided, system modifications, and software upgrades. One copy of log is to remain at the facility.

C. Upon termination of the service contract, the Security Electronics Contractor shall return all system documents to the Owner.

2.6 SPARE PARTS INVENTORY

A. An inventory of spare parts consisting of at least the quantity of items herein must be provided and maintained by the Security Electronics Contractor to support the maintenance response requirements defined in this document.

B. The spare parts inventory may be comprised of Security Electronics Contractor furnished and/or maintained parts.

C. The Security Electronics Contractor shall maintain a spare parts inventory in excess of the amount indicated in Contract Documents, as he deems necessary to support the maintenance and service requirements of this section.

D. During the maintenance and service period, the Contractor shall maintain a log of all component failures and parts replaced.

E. Six months prior to the expiration of the maintenance and service period, the Security Electronics Contractor shall submit the replaced parts log to the Owner. The Owner shall use the replace parts log to evaluate the on-site spare parts inventory required for future maintenance by the Owner/User.

2.7 FUTURE STAFF TRAINING

A. It shall be the responsibility of the Security Electronics Contractor to train the Owner on new system features or software which may be provided to enhance the system's capability.

2.8 THIRD PARTY SERVICE CONTRACTS

A. The Security Electronics Contractor shall provide a third-party service contract for all equipment supplied that is more efficiently serviced by the third-party company.

B. The service contract shall provide service response times as described above.

C. All third-party service requests shall be acknowledged through the Security Electronics Contractor to verify appropriate service procedures have been followed as outlined in the service manual.

END OF SECTION 28 05 10

SECTION 280511 - BACKBONE SYSTEM CABLING FOR ELECTRONIC SECURITY

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary conditions and Division 1 Specifications Sections, apply to this Section.

1.2 SYSTEM DESCRIPTION

A. General

1. Provide a complete Fiber Optic Backbone Cabling system that supports video voice and data as indicated in Project Documents relative to the implementation of the security electronics system(s).
2. Backbone shall consist of multi-mode fiber.
3. Provide Fiber Optic Backbone system cabling, rack mounted fiber optic termination enclosures, patch cables, terminations and testing for the Fiber Optic Backbone Cabling system as indicated in Project Documents.

B. Exclusions

1. The cabling systems described herein are those to be provided in support of the electronic security system(s) only and are not related to the facilities information transport system specified in Division 27.

PART 2 PRODUCTS

2.1 GENERAL

A. Equipment specified is intended as a reference standard for level of quality.

B. Lists of products and manufacturers are Non-restrictive. Submission of an unnamed product or manufacturer does not require a substitution or change to the Contract Documents, but must comply with requirements for “Comparable Products” as outlined in Section 010 60 00 PRODUCT REQUIREMENTS.

C. Provide materials listed by UL or ETL.

2.2 FIBER OPTIC BACKBONE CABLE

A. Specifications

1. Multi Mode

a.	Core Diameter:	50 +/- 2.5 um
b.	Core Non-circularity:	5% max
c.	Cladding Diameter:	125 +/- 1 um
d.	Core/Clad Concentricity Error:	< 1.5 um
e.	Coating fiber diameter:	245 +/- 10 um
f.	Cladding Non-circularity:	<1%
g.	Coating/Cladding Concentricity Error:	<6 um
h.	Colored Fiber Diameter:	254 um
i.	Numerical Aperture:	.275 +/- .015
j.	Effective Group Index of Ref. @850nm:	1.496
k.	Effective Group Index of Ref. @1300nm:	1.491
l.	Point Discontinuities @ 850 and 1300 nm:	<.08dB
m.	Max. Fiber Loss @850:	3 dB/km
n.	Max. Fiber Loss @1300:	1 dB/km
o.	Minimum Bandwidth @ 850:	200 MHz-km
p.	Minimum Bandwidth @1300:	500 MHz-km
q.	NEC CMP rated	

2. Single mode

a.	Core Diameter:	8.3 um nominal
b.	Cladding Diameter:	125 +/- 1 um
c.	Core/Clad Concentricity Error:	< .5 um
d.	Coating fiber diameter:	245 +/- 10 um
e.	Cladding Non-circularity:	<1%
f.	Coating/Cladding Concentricity Error:	<12 um
g.	Colored Fiber Diameter:	254 um
h.	Effective Group Index of Ref. @1310 nm:	1.466
i.	Effective Group Index of Ref. @1550 nm:	1.467
j.	Point Discontinuities:	.1 dB
k.	Max. Fiber Loss @1310:	.7 dB/km
l.	Max. Fiber Loss @1550:	.7 dB/km
m.	NEC CMP rated	

B. Acceptable Manufacturer

1. Intra Building

a. AMP/Netconnect
b. Commscope/Uniprise/Systimax
c. Panduit/General Cable
d. Hubbell/Mohawk
e. Belden/CDT
f. Multi mode indoor plenum rated cable. Refer to drawings for strand count.

2.3 FIBER OPTIC PATCH PANEL

A. Specifications

1. 14 ga. CRS construction
2. 19 rack mount, 4 RMS (7” high)
3. Modular construction
4. Provide fiber management bend limiting clips
5. Provide strain relief brackets
6. Provide adapter panels to support the fiber optic strand count shown on the plans.

B. Acceptable Manufacturers

1. AMP/Netconnect
2. Commscope/Uniprise/Systimax
3. Panduit/General Cable
4. Hubbell/Mohawk
5. Belden/CDT
6. Leviton

2.4 FIBER OPTIC PATCH PANEL ADAPTOR PLATE

A. Specifications

1. SC duplex multi mode adaptors
2. Provide adaptor panels to support the fiber optic strand count shown on the plans.
3. Ferrell color based on cross-connect field identification color code, TDMM latest addition, chapter 7.

B. Acceptable Manufacturers

1. AMP/Netconnect
2. Commscope/Uniprise/Systimax
3. Panduit/General Cable
4. Hubbell/Mohawk
5. Belden/CDT
6. Leviton

2.5 FIBER OPTIC CONNECTORS

A. Specifications

1. Duplex SC type connector
2. High impact plastic body
3. Zerconia/Ceramic ferrule
4. .3dB typical insertion loss
5. –30dB/-40dB reflectance, Multimode respectively
6. 32° – 131° F operating temperature
7. 12 pound tensile strength
8. Ferrell color based on cross-connect field identification color code, TDMM latest edition, chapter 7.

B. Acceptable Manufacturers

1. AMP/Netconnect
2. Commscope/Uniprise/Systimax
3. Panduit/General Cable
4. Hubbell/Mohawk
5. Belden/CDT
6. Leviton

2.6 FIBER OPTIC PATCH CABLES

A. Specifications

1. Duplex SC connectors
2. Ferrell color based on cross-connect field identification color code, TDMM latest edition, chapter 7.
3. 2 meters in length.
4. Patch cables are to be turned over to the Owner for use in installation of active equipment outside the scope of the project.
5. Furnish mode patch cables to match strand count and configuration as shown on the plans.

B. Acceptable Manufacturers

1. AMP/Netconnect
2. Commscope/Uniprise/Systimax
3. Panduit/General Cable
4. Hubbell/Mohawk
5. Belden/CDT
6. Leviton

PART 3 EXECUTION

3.1 INSTALLATION

A. General

1. Install all fiber cabling in accordance with applicable standards and codes.
2. Maintain fire rating of all penetrations through rated walls during construction.
3. Coordinate fire stopping of all cable runs through floor sleeves with the General Contractor. Refer to Section 078400 - Firestopping.
4. Install all fiber cabling and secure utilizing wire management brackets and hook and loop type (Velcro™) straps. No plastic cable ties shall be used to secure any cabling.

B. Backbone Cabling

1. Install cabling as per manufacturer's instructions.
2. Do not exceed specified pulling tensions.
3. Do not exceed specified bend radius.
4. Provide a 3 meter maintenance loop of fiber cable in the cable tray prior to dropping into the cabinets.

5. All fiber optic cable shall be installed in plenum inner duct.

C. Fiber Optic Termination Enclosures

1. Install all cabling and secure utilizing wire management system.
2. Secure fiber jacket in a minimum of two locations.
3. Install minimum one meter of unjacketed fiber strands coiled on the enclosure routing guides.
4. Terminate and connect all fibers in fiber termination enclosure:

   a. Populate the single-mode fibers on the ports beginning with 1.
   b. Populate the multi-mode fibers on the next available port after the single-mode fibers.

5. Use only hook and loop (Velcro™) type straps to secure and dress fiber cables.

3.2 LABELING

A. General

1. Provide labeling based on ANSI/TIA/EIA-606A administration concepts for all conduits, fiber, patch panels, jacks, bus bars, racks, etc.
2. Provide machine generated typewritten labels, hand labeling is not acceptable

B. Equipment Room Terminating Hardware

1. Provide an identifier for each Patch Panel that incorporates the Cabinet identifier. (e.g. TR2A-RR3-PP1 is the first patch panel in the third relay rack in the first intermediate telecommunications room on the second floor)
2. Provide an identifier for each Patch Panel port that incorporates the Patch Panel identifier. (e.g. TR2A-RR3-PP1-09 is the ninth port on the first patch panel in the third relay rack in the first intermediate telecommunications room on the second floor)

C. Backbone Cable

1. Provide both of the cable's Patch Panel Port identifiers on both ends of all backbone cables.
2. Insure that label is intact after termination of cable.

3.3 TESTING

A. General

1. Certify system is complete and functional.
2. Test all cabling and connections. Perform final functional tests in presence of the Architect Engineer.
3. Complete certified testing report.

B. Fiber Cable Testing

1. All fiber testing shall be performed on all fibers in the completed end to end system.
2. Every fiber shall be tested in both directions with a light source tester.

3. There shall be no splices unless clearly defined in construction documents.
4. Maximum allowable attenuation for 50 micron fiber shall be 3.0 dB per km at 850nm and 1.0 dB per km at 1300 nm.
5. Maximum allowable attenuation for single mode fiber shall be .5 dB per km at 1310 nm and 0.4 dB per km at 1550 nm.
6. All testing shall follow TIA/EIA-TSB-140 (or later revisions of this document) standards.

END OF SECTION 28 05 11

SECTION 280512 - HORIZONTAL CABLING SYSTEM FOR ELECTRONIC SECURITY

PART 1 GENERAL

1.1 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SYSTEM DESCRIPTION

A. General

1. Provide a complete Horizontal Cabling system that supports voice, and data as indicated in Project Documents relative to the electronic security system(s).
2. Provide, equipment room rack mounted termination equipment, equipment room patch cables, work area outlets, work area equipment cables, terminations, labeling and testing for the Horizontal Cabling system as indicated in Project Documents.
3. Provide Fire stopping Materials for Horizontal Cabling as indicated in Project Documents, provide all labor and materials to maintain Fire stopping at all penetrations at all times during construction and to insure adequate Fire stopping at all penetrations at completion.
4. Provide all necessary materials and labor for the horizontal cabling system in all equipment rooms and closets as indicated in project documents.

B. Horizontal Cabling Subsystems

1. Provide a complete UTP horizontal cabling system as indicated in project documents relative to the electronic security system(s).
2. Provide UTP horizontal system cables, equipment room rack mounted UTP termination equipment, equipment room UTP patch cables, work area UTP jacks and faceplates, work area equipment cables, UTP terminations, labeling and testing for the UTP Horizontal Cabling system as indicated in Project Documents.

PART 2 PRODUCTS

2.1 GENERAL

A. Provide materials listed by UL or ETL. All cables shall be marked according to current standards.
B. All cable must be NEC type CMP unless installed in conduit from end to end.

2.2 UTP HORIZONTAL CABLE

A. Specifications

1. ANSI/EIA/TIA Category 6 compliant
2. Quantities and locations as indicated in Project Documents

3. 4 pair, 23 AWG, solid bare annealed copper
4. Flame retardant semi-rigid PVC insulation
5. Longitudinal rip-cord
6. Color based on cross-connect field identification color code, TDMM Latest edition, chapter 7.
7. All cables terminated per T568B.

B. Acceptable manufacturers

1. Panduit
2. Belden
3. Berk-Tek
4. Commscope
5. Superior Essex

2.3 PATCH PANELS

A. Specifications

1. Modular rack mounted
2. Release snap feature on faceplate allowing front access to installed modules.
3. Label version for easy port identification
4. Replacement label/label covers
5. Mount standard EIA 19” rack
6. Jack color to correspond with color of jack at work area outlet location.

B. Acceptable Manufacturers

1. Panduit
2. Belden
3. Berk-Tek
4. Commscope
5. Leviton

2.4 CATEGORY 6 RJ-45 JACKS

A. Specifications

1. Exceeds TIA/EIA-568-B.2 Category 6 and ISO 11801 2nd Edition Class D standards
2. Each jack is 100% tested to ensure NEXT and RL performance and is individually serialized for traceability
3. No punchdown tool required; termination tool ensures conductors are fully terminated by utilizing a smooth forward motion without impact on critical internal components for maximum reliability
4. Can be re-terminated a minimum of twenty times
5. Red termination cap designates Category 6 performance and provides a positive strain relief; helps control cable bend radius and securely retains wires
6. Terminates 4-pair, 22 – 26 AWG, 100 ohm, solid or stranded twisted pair cable
7. Termination cap is color coded for T568A and T568B wiring schemes
8. Accepts 6 and 8-position modular plugs without damage
9. Can be clearly identified with optional labels and icons
10. Colors include blue, white, green, yellow, red, or violet.

B. Acceptable Manufacturers

1. Panduit
2. Belden
3. Berk-Tek
4. Commscope
5. Leviton

2.5 CROSS CONNECT AND PATCH CABLE ASSEMBLIES

A. Specifications

1. ANSI/EIA/TIA Category 6
2. 4 pair RJ45
3. Bootless
4. All patch cables shall be an appropriate length. (this may require custom cable lengths in the telecommunications room)
5. Patch cables shall be constructed with cable of the same manufacturer as installed horizontal cable.

B. Acceptable Manufacturers

1. Panduit
2. Belden
3. Berk-Tek
4. Commscope
5. Leviton

PART 3 EXECUTION

3.1 INSTALLATION

A. General

1. Follow all ANSI/EIA/TIA installation guidelines
2. Follow all cabling solution provider installation guidelines
3. Install all cabling and secure utilizing wire management and hook and loop (Velcro™) Straps. No plastic cable ties shall be used to secure any cabling.

B. Equipment Rooms

1. Install all Horizontal Cable System equipment as indicated in Project Documents
2. Install cable management to support and train cables with spacing as required to meet bend radius and support requirements.

C. Work Area

1. Install all Horizontal Cabling System Work Area equipment and cabling as indicated in Project Documents
2. Do not exceed recommended pulling tensions
3. Route cabling from outlets to patch panel in equipment rooms or closets as indicated on the drawings.

4. Do not exceed 90 meter horizontal length for horizontal cables. Notify the Architect Engineer prior to install if any horizontal runs that have the potential of exceeding 90 meters.
5. Terminate data cabling per T568B wiring method.

    a. Maintain wire twists to within 0.5 inches of termination.
    b. Remove no more than 1.0 inches of cable jacket.

3.2 LABELING

A. Equipment Room Cabinet Labeling

1. Provide each cabinet a laminated black phenolic resin label with a white core and engraved lettering, a minimum of 1/4-inch high.

B. Equipment Room Patch Panel Labeling

1. Provide each Patch Panel with a laminated black phenolic resin label with a white core and engraved lettering, a minimum of 1/4-inch high.
2. Provide permanent, computer-generated labels at each Patch Panel port.

C. Horizontal Cable Labeling

1. Provide permanent, computer generated labels on both ends of every Horizontal Cable, Patch Cord and Work Area Equipment Cable.
2. Example of horizontal wiring label: 1A-A001 1A=Equipment Room number, A=the patch panel, and 001= patch panel port.

D. Work Area Outlet Labeling

1. Provide permanent, computer generated labels at the station faceplate

E. General

1. Provide labeling based on ANSI/TIA/EIA-606 administration concepts
2. Provide typewritten labels, hand labeling is not acceptable

F. Telecommunication Spaces and Pathways

1. Use the identifier ER for the Equipment Rooms
2. Provide a unique identifier for each Equipment Room that indicates the floor and an ordinal designation (e.g. ER2A is the first equipment room on the second floor)
3. Provide an identifier for each cabinet in each equipment room that incorporates the ER identifier (e.g. ER2A-RR3 is the third cabinet in the first equipment room on the second floor).
4. Provide an identifier for each cabling pathway

G. Equipment Room Terminating Hardware

1. Provide an identifier for each Patch Panel that incorporates the cabinet identifier (e.g. ER2A-EC3-PP1 is the first patch panel in the third equipment cabinet in the first equipment room on the second floor)
2. Provide an identifier for each Patch Panel port that incorporates the Patch Panel identifier (e.g. ER2A-EC3-PP1-09 is the ninth port on the first patch panel in the third

equipment cabinet in the first equipment room on the second floor)

H. Work Area

1. Provide an identifier for each Work Area Activation Point that indicates the room number and an ordinal designation (e.g. 142A is the first activation point in room 142).
2. Provide an identifier for each Work Area Activation Point jack that Work Area Activation Point designation (e.g. 142A-2 is the second jack in the first TO in room 142).

I. Horizontal Cable

1. Provide the cable's Patch Panel Port identifier and Work Area Activation Point Jack identifier on both ends of all Horizontal cables.
2. Insure that label is intact after termination of cable.

3.3 TESTING

A. Copper cable testing

1. Test all Category 6 horizontal cabling using a digital cable analyzer and certify that the system is complete and functional.
2. A level IIe or better test unit is required and must be updated to include the requirements of ANSI/TIA/EIA-568-B.
3. The basic tests required are:

   a. Wire Map
   b. Length
   c. Attenuation
   d. NEXT (Near and crosstalk)
   e. Return Loss
   f. Propagation Delay
   g. Delay Skew
   h. PSNEXT (Power sum near-end crosstalk loss)
   i. PSELFET (Power sum equal level far-end crosstalk loss)

END OF SECTION 28 05 12

SECTION 280513 - CONDUCTORS AND CABLES FOR ELECTRONIC SECURITY

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary conditions and Division 1 Specifications Sections, apply to this Section.

1.2 SYSTEM DESCRIPTION

A. General:

1. Provide a complete cabling system that supports, PLC/GUI, Surveillance, Intercommunications and other systems as indicated in Project Documents.
2. Provide all necessary materials for the cabling system in all equipment rooms and at all field devices as indicated in the project documents.

B. PLC/GUI Cabling Subsystems:

1. Provide a complete cabling system to support all door control field devices, power supplies, controllers, network devices and graphical user interface devices.
2. Include all termination and cable management as described in section 280500.

C. Video Surveillance Cabling Subsystem:

1. Provide a complete cabling system to support all video surveillance field devices, control and monitoring equipment and headend equipment.
2. Include all termination and cable management as described in section 280500.

D. Intercom Cabling Subsystem:

1. Provide a complete cabling system to support all intercom field devices, master stations, and controllers, expanders, amplifiers and ancillary devices.
2. Include all termination and cable management as described in section 280500

E. Access Control

1. Provide a complete cabling system that supports, Access Control, Request to Exit, Intercommunications and other systems as indicated in Project Documents.

F. Include all termination and cable management as described in section 280500.

PART 2 PRODUCTS

2.1 GENERAL

A. Provide materials listed by UL or ETL.

B. All cable must be NEC type CMP and installed in conduit from end to end.

2.2 MULTICONDUCTOR SHIELDED PAIRED CABLING

A. Specifications

1. #18 AWG 19 x 30 stranded tinned copper conductor
2. Overall aluminum polyester tape foil shield 100% coverage
3. 18 AWG drain wire
4. Pair count as appropriate to the application
5. Type CM jacket

B. Acceptable manufacturers

1. Belden
2. West Penn Wire
3. Commscope
4. Mohawk

2.3 MULTICONDUCTOR UNSHIELDED PAIRED CABLING

A. Specifications

1. #18 AWG 19 x 30 stranded tinned copper conductor
2. Pair count as appropriate to the application
3. Type CM jacket

B. Acceptable manufacturers

1. Belden
2. West Penn Wire
3. Alpha

2.4 LOW VOLTAGE BUILDING WIRE

A. Specifications:

1. Conform to system manufacturer's requirements regarding size and type.
2. Conforms to UL Article 444 for low smoke and low flame and rated for use in air plenums.
3. Conforms to NEC 300-21, 300-22, and 725-2.
4. Low voltage wire shall be type THHN, THWN, or TFFN as appropriate to the application.
5. All low voltage building wiring shall be installed in conduit.

B. Acceptable manufacturers

1. Atlas Wire
2. Cerrowire
3. Arthur J. Hurley Company

PART 3 EXECUTION

3.1 INSTALLATION

A. General:

1. Follow all ANSI/EIA/TIA installation guidelines
2. Follow all manufacturer installation guidelines
3. Follow all applicable NFPA and NEC codes

B. Cabling

1. Do not exceed recommended pulling tensions
2. Use only hook and loop type (Velcro™) Straps to secure and dress cabling.

3.2 LABELING

A. Equipment Room Cabinet Labeling:

1. Provide each cabinet with a laminated black phenolic resin label with a white core and engraved lettering, a minimum of 1/4-inch high.

B. Horizontal Cable Labeling:

1. Provide permanent, computer generated labels on both ends of every Horizontal Cable, Patch Cord and Equipment Cable

C. General:

1. Provide labeling based on ANSI/TIA/EIA-606 administration concepts
2. Provide typewritten labels, hand written labeling is not acceptable

END OF SECTION 28 05 13

SECTION 280526 - GROUNDING AND BONDING FOR ELECTRONIC SECURITY

PART 1 GENERAL

1.1 SYSTEM DESCRIPTION

A. Furnish all materials and labor necessary to complete the installation of specific systems described herein and integration of all systems as indicated, specified herein or both. The work includes the following, as well as work not listed below but described elsewhere:

1. Surge Protectors.

    a. Protection of exterior power circuits
    b. Protection of exterior data circuits
    c. Protection of exterior signal circuits
    d. Protection of power circuits entering equipment racks

2. Ground Circuits

    a. Ground circuitry for proper dissipation of lightning, voltage spikes, surges, transients and as required for life safety.

3. Back Up Power

    a. All microprocessor-based equipment shall be powered by an un-interruptible power supply (UPS). UPS is provided under division 26.

B. Security systems shall utilize the telecommunications grounding network outlined in 270526 and shown on the drawings.

PART 2 PRODUCTS

2.1 GENERAL

A. Equipment specified is intended as a reference standard for level of quality.

B. Lists of products and manufacturers are Non-restrictive. Submission of an unnamed product or manufacturer does not require a substitution or change to the Contract Documents, but must comply with requirements for “Comparable Products” as outlined in Section 010 60 00 PRODUCT REQUIREMENTS.

C. Provide materials listed by UL or ETL.

2.2 POWER LINE SURGE PROTECTION

A. Specifications

1.	Load Rating:	20 amps at 120 volts
2.	Limiters:	Series surge reactor current limiter. Cascaded auto-tracking dual polarity voltage limiter. Dual pulse inverters.
3.	Clamping Voltage Onset:	172 volts nominal (2 volts above peak line voltage, auto tracking)
4.	Filter:	With 50 ohm load: 3 dB @ 3 kHz; 38 dB @ 100 kHz; 50 dB @ 300 kHz; 50 dB @ 5 MHz; 50 dB @ 30 MHz.
5.	Let-Through Slew Rate:	5000 volt/us disturbance reduced to 28 volts/us within power wave envelope; less than 10 volts/us outside power wave envelope.
6.	Snubber:	Instant reacting snubber for fast-rising surges generated within the building.
7.	Max Applied Surge Pulse Voltage:	6000 volts (1.2 x 50 us pulse)
8.	Max Applied Surge Pulse Joule Rating: (8x20 us)	Unlimited, due to current limiting.
9.	Max Applied Surge Pulse Current:	100,000 amperes (8x20 us)
10.	UL 1449-2 Adjunct Classification Test Results:	1000 surges, 6000 volts, 3000 amps, C1 pulse, measured suppressed voltage 290 volts no failures.

B. Acceptable Manufacturer

1. SurgeX SX20-NE/RT, wall-mount applications. SurgeX SX2120, rack mount applications. Provide one power conditioner for each 20-amp circuit feeding security electronics equipment including access control, intercom, and CCTV.
2. Approved Equal.

2.3 DATA LINE SURGE PROTECTION

A. Specifications

1.	Primary Tech:	Bipolar Silicon Avalanche Diode
2.	Operating Frequency:	DC to 30 MHz
3.	Response Time:	<5 nanoseconds
4.	Protected Lines:	Two pairs
5.	Peak Pulse Energy Disp:	10 joules each mode
6.	Interface:	Wire clamp terminals
7.	Current Rating:	7 amps max
8.	Series Impedance:	<.01 ohms
9.	UL497B listed	

B. Acceptable Manufacturer

1. Northern Technologies PLP-S series surge protectors.
2. Ditek

3. Edco

2.4 RS-232 SURGE PROTECTION

A. Specifications

1.	Max Operating Voltage:	/- 20 V
2.	Typ. Leakage current:	5 u amps
3.	Max Data Rate:	22 kbps
4.	Max Surge Current (10x1000usec):	43 amps
5.	Max Clamp Voltage :	35 volts
6.	Max Transient Voltage :	6 kV
7.	Clamp Response Time:	< 1 nanosecond
8.	UL 497B listed	

B. Acceptable Manufacturers:

1. Edco SRS-232 series surge protector
2. Ditek
3. Northern Technologies

2.5 GROUNDING BUSS BAR

A. Specifications

1.	Predrilled solid copper	
2.	NEMA standard bolt hole spacing	
3.	0.25” thick minimum	
4.	Minimum dimensions: required	4” high x 12” wide size to accommodate connections.
5.	Mounting:	Minimum 2” insulated standoffs.
6.	Cover:	Lettered plexiglass as detailed in drawings.

B. Acceptable Manufactures

1. Panduit
2. Harger
3. Andrew

2.6 GROUNDING CONDUCTORS

A. Specifications

1.	Gauge:	As indicated on drawings
2.	Insulation:	Green PVC 600 volt rated

B. Acceptable Manufacturers

1. Harger
2. Tessco
3. Kris-Tech

2.7 TWO HOLE CODE CONDUCTOR

A. Specifications
   1. UL listed for use up to 35 KV
   2. Temperature rated 90 degrees Celsius
   3. CSA certified to 600V
   4. Meets J-STD-607-A
   5. Painting piercing washers required

B. Acceptable Manufacturer
   1. Panduit
   2. Harger
   3. Andrew

PART 3 EXECUTION

3.1 INSTALLATION

A. The System shall be installed by qualified personnel in strict compliance with manufacturer's instructions.

B. Wiring shall be color coded, uniform and in accordance with national electric codes and manufacturer's instructions.

C. Equipment shall be firmly secured, plumb and level.

D. All cable shall be tagged and identified.

E. Coordinate all work with other trades.

F. Ground all equipment as per manufacturer's recommendations, IEEE 1100, NEC, and EIA/TIA guidelines.

G. Provide equipment grounding conductor from equipment grounding lugs to ground bar. Size conductor based on length; see drawings for sizing requirements.

H. Provide a green insulated grounding conductor from rack to ground bar.

I. Provide secondary surge protection for all copper cable entering the building.

J. Grounding of security cables and peripheral equipment shall be installed per manufacturer's direction to eliminate noise induction and achieve optimum system performance.

K. The Trade Contractor shall provide power line surge and noise suppressor/filters for all equipment proposed. These devices shall buffer all video, control, and paging systems.

3.2 SYSTEM INITIALIZING AND PROGRAMMING

A. The power system shall be turned on and adjustment made to meet requirements of the specification and on-site conditions prior to powering any security systems.

B. Verify the output voltage of each power source outlet is within NEC guidelines for variation in voltage.

C. All UPS units shall be fully charged prior to powering any security systems.

3.3 GROUNDING

A. All equipment shall be grounded in accordance with the NEC, these specifications, and the equipment supplier's recommendations. Discrepancies shall be brought to the attention of the Architect Engineer for resolution prior to execution of the work.

B. Each equipment cabinet shall be bonded and grouped cabinets shall be bonded together and connected at a single point on ground buss bar.

3.4 LABELING

A. Provide an identifier for each Grounding Bus bar that incorporates the identifier of the space the bus bar serves.

B. Label both ends of all grounding conductors with both bus bars connected.

3.5 SPARE PARTS

1. Refer to section 28 05 10

3.6 SURGE PROTECTION

A. All security metallic data and video lines entering or leaving a building shall be protected with surge protection devices. This specification also applies to field devices mounted on the exterior of the building.

B. Grounding of protective devices shall be in accordance with the manufacturer's recommendations and/or as described in these specifications and drawings.

C. All signal line protective devices shall be located at the terminal point nearest the cable interface with the exterior cable plant. Devices shall be mounted to the back panel of the cabinet. Provide separate enclosure for all surge protection devices mounted in equipment cabinets.

3.7 SYSTEM TEST PROCEDURES

A. The System shall be completely tested to assure that all components are hooked up and in working order. Inspect system for defects. Correct all causes of such defects. If the cause is outside of the scope of the 28 series scope of work, promptly notify the Architect Engineer in writing, indicating the cause of the defect and suggested corrective procedures.

B. Provide written documentation showing all test results.

C. The System shall be final tested in the presence of the Architect Engineer.

3.8 OWNER INSTRUCTION

A. Instruct Owner on replacement of all user serviceable components including surge protectors, UPS units, breakers, and fuses.

END OF SECTION 28 05 26

SECTION 281116 - CABINETS AND ENCLOSURES FOR ELECTRONIC SECURITY

PART 1 - GENERAL

1.1 SYSTEM DESCRIPTION

A. Furnish and install all equipment, materials and labor necessary to complete the installation of specific systems described herein and integration of all systems as indicated, specified herein or both. The work includes the following, as well as work not listed below but described elsewhere:

1. Cabinets
2. Non-standard manufacturer furnished enclosures and back boxes

PART 2 - PRODUCT

2.1 GENERAL

A. Equipment specified is intended as a reference standard for level of quality.

B. Lists of products and manufacturers are Non-restrictive. Submission of an unnamed product or manufacturer does not require a substitution or change to the Contract Documents, but must comply with requirements for “Comparable Products” as outlined in Section 010 60 00 PRODUCT REQUIREMENTS.

C. Provide materials listed by UL or ETL.

2.2 FREE STANDING ELECTRONIC EQUIPMENT CABINETS

A. Specifications

1. Provide freestanding equipment cabinets to house 19” rack mountable equipment in the equipment rooms. Each cabinet shall have a rectangular frame with removable top panel, side panels and doors. Installed cabinets shall include thermal, power, and cable management accessories that control airflow through the cabinet and keep signal and power cables separate and organized
2. The cabinet frame shall be rectangular with four corner posts, manufactured from steel with welded frame construction. The sides of the frame shall be punched at the top and bottom with a hole pattern to allow attachment of equipment mounting rails and thermal, cable and power management accessories. The cabinet frame shall support 2000 lbs of equipment.
3. The cabinet shall be 27.6” wide by 36.3”deep by 88.8” high when doors, top panel and side panels are installed. Leveler feet will add approximately 1” to the height of the frame/cabinet.

4. Each cabinet shall include two pairs of equipment mounting rails. Mounting rails shall bolt to the side of the cabinet frame at the top and bottom of the frame and shall be adjustable in depth to provide front and rear support for equipment. Equipment Mounting Rails shall be spaced horizontally to support 19" wide EIA-310-D compliant rack-mount equipment and shall provide up to 30.3" of rail-to-rail depth for equipment. Mounting rails shall be square-punched according to the EIA-310-D Universal hole pattern with equipment mounting holes on alternating 5/8" – 5/8" – 1/2" vertical hole centers. Square-punched holes shall accept cage nut hardware with various threads. Rack mount spaces or units (RMU) shall be 1-3/4" high and shall be marked and numbered on the mounting rails. Numbering shall start at the bottom of the rail. Mounting rails shall provide 48 RMU for equipment
5. The cabinet shall include a solid top panel with one 3" x 11.5" cable access port located near the center of the frame. The cable access port shall be plastic with a brush seal to allow easy addition and removal of cables while limiting bypass airflow.
6. The cabinet shall include two locking solid side panels with spring loaded latches for easy installation and removal. The cabinet shall be designed to allow baying with or without side panels installed.
7. The cabinet shall include a single front door with a perforated metal panel, hidden tamper-resistant hinges with quick-release hinge pins and a swing handle. The door shall be removable and reversible to open from the right or left. The door shall open to 150° when the cabinet is bayed with other cabinets. The front door shall have a single-point slam latch with a keyed lock.
8. The cabinet shall include a Single rear door with a perforated metal panel, hidden tamper-resistant hinges with quick-release hinge pins and a swing handle. The door shall be removable and reversible to open from the right or left. The door shall open to 150° when the cabinet is bayed with other cabinets. The front door shall have a single-point slam latch with a keyed lock.
9. The cabinet frame, top panel and side panel shall be manufactured from steel. The door frames shall be manufactured from steel and aluminum. Door panels shall be steel. The door handle, side panel latches, rear door hinges and top panel cable access ports shall be plastic. The cabinet frame and front and rear door shall be welded and bolted. Cabinet components shall assemble with hardware.
10. The mounting rails, top panel, side panels and doors shall be electrically bonded to the cabinet frame.
11. The cabinet shall be UL Listed as an Information Technology and Communications Equipment Cabinet, Enclosure and Rack System to standard UL 60950 under category NWIN. UL Listing will be stated in the manufacturer's product literature.
12. The metal components of the cabinet frame, top panel, side panels, and doors shall be painted black with epoxy-polyester hybrid powder coat paint. The mounting rails shall be zinc-plated and silver-colored. Plastic components shall be black.
13. The cabinet shall include (4) leveling feet, (4) clamps for securing the leveling feet to the floor, cage nuts of size and type required to mount all equipment and a means for bonding the cabinet to the Telecommunications Grounding Busbar.

B. Acceptable Manufacturers

1. Atlas Soundolier
2. Middle Atlantic
3. Lowell
4. Approved Other

2.3 MISCELLANEOUS EQUIPMENT RACK PANELS AND VENTS

A. Blank Panels

1. Specifications

a. 16 gauge steel.
b. Flanged top and bottom.
c. Durable textured black powder coat finish.
d. Available in 1-6 space sizes.

2. Acceptable Manufacturers
3. Middle Atlantic SB Series
4. Atlas Soundolier
5. Lowell

B. Vent Panels

1. Specifications

a. 1/16” diameter hole with 1/8” staggered centers. 23% open area.
b. 16 gauge perforated steel.
c. Flanged top and bottom.
d. Durable black powder coat finish.
e. Available in 1-4 space sizes.

2. Acceptable Manufacturers

a. Middle Atlantic VTF Series
b. Atlas Soundolier
c. Lowell

2.4 FREE STANDING EQUIPMENT CABINET COOLING FAN

A. Specifications

1. 115V 10” fan
2. Ball bearing design
3. Fan guard
4. Proportional speed control
5. Free air CFM, 500
6. Thermostatic fan control

B. Acceptable Manufacturer

1. Middle Atlantic MW-10FT-FC fan and control. Furnish one for each free standing equipment cabinet. Provide vent blockers in accordance with manufacturers recommendations.
2. Lowell
3. Atlas Sound

2.5 POWER DISTRIBUTION UNITS

A. Specifications

1. 120 VAC output nominal
2. Max total current draw 16 Amps
3. NEMA L5-20P single phase locking plug
4. NEMA 5-20R receptacles (quantity of ??)
5. One, 3 meter line cord
6. Vertical rack design

B. Acceptable manufacturers

1. APC AP7530
2. Middle Atlantic
3. Lowell
   CPI

2.6 NEMA RATED SECURITY EQUIPMENT ENCLOSURES

A. Specifications

1. All equipment enclosures installed indoors shall be NEMA 12 enclosures.
2. All equipment enclosures installed outside or exposed to weather shall be NEMA 4X enclosures.
3. Provide double door, continuous hinge enclosures
4. Enclosures shall be constructed of 14 gauge rolled steel, minimum.
5. Enclosure doors shall be furnished with key lock-able doors with all Enclosures under Division 28 keyed alike.
6. All enclosures shall be furnished with removable steel back panels for mounting equipment.
7. 60” x 48” and larger enclosures will be equipped with floor standing “feet”
8. Enclosures shall be grounded as specified in Section 28 05 26.
9. All enclosures shall be furnished with black-on-white laminated plastic nameplates identifying each cabinet.
10. Enclosures finish shall be ANSI 61 gray inside and out.
11. Enclosures shall be sized in strict accordance with the NEC. Minimum size is as indicated on the drawings.
12. Enclosure back panels shall be furnished with a grounding lug to be used to connect the cabinet to the signal grounding system specified in section 28 05 26.
13. Enclosures shall be furnished with cross-ventilated, forced-air cooling to maintain the optimum temperature performance range of the equipment.

B. Acceptable Manufacturers

1. Hoffman.
2. Wiegmann
3. Hammond Manufacturing
4. Saginaw Control and Engineering

PART 3 - EXECUTION

3.1 INSTALLATION

A. The System shall be installed by qualified personnel in strict compliance with manufacturer's instructions.

B. All equipment cabinets are to be assembled and tested in the Security Electronics Contractor's facility prior to on-site installation. With the exception of field wiring, all interconnecting cables should be terminated and installed. All power distribution shall be completed.

C. Wiring shall be color coded, uniform and in accordance with national electric codes and manufacturer's instructions.

D. Equipment shall be firmly secured, plumb and level.

E. Cabinets shall be installed with the minimum NEC clearance of three feet in the front and three feet in the rear of the cabinet.

F. All cable shall be tagged and identified.

G. Provide Panduit IN-Cabinet cable management system. segregate cabling into groups based on signal type and voltage.

H. All power cables lengths are to be kept to a minimum and plugged into the nearest power outlet. Additional cable length shall be bundled and tied together using nylon cable ties.

I. Maintain separation between 120VAC power cables and all signal level cables. When necessary, cross 120VAC power cables perpendicular to all other cable types.

J. Coordinate all work with General Contractor and other trades contractors.

K. Grounding of audio cables and peripheral equipment shall be installed per manufacturer's direction to eliminate noise induction and achieve optimum system performance.

L. All entrance and exit conduit shall utilize grounding bushings to terminate the conduit to the equipment enclosure. Route a green insulated ground conductor to the TMGB/TGB. See drawings for conductor sizing based on length.

M. Blank panels and vent panels shall be used to fill all unused rack space.

N. Every equipment rack shall be equipped with a ventilation fan and adequate venting. The fan shall be installed to bring air in from the bottom of the rack, drawing the cool air up and exiting out the top.

O. Provide security covers for all rack mounted electronic components that do not require user interface.

P. The Trade Contractor is responsible for 120VAC power distribution within the equipment racks.

Q. Upon completion of the work, remove excess debris, materials, equipment, apparatus, tools etc. and leave the premises clean, neat and orderly.

3.2 SYSTEM TEST PROCEDURES

A. Verify that all doors open and close without obstruction.

B. Verify that cabinet fans are capable of circulating cool air throughout the equipment rack.

C. Verify that all door locks function properly.

D. Provide written documentation showing all test results.

E. The system shall be final tested in the presence of the Architect Engineer.

END OF SECTION 28 11 16

SECTION 28 13 00 - ACCESS CONTROL SYSTEM FOR ELECTRONIC SECURITY

PART 1 - GENERAL

1.1 SYSTEM DESCRIPTION

A. Furnish all materials and labor necessary to complete the installation of specific systems described herein and integration of all systems as indicated, specified herein or both. The work includes the following, as well as work not listed below but described elsewhere:

1. Furnish and install a complete and functional access control system. Provide coordination to ensure that the system furnished includes integration of or interfacing to all devices and systems.
2. Provide programming that integrates control and monitoring of devices indicated in the project documents.
3. Access control system shall interface with the PLC Security Controls Systems allowing full control and monitoring of the access control system thru the PLC graphical user interface.
4. Proximity card readers shall interface with the access control system. Card data base, door schedules, event schedules, etc. will be maintained on the access control software.
5. Access control panel relay outputs shall interface with the security controls systems. Valid card reads shall initiate relay closures that in turn initiate the door open sequence.
6. Access control panel relay feeds PLC input as valid read request to exit.
7. Electro mechanical locking devices and door position switches shall terminate to the PLC I/O.

B. Furnish all software and programming labor necessary to complete the installation of specific systems described herein and integration of all systems as indicated, specified herein or both. The work includes the following, as well as work not listed below but described elsewhere:

1. Programming of Access Control Computer and Controllers. Include programming that implements system management, control, and information storage data bases.

C. System Configuration

1. The access control system shall be a modular and network capable system. The system shall have the ability of handling multiple remote sites and be compatible with various reader technologies supported simultaneously. The system shall allow for easy expansion or modification of readers, inputs, and outputs. The system control at the central computer location shall be under a single software program control, shall provide full integration of all components, and shall be alterable at any time, depending upon the facility requirements. Reconfiguration shall be accomplished on-line through system programming, without hardware changes.
2. Access control functions shall include, validation based on time of day, day of week, holiday scheduling, automatic or manual retrieval of cardholder photographs, and access validation based on positive verification of card, card/PIN, and PIN.
3. Utilizing assigned passwords, it shall be possible to define the levels of system operation for each individual Operator. Operator Actions range from basic monitoring

to full control of the system databases.

4. The method of communication from remote locations to the central components shall be transparent to the user.
5. After installation, the OWNER shall be able to perform hardware configuration changes as desired without the services of the Trade Contractor.
6. Equipment repair shall be able to be accomplished on site, by module replacement, utilizing spare components.
7. The system programming shall be user-friendly Windows environment (use conventional “Title Bar”, “Menu Bar”, “Tool Bar” and “Status Bar”) and allow mouse control of key functions. The programming shall be MENU driven and include on-line “Documentation”, “Help” or “Tutorial” information, as well as on-line data entry examples. The software shall utilize combo boxes for all previously entered system-required data. The system shall provide supervised alarm point monitoring. Upon recognition of an alarm, the system shall be capable of displaying alarm information in text format, on a graphic floor plan, and switching video surveillance cameras that are associated with the alarm point. The system shall be capable of arming or disarming alarm points both manually and automatically, by time of day, and day of week.

PART 2 PRODUCTS

2.1 GENERAL

A. Equipment specified is intended as a reference standard for level of quality.
B. Lists of products and manufacturers are Non-restrictive. Submission of an unnamed product or manufacturer does not require a substitution or change to the Contract Documents, but must comply with requirements for “Comparable Products” as outlined in Section 010 60 00 PRODUCT REQUIREMENTS.
C. Provide materials listed by UL or ETL.

2.2 CONTROLLER

A. Specifications

1. The controller board shall be microprocessor based, incorporating Flash ROM (firmware) downloadable from the Host Computer, RAM (User Information, System Setups, Event Transaction Buffer) and a Clock/Calendar. The ROM shall be modularly upgradeable in the field for enhancements to system features. Fuses shall protect all powered connections to the controller board. All wiring connections to the controller board shall be to "Phoenix" type screw terminals. Each door connection shall consist of terminals for two readers, one 10 Amp rated Form C dry output relay for lock control, and one input for monitoring a status switch, a request-to-exit device, and a tamper switch. There shall be status indicator lights for active relays, as well as diagnostic indicator lights to aid in system troubleshooting. There shall be dedicated alarm output relay/s for external reporting of the following conditions: Alarm; Duress; Tamper; and Trouble.
2. All controllers shall be mounted in the Security electronics equipment rack. Controllers shall be securely fastened to the enclosure.
3. The controller shall have an internal power supply that shall accept 50 Hz/ 200 - 240 VAC, or 60 Hz/100 - 120 VAC. The primary side of the power supply shall be protected with a fuse. The power supply shall provide 28 VDC power to the controller board, internal battery charger, selected card readers, and reader interface boards.

4. The controller shall have an internal standby battery that is capable of running the system during AC power interruptions. A charging circuit incorporated into the controller board shall recharge it.
5. A maximum of 5 expansion boards can be installed in each controller, with the exception of 4 in the 1-64 relay expansion board
6. The controller shall be capable of accepting up to 32 additional supervised alarm inputs, in increments of 8. The sensitivity of the line supervision shall be 2%. The alarm expansion boards shall be mounted in the controller cabinet and connect to the controller board via an expansion bus cable. This option shall be limited to 16 additional supervised alarm inputs for the 16-zone alarm input controller.
7. The two access control and 1 alarm monitoring controllers shall be capable of accepting up to 32 additional Form C, 2 Amp rated relay outputs in increments of 8. The 1 - 32 relay controller shall accept up to a maximum of 24 additional Form C, 2 Amp rated relay outputs in increments of 8. The 1 - 64 relay controller shall not accept any additional relay outputs. These outputs shall be used for control applications other than standard door access, such as elevator floor control, local door annunciators, HVAC interface, etc. The relay expansion boards shall be mounted in the controller cabinet and connect to the controller board via an expansion bus cable.
8. The controller shall be capable of expanding the CODE database up to a maximum of 132,000 Users with the addition of a memory expansion board. The board shall be mounted in the controller cabinet and connect to the controller board via an expansion bus cable.
9. The controller shall be capable of expanding the event transaction buffer up to a maximum of 20,000 events and 2,000 alarms with the addition of a memory expansion board. The board shall be mounted in the controller cabinet and connect to the controller board via an expansion bus cable.
10. The control panels shall utilize an intelligent reader interface to communicate with card readers of various types. The interface shall be microprocessor based and allow data formats including ABA magnetic stripe, Wiegand (26 to 55 bit), Proximity, Bar Code, Touch Memory, Barium Ferrite, RF and Biometric. The interface shall utilize a digitizing algorithm, which shall convert the card data to a unique number, thus, eliminating the need for facility codes. A single interface shall support both entrance and exit readers with keypads associated with each door. The interface shall be U.L. Listed to U.L.294. The reader interface shall be included as standard in all Scramble Pads.

B. Acceptable Manufacturers

1. Hirsch Electronics Digi*trac Series Control Panels. Provide quantity and configuration as required to support quantity of doors shown on plans. Associated controller is to remain on the same floor as the door controlled.

    a. Hirsch Identiv Velocity M8N eight door controller.
    b. Lenel
    c. Approved Equal

2.3 ACCESS CONTROL SERVER

A. Specifications

1. 1RU Rack Mount
2. Windows Server 2012 standard, 64 bit OS
3. Intel Xeon E5-2603 Processor 1.8 GHz 4C 10M 6.4GT Hyper T 80 Watt

4. 16 GB 1RX4 RDIMM DDR3 1600
5. (4) 1TB 3.5" SATA enterprise hard drive 7.2K, 6 GB/s Hot Swap
6. Slim SATA DVD Optical
7. Mouse
8. Keyboard
9. Single monitor video card
10. Intel Pro/1000 PT Dual Port 1GB Ethernet Adapter
11. Dual 800 Watt Redundant PS
12. 3 Year onsite service

B. Acceptable Manufactures

1. Lenovo Thinkserver RD530
2. HP
3. Hirsch Identiv
4. Approved Equal

2.4 RACK MOUNT KEYBOARD/MOUSE/MONITOR

A. Specifications

1. Slide out rack mount keyboard monitor
2. Full 105 key style keyboard and touchpad
3. Installed keylock for security
4. 1280 x 1024 screen resolution
5. LCD can be in open position for system monitoring while keyboard is closed
6. PS/2 and USB adapter

B. Acceptable Manufacturer

1. Middle Atlantic RM-KB-LCD17
2. Approved Equal

2.5 POWER SUPPLIES

A. No access control power supplies are required. Switching of power to the door locks shall be accomplished via the PLC and its associated interposing relays. Access control system outputs shall only be configured as request to exit inputs to the PLC.

2.6 ALARM LINE MODULES

A. Specifications

1. High Security Alarm Inputs
2. 2% Line Supervision
3. Monitor up to 3 Discrete Inputs

    a. Alarm or Door Status
    b. Alarm Masking or Request to Exit
    c. Tamper Alarm, Tamper Secure

B. Acceptable Manufacturer

1. Hirsch Identiv Electronics - DTLM3
2. Lenel
3. Approved Equal

2.7 ALARM EXPANSION BOARD

A. Specifications

1. 8 Supervised inputs
2. 2% line supervision
3. Mounted in controller cabinet

B. Acceptable Manufacturer

1. Hirsch Identiv- AEB8
2. Lenel
3. Approved Equal

2.8 NETWORK INTERFACE BOARD

A. Specifications

1. Optically isolated
2. RS-485 and RS-232 ports
3. 115 KBps Baud Rate
4. Supports AES encryption
5. Mounts inside model 8
6. Screw terminal connections

B. Acceptable Manufacturer

1. Hirsch Identiv– SNIB2
2. Lenel
3. Approved Equal

2.9 RELAY EXPANSION BOARD

A. Specifications

1. Provide 8 expansion relay outputs
2. 2 amp form C SPDT contacts
3. Up to 5 boards/40 relays per controller

B. Acceptable Manufacturer

1. Hirsch Identiv- REB-8
2. Lenel
3. Approved Equal

2.10 MATCH READER INTERFACE BOARD

A. Specifications

1. Dual technology entry and exit control
2. Provides 5VDC @ 250mA reader power
3. UL Listed

B. Acceptable Manufacturer

1. Hirsch Identiv– MRIB
2. Lenel
3. Approved Equal

2.11 WALL MOUNT PROXIMITY READERS

A. Specifications

1. 13.56 MHz.
2. 3.25” iClass Card maximum read range
3. 2” iClass Key/Tag maximum read range
4. Compatible with iClass 2kbits, 16kbits, 32kbits
5. Encrypted algorithm data transmission between card and reader
6. 64-bit authentication key

B. Approved Manufacturer

1. HID iClass readers. Provide model 6120B R40 reader for standard wall mount applications. Provide 6100B R10 for mullion mount applications.
2. Approved Equal

2.12 PROXIMITY CARDS

A. Specifications

1. Graphics quality.
2. Printable PVC card
3. Sequentially numbered
4. Encoded
5. 2K EEPROM with 16 application sectors

B. Acceptable Manufacturer

1. HID 202X iClass Proximity Card. Furnish 500 cards.
2. Approved Equal

2.13 NETWORK SWITCH

A. Specifications

1. (24) Ethernet 10/100/1000 ports, (4) shared SFB/GBIC 1000ports

2. Switching fabric: 68 Gbps
3. Forwarding rate: 50 mpps
4. Memory: 64 MB DRAM & 32 MB flash
5. MAC addresses: Up to 10,000
6. IGMP groups/Multicast routes: Up to 255
7. Configurable MTU: 10000 Bytes with jumbo frames
8. 1000BaseT ports: RJ-45 connectors
9. Stacking: Minimum 16 switches
10. Stacking Backplane: 10gbps
11. Input power: 100 – 240 VAC auto-ranging
12. Indicators:
    a. Port link integrity
    b. Port disabled
    c. Port speed
    d. Port full duplex
    e. System status
    f. System RPS
    g. System link status
    h. System link duplex
    i. System link speed
13. Operating Temp: 0 to 50 degrees C
14. Operating relative humidity: 10 – 85% non-condensing
15. Power consumption: 40 Watts max (120VAC)
16. Certifications: UL listed, FCC part 15 Class A
17. POE: IEEE 802.3af on all ports simultaneously

B. Acceptable Manufacturers

1. IFS NS3601-24P/4S
2. Cisco
3. HP
4. Approved Equal

2.14 REQUEST TO EXIT PIR

A. Specifications

1. Passive infrared device
2. DSP filter technology
3. Curtain Fresnel lens
4. 12 VDC @ 50 mA
5. SPDT relay 1 Amp @ 30 VDC
6. ½ to 60 second main relay timer
7. UL 294 listed

B. Acceptable manufacturer

1. Detection Systems DS160
2. Bosch DS 150i
3. Approved Equal

2.15 ACCESS MANAGER SOFTWARE - SERVER

A. Specifications

1. General layout of the software “Windows” shall include but not be limited to:

a. **Main Menu Bar** shall be used to access all Functions from a standard pull down menu method.
b. **Tool Tips** describing the feature(s) that the selected item represent, shall be displayed in small “bubbles” underneath the selected item, field caption or other component. These tool tips shall be user definable.
c. **The Administration Console** shall use the familiar Explorer metaphor with a tree of folders in the left pane and details of selected folders in the right pane. The left pane shall include the following main components: Main Administration Console, Software System Configuration, Hardware Configuration, and Interface Configuration.
d. The Main Administration Console shall include:

1) Browser
2) Customization Manager
3) Enrollment Manager
4) Event Viewer
5) Graphics
6) Report Manager
7) Status Viewer
8) SQL Manager
9) Task Scheduler

e. The Software System Configuration Module shall include:

1) Credential Templates
2) Time Zones
3) Holidays
4) Door Groups
5) Function Groups
6) Operators
7) Operator Groups
8) Command Sets

f. The Hardware Configuration Module shall contain:

1) Add either an S*NET or X*NET communications port, either serial or TCP/IP
2) Add hardware Controller
3) Doors, Readers, Inputs, Outputs, Expansion Inputs, Expansion Outputs

g. The Interface Configuration Module shall define the parameters for communicating to a CCTV switcher.

2. **Dialog Boxes** shall provide a means for entering information into fields and displaying information from the System Software database.

3. Workstation Customization

a. The Operator may customize the general functionality of several features of the System Software per individual Operator. The features that may be customized will include but not be limited to: Alarm Viewer, Event Viewer, and customizable Graphical User Interface.

4. The system shall allow the Operator to initiate a search for information in the database to be entered into another database field and shall allow the Operator to specify at least two search criteria such as Field and Data.
5. Time Zones define periods during which readers, cards, codes, alarm inputs, doors or other system features are active or inactive. Basic configuration parameters shall "ask" the Operator to define "when" the user is enabling (or disabling) a specific feature. In addition to Monday-Sunday, there shall be one day of the week called Holiday. When selected, there shall be 4 Holiday Schedules that determine if the Holiday is to be followed for this Time Zone. There shall be 64 Standard Time Zones, 64 Master Time Zones, and 20 Grand Master Time Zones.

    a. Holidays- Holidays are used within the system for the purpose of defining if a Time Zone is to be followed on a defined Holiday. Each Time Zone has up to 4 Holiday schedules. There are 366 user definable Holidays this year and 366 days next year. It shall be possible for the Operator to "Make the rest of Today a Holiday".
    b. Door Groups- Door Groups shall allow the user to establish groups of readers, each with its own unique Time Zone, at a facility for the purpose of granting or denying access to Credentials. Door Groups are assigned to Credential Templates, and people being added to the system take on the Door Group of the Credential Template selected during the enrollment process. A new Door Group may be defined when adding a Credential or Credential Template without having to exit and re-enter the Credential function for that Person.
    c. The Door Group application shall allow the user to view any existing Door Group listed in the dialog box. A user, with proper authority, shall be able to modify, add, or delete a Door Group from the System Software.

6. Function Groups- Credentials can be assigned to perform a single User Function, like Momentary Access. When a Person requires multiple User Functions, a Function Group may be defined and associated with one or more credentials. The Function Group requires a Scramble Pad keypad to be used, where the Person's base Credential PIN number is entered, followed by an * (Asterisk), followed by a one or two digit Extension digit, which defines which User Function shall be issued for which Control Zone. This allows for a single person to perform multiple User Functions like: Unlock Door, Relock Door, Change Threat Level, Mask Alarm Inputs, and Lock Down Doors.
7. A Credential Template shall be used when adding Credentials to people. The Credential shall take on the properties of the Credential Template selected. This shall minimize the number of keystrokes and time required to add a Credential to a person. The Credential Template properties include: Credential Name; Badge Template; Activation and Expiration Date and Time; ID Format; Card Type; Code Length; Duress Digit; Credential Function and Category; Door Group or Function Group; Threat Authority; 2 Person Rule options; Use Count, Day Limit, and Absentee Limits; Apply Credential Management Globally; Tag, Alert, Disable Credential; Issue Number; Status; Executive Override for Passback; Special Needs Access Extension.
8. A Command Set defines an action or actions to be sent to a controller or controllers. Command Sets can include: Unlock and Relock a Door; LockDown and Release a LockDown on one or more doors; make the rest of today a Holiday; Mask all Interior Alarm Points; change the facility Threat Level; Forgive All Passback. Once defined, a Command Set can be executed from the Command Set Window, or from a Graphic

Floor plan ICON, if defined. There shall be an unlimited number of Command Sets available to be defined.

9. Each Operator entered into the System Software system shall be assigned to an "Operator Group". This feature shall allow the Operator to take on the Rights to Components, Reports and Graphic Floor plans. The Rights for Components can grant or deny the ability to Add, Delete, Save, or Open a component, as well as restrict to the Properties or Dialog boxes to the Tabbed level.
10. Operators entered into the system shall take on the Rights of the Operator Group to which they are assigned. In addition, a unique set of Permissions can be defined per Operator which grant or deny the Operator's ability to perform system functions, like: Acknowledge and Clear 1 or more alarms; Assign/Un-assign Credentials; Change Alarm and Event Viewer Properties; Display Scramble*Pad Codes; Download Credentials; Preview and Print Badges; Use any or all of the Component Windows.
11. There shall be a Task Scheduler that allows functions to be performed on an as needed basis, like activating and deactivating credentials. It can also schedule Tasks like Synchronize Controller Clocks and Run Historical Log Archiver on a Daily, Weekly, Monthly basis.
12. The SQL Database Manager shall be used to Backup and Restore data from the SQL database. Manual or automatic backups may be defined. SQL Scripts may also be run from the SQL Database Manager.
13. There shall be a Diagnostic Window available to aid in system diagnostics / troubleshooting. Once a Controller is selected, the Standard Setup and Status diagnostic commands may be selected from a drop down list and sent to the selected controller. The response from the controller is displayed in the Diagnostic Window, and may be viewed, copied to the clipboard, a Report created and printed or saved to a file.
14. In addition, any supported command can be sent to the selected controller.
15. There shall be a Status Viewer which displays in a spreadsheets type format, the real-time status of all or selected Doors, Readers, Inputs, Relays, Expansion Inputs, Expansion Relays. Devices may be grouped in to "Status Groups", which are selectable from a drop down list. Devices may have selected information displayed. The available list includes the following:

    a. Name and Address
    b. Status
    c. Alarm and Acknowledged Status
    d. Masking Status
    e. Line Module Input Status and Type
    f. Relay Status
    g. Revision Number
    h. Enabled Status
    i. Controller Alarm Relay, Tamper, and Battery Status.

16. Foreground, Background, and Secure colors may be changed. In addition, the Columns of data viewed in the Alarm and Acknowledged windows may be selected and the sequence in which they shall appear. The available columns include:

    a. ICON
    b. Controller Time
    c. Host Time
    d. Description
    e. Address
    f. Level
    g. Acknowledge Time and Acknowledged By (available for the Acknowledged Pane)

17. Tool bar ICONS shall include:

    a. Acknowledge Selected
    b. Clear Selected
    c. Acknowledge All
    d. Clear All
    e. Silence Beeper
    f. Add Note

18. The Event Viewer can display all or Filtered Transactions. Custom files may be defined and selected, or standard selections can be made for main categories of Event types. Column width, order, selection, and scrolling direction are user definable, as well as text and background color.
19. The number of cached events to load when launched, up to 10,000, may be defined. The Operator shall be able to scroll back in time to view events no longer seen on the screen, without the need for running a report.
20. The browser shall be an Internet Explorer like “Browser” for accessing on-line help, tutorials (AVI files), manuals, Known Issues, and Product Registration information.
21. There shall be a Customization Manager that allows the Operator to define an alternate language or change the English name or label for each element of the software.
22. Priority Levels may be defined (1-99) for each Alarm Type.
23. The Report Manager shall allow the Operator to select from a number of pre-defined Reports. Custom Reports can be created outside the software, and added to a Custom folder, making the Custom Reports available from within the Report Manager application.
24. Once a Report is selected, the default Criteria and sorting options may be used, or custom Criteria and sorting options may be selected.
25. Once the report is run, it may be viewed, printed, or saved in various standard file formats.
26. Standard Reports included as standard shall include:

    a. Customization Reports

        1) Component Resources
        2) Customizations Report

    b. Control Configuration

        1) Controllers
        2) Doors
        3) Expansion Inputs
        4) Expansion Relays
        5) Inputs
        6) Network Layout
        7) Printers
        8) Readers
        9) Relays

    c. History Logs

        1) All Events Log
        2) External Events Log
        3) Internal Events Log
        4) Operator Log

5) User Activity Log

d. Person Information

1) Credential Status
2) Door Access by Person
3) Dossier Style by Person
4) Expired and To-Be-Expired Person Access
5) Expired Credentials
6) Last Access by Person
7) Person Access and Function Group Summary
8) Person Access and Function Group Summary with Codes and Cards
9) Person Access by Door
10) Person Access Summary
11) Person Access Summary with Codes and Cards
12) Person FG Summary with Codes and Cards
13) Person Function Group Summary

e. Software Configuration

1) Command Sets
2) Door Groups
3) Function Group Extensions
4) Functions Groups with Users
5) Functions with Users
6) Holiday Schedules
7) Holidays
8) Operator Groups
9) Operators
10) Time Zones – Grand Master Time Zone
11) Time Zones – Master Time Zone
12) Time Zones – Standard Time Zone
13) Time Zones – Standard Time Zones in Use

27. The Console Preferences shall define specific settings or devices for use with Velocity. These shall include: File Paths; Show Splash Screen on Startup; Access and Enable Customized Values for Components in Customization Manager; Use 24-Hour Time Format; SQL Server and Network Connections settings; Enrollment Station properties; and Report.
28. This function shall contain the required definition of the hardware components of the system. The database files shall be based on the hierarchy of the system hardware as it is physically installed in the field.
29. Controller Properties shall define all General settings for the Controller. These setting shall include: Name, Type, Address, Local Time Zone, Enabled Status, Firmware Revision Number and Date, Expansion Option Boards Installed and available Hardware. All additional Controller Setup Options can be defined here and are detailed in the Firmware Features section below.
30. The Controller Device Properties shall define all connected field devices, including: Doors, Readers, Inputs, Relays, Expansion Inputs, and Expansion Relays. Device names and all operating parameters shall be definable if operation other than the included defaults is required.
31. The Graphics application shall allow the Operator to add, delete or modify graphic floor plans and add indicator icons to graphic floor plans that represent Controllers, input/output points, readers, or cameras located in the facility. Formats for Graphics supported include two Modes, Live and Design. The Live mode shall be used for real

time monitoring. In addition, right clicking an ICON presents the Operator with a list of available Access or Control Functions that can be issued to the device. The Design mode allows the Operator to define which graphics are to be used, place ICONS on the Graphics, and define properties for each ICON.

32. There shall be a Bird's Eye Viewer that provides a key plan that can be panned and scrolled by moving the red box, which indicates the current viewing area.
33. There shall be a Directory of available Graphics to easily select the desired Graphic to display.
34. An Object Toolbar shall be available for selecting Objects to appear on the Badge Template, including: Bit Map Logos, Photos, Fixed Text, and Database Fields. Each Object shall have a Properties box where the specific Properties of that Object are defined, including: File, database field, Font color, Font Style, Font Size.
35. The Enrollment Manager application shall maintain information related to a Person, and Credentials assigned to that person. Multiple Credentials per person shall be supported. The list of People shall be able to have Custom filters applied, allowing for quick and easy grouping of desired people. There shall be a quick find option for finding a specific person or credential.
36. The Personal Information pane shall include the General and Additional User Defined fields. The system shall be capable of defining up to 36 user definable fields of information per Person. These field names can be either a "Text Box", "Dropdown" where the Operator can enter text, or select from a Dropdown List, or a "Dropdown List" where selecting from the List is required. A Photo field shall be available for acquiring a live video image, acquire an image from a TWAIN device, or acquiring a photo from an existing file. A Record Last Updated field shall be available, as well as Preview and Print a Badge. A signature field shall also be available.
37. Once a person is added, one or more Credentials may be added to that Person. Credentials may be added using a Credential Template, or directly without a Credential Template. The Credential shall take on the properties of the Credential Template if used. There shall be a Card Enrollment Station used for entering card data into the system. PIN Numbers can either be randomly selected, or Operator/User selected.
38. Once a Person is selected from the List, the Credential Status and information is displayed for the assigned Credentials. The information includes: IDF, ID, Function, Description, Status, Expires On, Last Access, Last Door, Tag, and Alert. An Operator may right click on a Credential, and shall be presented with the following options: Tag, Alert, Disable, Forgive Passback, Override Code Tamper, Reset Limit Count, Force Download, Un-assign, Delete, and Properties.
39. The bottom of the Enrollment Manager window shall display counters for: People, Assigned Credentials, Unassigned Credentials, and Guest Credentials.

B. Acceptable Manufacturers

1. Hirsch Identiv Velocity System Software Package
2. Lenel
3. Approved Equal

2.16 CONTROLLER FIRMWARE

A. Specifications

1. The software for the controller shall reside in Flash ROM (firmware) and be located on a plug removable module on the controller board to facilitate easy field up-gradability of the features. All of the necessary software for a fully functional System is located in the controller. The controller firmware shall include the following general

features at a minimum and be fully supported by the head-end.

a. 3 - 15 digit keypad Code's
b. Duress digit for keypad Code's
c. 150 Time Zones for access restriction and automatic event control
d. 128 Access Zones for access management
e. 256 Control Zones for alarm and relay management
f. 366 programmable holidays this year, 366 days next year. Each Holiday may be assigned to 1 – 4 Holiday Schedules.
g. Automatic daylight savings time clock adjustment
h. 27 different functions for Code's and cards, e.g. access, unlock, re-lock, alarm mask, relay control
i. Add user records
j. Tag users for annunciation at host computer
k. 4,000 Users
l. 750 event, 750 alarm transaction buffer

2. The controller shall include the following access control features at a minimum.

a. Restrict access by: time of day; day of week; door; holiday
b. Momentary Access of door up to 8100 seconds
c. Extended Access for User Definable Momentary Access duration (requires Scramble Pad). Scramble Pad shall display time remaining on the minute, and annunciate at the defined "Warning Time"
d. Special Needs Time Extension to provide additional time for Momentary Access and Door Open Too Long for selected people.
e. Unlock/Re-lock of door by CODE, card or Time Zone
f. Door status monitoring shall allow for: door forced monitoring; door-open-too-long monitoring; door-open-too-long while door is unlocked; auto-re-lock of door when opened or closed
g. Request-to-exit masks alarm and/or unlocks door
h. 2-person requirement by door. A user can be defined as Normal, A/B Rule A, A/B Rule B, Executive Override. Can be disabled by Time Zone.
i. 63 Passback Zones. Can be disabled by Time Zone. A User can designate with Passback Executive Override.
j. Use Count limits on users
k. Absentee Rule limits on users
l. Temporary Day limits on users
m. Occupancy Counting / Minimum & Maximum limits per Passback Zone
n. Deadman CODE / Timer
o. Threat Levels – 99 Levels may be defined. Based on the Level in effect for the facility, selected readers may be disabled, dual readers in Card/Code Only during Time Zone can require dual, and selected User's Credentials can be disabled.

3. The controller shall include the following alarm management features at a minimum.

a. Momentarily mask alarm by CODE and/or card
b. Mask/unmask alarm by CODE and/or card or by Time Zone
c. Alarm device supervised while masked
d. Tamper switch on alarm device monitored while masked
e. Tamper Input may be configured to operate as a "Latch Monitor" with the appropriate door lock hardware.
f. Entry/Exit delay per alarm input
g. Alarm input triggers relay/s

4. The controller shall include the following relay control features at a minimum.

    a. CODE and/or card, input, or other relay triggers relay/s
    b. Trigger relay/s by time zone
    c. Relay may be normally de-energized or energized
    d. Disable relay/s during time zone
    e. Clear relay at end of time zone

B. Acceptable Manufacturers

1. Hirsch Identiv Velocity Firmware.
2. Approved Equal

PART 3 EXECUTION

3.1 INSTALLATION

A. All system programming shall be done at the Trade Contractor's facility prior to installation on site.
B. Qualified personnel shall install the System in strict compliance with manufacturer's instructions.
C. Wiring shall be color coded, uniform and in accordance with national electric codes and manufacturer's instructions.
D. Equipment shall be firmly secured, plumb and level.
E. All cable runs to the main equipment rack shall be tagged and identified.
F. Coordinate all work with Construction Manager – Advisor and other Trades Contractors.
G. Grounding of devices and peripheral equipment shall be installed per manufacturer's direction to eliminate noise induction and achieve optimum system performance.
H. Install and configure Security local area network as required for control and communication between system devices. When required, provide necessary coordination, termination, and programming associated with integrating Security local area network with facility network.
I. Equipment cabinets shall be assembled in the Trade Contractor's shop prior to delivery to the job site.

3.2 SOFTWARE SUPPORT

A. Refer to Section 284620 for software support and programming requirements.

3.3 SYSTEM INITIALIZING AND PROGRAMMING

A. All programming shall occur in the Trade Contractor's shop prior to installation on site.
B. The System shall be turned on and adjustment made to meet requirements of the specification and on-site conditions.
C. The System shall be programmed to function as specified.
D. Any special programming shall be documented and a written copy given to the Owner.
E. Coordinate integration of other electronic systems as called for in the contract documents.

3.4 SYSTEM TEST PROCEDURES

A. The System shall be pre-tested by the Security Equipment Trade Contractor and certified, in writing, to function in accordance with the plans and specification.
B. The Trade Contractor is to verify the system is communicating with all controlled devices.
C. Testing to be performed in the Trade Contractors shop prior to delivery-

1. Test 120VAC power equipment and hardware internal to all equipment racks. Test all conductors for shorts, opens, and polarity.
2. Fully charge all UPS systems. Test unit by removing power thereby causing the unit to switch to battery reserve.
3. Utilizing a test jig, simulate the operation of every circuit required.

D. Testing to be performed at the job site prior to powering the system

1. Test all 120VAC power sources for correct polarity and voltage. Test grounding system for continuity. Notify Electrical Trade Contractor of any problems.
2. The System shall be completely tested to assure that all components are hooked up and in working order. Motion detectors are to be aligned allowing for optimal pickup area. Locking devices are to be adjusted so that doors lock and unlock without interference. Correct all causes of such defects. If the cause is outside of the scope of the 281300 series scope of work, promptly notify the Architect Engineer in writing, indicating the cause of the defect and suggested corrective procedures.

E. Additional job site testing

1. After installation of head end electronics, verify proper operation of all field devices including locks, door position switches, card readers, push buttons, and intercom stations.
2. Verify proper integration between access control system and

a. PLC/GUI system
b. Video Surveillance system
c. Intercom/Paging system
d. Overhead door controls
e. Handicap assist door operators

F. The System shall be completely tested to assure that all components are hooked up and in working order. Inspect system for defects. Correct all causes of such defects. If the cause is outside of the scope of the Division 28 series scope of work, promptly notify the Architect Enginerr and Construction Manager - Advisor in writing, indicating the cause of the defect and suggested corrective procedures.
G. The system shall be capable of operating under normal operating conditions.
H. Provide written documentation showing all test results.
I. The System shall be final tested in the presence of the Architect Engineer. Trade Contractor is to provide all required testing equipment.

3.5 FIELD QUALITY CONTROL

A. Provide services of a duly factory authorized service representative for this project location to supervise the field assembly and connection of components and the pre-testing, testing, and adjustment of the system.
B. Make observations to verify that units and controls are properly labeled, and interconnecting wires and terminals are identified. Provide a list of final tap settings of paging speaker line matching transformers.

C. Rectify deficiencies indicated by tests and completely re-test work affected by such deficiencies at Trade Contractor's expense. Verify by the system test that the total system meets the Specifications and complies with applicable standards.

3.6 TRAINING

A. Provide the facility personnel with training in the use and maintenance of the entire access control system. Coordinate the training session with the Owner. Completed classroom sessions shall be documented by the Trade Contractor, certified by the attending Owner representative, and approved by the Acrhitect Engineer. Instruction shall take place during normal working hours (Monday through Friday, 8:00 a.m. to 5:00 p.m.). Instruction shall not begin until all systems are operational as designed.

B. The training sessions shall cover the operation and the maintenance manuals and the control console operators manuals and service manuals in detail, stressing all important operational and service diagnostic information necessary for the maintenance and operations personnel to efficiently use and maintain the control system.

C. Trade Contractor is responsible for providing operational and maintenance training applicable to the entire control system. Training is to include, but not be limited to the following-

1. Review all O+M manuals with Owner representatives present for training.
2. Perform a tour of the entire facility. During the tour the trainer shall point out all control equipment and provide a brief description of its purpose and use. This is to include but not be limited to control panels (graphic and pushbutton), all control system hardware, and devices controlled.

END OF SECTION

SECTION 282313 - VIDEO SURVEILLANCE FOR ELECTRONIC SECURITY

PART 1 - GENERAL

1.1 SYSTEM DESCRIPTION

A. Visual surveillance of the facility via cameras as indicated on the plans.

B. Video monitoring of all cameras on VMS workstations and displays at locations identified on the plans.

C. Review capabilities for the recorded images via the Video Management System.

D. Stored image transfer capabilities to allow archival functions and stored image transfer via removable media such as CD/DVD.

E. Cameras shall utilize Category 6 cable to transport video signal to the system.

F. Video surveillance system shall integrate with PLC/GUI Control system allowing for automatic camera call up upon manual input via touch screen icons, alarm or event activation. Alarms such as panic device activation or events such as intercom call acknowledge. When an alarm is activated, the nearest camera shall be displayed on the control station VMS displays automatically.

G. All IP cameras, recording devices, viewing stations, and controllers shall reside on a private dedicated Video Surveillance Ethernet Network included by the security electronics contactor as part of the system.

H. Provide all software and licensing as required.

I. Camera system to provide masking capability. Typical masking to include toilet/shower areas in detention areas, as well as other areas requested by Owner during final system testing.

J. Recording parameters and storage capacity

1. Servers and Mass storage devices are specified below. Provide a quantity of servers and storage devices necessary to accommodate the number of cameras indicated on the floor plans based on the camera specifications, and the following recording parameters:

    a. 7 IPS per camera
    b. Record based on motion
    c. Calculate motion based on 50% motion factor
    d. Minimum stored image retention of 45 days
    e. 30 IPS per camera when in alarm condition

2. If the installed system fails to provide the minimum 45 days of storage image retention for each camera; the integrator shall increase the storage array capacity until the 45 day requirement is met at no additional cost to the owner.

PART 2 - PRODUCTS

2.1 GENERAL

A. Equipment specified is intended as a reference standard for level of quality.

B. Substitutions of equal quality will be accepted for ONLY those products which state "Approved Equal" under the Acceptable Manufacturers list. Those "Approved Equal" items must comply with the requirements for "Comparable Products" as outlined in Section 01 60 00 PRODUCT REQUIREMENTS.

C. Provide materials listed by UL or ETL.

2.2 CORNER MOUNT CAMERA

A. Specifications

1.	Imaging Device	1 / 2.8" Exmor CMOS
2.	Max Resolution	1920 x 1080
3.	Shutter Speed	1/10000 – 1/60 (slow shutter 1/15, 1/8, ¼)
4.	Angle of View	120 degrees(H) – 70 degrees(V)
5.	Lens	Fixed 2.6mm, F2.0
6.	Input Voltage	24 VAC, 12 VDC POE IEEE 802.3af Class 0
7.	Power Consumption	24 VAC / 12VDC 500mA 6.0W PoE 48 VDC 125mA 6W
8.	Ethernet	RJ-45 10BASE-T/100BASE-TX
9.	Radio Frequency	FCC, CE
10.	Operating Temp	0 degrees celcius – 50 degrees celcius
11.	Humidity	0 – 80% (non-condensing)
12.	External Dimension	15" x 12.6"
13.	Weight	1600g

B. Acceptable Manufacturers

1. Vicon XX247-10-01 V-CELL HD Corner Mount Camera
2. Vicon

2.3 FIXED VIDEO SURVEILLANCE CAMERA 0.3 MP

A. Specifications

1.	Imaging Device:	1/2.8-inch CMOS sensor
2.	Max. Resolution:	SD (D1)
3.	Shutter Speed:	¼ - 1/20,000
4.	Automatic Gain Control:	On/Off selectable
5.	Signal-to-Noise Ratio:	>50 dB
6.	Sensitivity:	VGA: Color: 0.12 fc (1.25 lux); B&W: 0.014 fc (0.15 lux),slow shutter On, @f/1.6, 30 IRE

720P/1080P: Color: 0.07 fc (0.7 lux);

B&W: 0.007 fc (0.08 lux),slow shutter On, @f/1.4, 50 IRE

7. Zoom and Focus: Motorized focus and Zoom
8. Slow Shutter: 2X
9. Electronic Zoom: 1 ~ 10X (client software)
10. Lens Adjustment: Focus and zoom adjustment; fixed lens, DC iris/P-iris motorized lens, iris automatically adjusts to zoom condition
11. Focal Length: 3-9 mm (3X zoom)
12. Horizontal Field of View: 3-9 mm: 93°- 31.7°
13. Input Voltage: 24 VAC, 12 VDC, PoE
14. Current (MFZ On/Off): 24 VAC: 590 mA
    12 VDC: 550 mA

    PoE: Class 2
15. Power Consumption (MFZ Off/On): 12 VDC: 6.5 W, 24VAC: 7.5W, POE: 6.4W
16. Connectors: Power: 24 VAC/12 VDC screw terminal
    PoE/Network: RJ-45

    Video/Data: RJ-45
    Alarm In/Out: terminal block
    Audio In /Out: jack (audio out requires external amplifier)
    Slot for SD card
    Composite output provided for installation (NTSC/PAL selectable)
17. Radio Frequency

    Emission Rating: FCC Class A; CE
18. Operating Temperature: -40° to 122°F (-40° to 50°C)
19. Humidity: <90% relative, non-condensing
20. Construction: Plastic Dome: clear polycarbonate tamperproof screws, die-cast aluminum base
21. Dimensions: Height: 4.3 in. (110 mm), Diameter: 6.06 in. (154 mm)
    Dome Diameter: 4.3 in. (110 mm)
22. Weight: Approximately 2.5 lb (1.1 kg)

B. Acceptable Manufacturers

1. Vicon V920D-39MD-IP, typical of interior and exterior cameras. Provide required mounting supports and hardware. Provide quantity shown on plans. Provide software license as required.
2. Vicon

2.4 FIXED VIDEO SURVEILLANCE CAMERA 1.3 MP

A. Specifications

1.	Imaging Device:	1/2.8-inch CMOS sensor
2.	Max. Resolution:	720p
3.	Shutter Speed:	¼ - 1/20,000
4.	Signal-to-Noise Ratio:	>50 dB
5.	Tilt and Horizontal Adjustment:	3-axis adjustment: pan (360°), tilt (90°) and roll (lens may be rotated on its axis 360°)
6.	Electronic Zoom:	1 ~ 10X (client software)
7.	Lens Adjustment:	Focus and zoom adjustment; fixed lens, DC iris/P-iris motorized lens, iris automatically adjusts to zoom condition
8.	Focal Length:	3-9 mm
9.	Horizontal Field of View:	3-9 mm: 93°- 31.7°
10.	Input Voltage:	24 VAC, 12 VDC or PoE
11.	Current (MFZ On/Off):	24 VAC: 590 mA 12 VDC: 550 mA PoE: Class 2
12.	Power Consumption (MFZ Off/On):	12 VDC: 6.5 W, 24VAC: 7.5W, POE: 6.4W
13.	Connectors:	Power: 24 VAC/12 VDC screw terminal PoE/Network: RJ-45 Video/Data: RJ-45 Alarm In/Out: terminal block Audio In /Out: jack (audio out requires external amplifier) Slot for SD card Composite output provided for installation (NTSC/PAL selectable)
14.	Radio Frequency	
	Emission Rating:	FCC Class A; CE
15.	Operating Temperature:	-40° to 122°F (-40° to 50°C)
16.	Humidity:	<90% relative, non-condensing
17.	Construction:	Plastic Dome: clear polycarbonate tamperproof screws, die-cast aluminum base
18.	Dimensions:	Height: 4.3 in. (110 mm), Diameter: 6.06 in. (154 mm) Dome Diameter: 4.3 in. (110 mm)
19.	Weight:	Approximately 2.5 lb (1.1 kg)

B. Acceptable Manufacturers

1. Vicon V921D-39MD-IP, typical of interior cameras. Provide required mounting supports and hardware. Provide quantity shown on plans. Provide software license as required.
2. Vicon

2.5 MONITOR

A. Specifications

1.	LCD Panel:	LED
2.	Screen Size:	24”
3.	Pixel Pitch:	.248” x .248”
4.	Resolution:	1920x1080 pixels
5.	Aspect Ratio:	16:9
6.	Display Colors:	16.7 million colors
7.	Response Times:	5 ms
8.	Backlight:	LED
9.	Luminance:	250 cd/m²
10.	Contrast:	1000:1
11.	Viewing angle:	170 deg/160 deg
12.	Digital Input:	DVI-D, HDMI, VGA

B. Acceptable Manufacturer

1. Vicon VM-6215 LED-1
2. Approved Equal

2.5 MONITOR MOUTING ARM

A. Specifications

1. Accommodates CCTV Monitor size.
2. Accommodates CCTV Monitor weight.
3. Extends 16” (minimum)
4. Equipped with +/- 15 degree (minimum) tilt capabilities.

B. Acceptable Manufacturers

1. CorLiving A-202-MLM
2. Approved Equal

2.6 VIDEO MANAGEMENT SYSTEM

A. Specifications

1. Enterprise-Class Client/Server based video management system.
2. System-wide user management, alarm handling, health monitoring, and configuration.
3. Full virtual matrix capabilities, including analog monitor support and CCTV keyboard control

4. Superior alarm handling with alarm priorities and selectable user group distribution.
5. Provide load balanced storage across multiple arrays with recording failover in the event of an array malfunction.
6. Workstations must be capable of displaying live video independent of management server in the event the management server is unavailable.
7. Advances user interface concepts for effective and efficient operation
8. Supports all ONVIF Profile S devices,H.264, MPEG-4 encoders, decoders, IP cameras, IP auto domes.
9. Enterprise support for multiple management servers.
10. Video decoder support.
11. Support for camera call up. No scripting shall be required for interfacing between the VMS and PLC system.
12. VMS must have capability to monitor all network devices using SNMP.
13. Software Maintenance Agreements shall not be *required* by the manufacturer but rather offered.
14. Minimum Client Workstation PC Requirements
    a. HP Z420 Series
15. Minimum Central Server PC Requirements
    a. HP R8 Series

B. Acceptable Manufacturer

1. Vicon Viconnet Version 7. Provide expansion modules as required for support of viewing stations identified on plans, as well as modules required for video recording, system configuration and management, and system monitoring. Provide software license as required. Provide Software Maintenance as required.
2. Vicon

2.7 VIDEO MANAGEMENT SERVER

A. Specifications

1. 1RU Rack Mount
2. Windows Server 2012 standard, 64 bit OS
3. Intel Xeon E5-2603 Processor 1.8 GHz 4C 10M 6.4GT Hyper T 80 Watt
4. 16 GB 1RX4 RDIMM DDR3 1600
5. (4) 1TB 3.5” SATA enterprise hard drive 7.2K, 6 GB/s Hot Swap
6. Slim SATA DVD Optical
7. Mouse
8. Keyboard
9. Single monitor video card
10. Intel Pro/1000 PT Dual Port 1GB Ethernet Adapter
11. Dual 800 Watt Redundant PS
12. 3 Year onsite service

B. Acceptable Manufactures

1. Lenovo Thinkserver RD530
2. HP
3. Dell
4. Vicon

2.8 VIDEO STORAGE ARRAY

A. Specifications

1. The IP Video Storage System shall be an embedded, all-in-one IP Video Storage subsystem that provides “plug-and-play” iSCSI-based recording and management.
2. The IP Video Storage Array shall be a 2 U rack-mount chassis with eight (9) hot swappable, 3 Gbps SATA-II hard disk drives with RAID-5 protection..
3. The IP Video Storage Array shall be equipped with two (2) redundant 1 GbE network interfaces.
4. The IP Video Storage System shall contain a Disk-on-Module (DoM) solid-state memory module that contains a non-volatile backup image of all system software which can be used to initiate a full system recovery in the event the system partition is lost or corrupted.
5. The IP Video Storage Array shall be installed with the Microsoft Windows Storage Server 2012 operating system.
6. The IP Video Storage Array shall support the following:
   a. SNMP
   b. Remote Desktop
   c. HTTP monitoring
7. The IP Video Storage Array processor shall include ECC Unbuffered memory protection.
8. The storage array is designed so that all data is protected even if one hard disk drive completely fails.
9. Each 2TB disk drive in the storage array is hot swappable, so that a failed drive can be easily replaced without cycling power or interrupting recording or data retrieval.

B. Acceptable Manufacturer

1. Vicon NVR-Shadow digital video storage array. Provide a quantity of digital storage arrays to support the number of cameras shown on the plans.
2. Vicon

2.9 SECURITY NETWORK SWITCH

A. Specifications

1. (24) Ethernet 10/100/1000 ports, (4) shared SFB/GBIC 1000ports
2. Switching fabric: 68 Gbps
3. Forwarding rate: 50 mpps
4. Memory: 64 MB DRAM & 32 MB flash
5. MAC addresses: Up to 10,000
6. IGMP groups/Multicast routes: Up to 255
7. Configurable MTU: 10000 Bytes with jumbo frames
8. 1000BaseT ports: RJ-45 connectors
9. Stacking: Minimum 16 switches
10. Stacking Backplane: 10gbps
11. Input power: 100 – 240 VAC auto-ranging
12. Indicators:
    a. Port link integrity
    b. Port disabled
    c. Port speed
    d. Port full duplex

e. System status
f. System RPS
g. System link status
h. System link duplex
i. System link speed

13.	Operating Temp:	0 to 50 degrees C
14.	Operating relative humidity:	10 – 85% non-condensing
15.	Power consumption:	40 Watts max (120VAC)
16.	Certifications:	UL listed, FCC part 15 Class A
17.	POE: simultaneously	IEEE 802.3af on all ports

B. Acceptable Manufacturers

1. IFS NS3601-24P/4S
2. Cisco
3. HP

PART 3 COMPLETION

3.6 INSTALLATION

A. All system programming shall be done at the Trade Contractor's facility prior to installation on site.

B. Qualified personnel shall install the System in strict compliance with manufacturer's instructions.

C. Wiring shall be color coded, uniform and in accordance with national electric codes and manufacturer's instructions.

D. Equipment shall be firmly secured, plumb and level.

E. All cable runs to the main equipment rack shall be tagged and identified.

F. Coordinate all work with General Contractor other Trades Contractors.

G. Grounding of cables and peripheral equipment shall be installed per manufacturer's direction to eliminate noise induction and achieve optimum system performance.

H. Install and configure Security local area network as required for control and communication between system devices. When required, provide necessary coordination, termination, and programming associated with integrating Security local area network with facility administrative network.

I. Equipment cabinets shall be assembled in the Security Electronics Contractor's shop prior to delivery to the job site.

J. Cameras shall be aimed and focused in the presence and at the direction of the Owner.

3.7 SOFTWARE SUPPORT

A. Refer to Section 284620 for software support and programming requirements.

3.8 SYSTEM INITIALIZING AND PROGRAMMING

A. All programming shall occur in the Security Electronics Contractor's shop prior to installation on site.

B. The System shall be turned on and adjustment made to meet requirements of the specification and on-site conditions.

C. The System shall be programmed to function as specified.

D. Any special programming shall be documented and a written copy given to the Owner/User.

E. Coordinate integration of other electronic systems as called for in the contract documents.

3.9 FINAL ADJUSMENTS

A. Before obtaining permission from the Owner to schedule the acceptance test, provide written certification to the Architect Engineer that the complete system has been calibrated, tested and is ready to begin the 14 day burn-in period and acceptance testing.

B. Acceptance tests

1. Conduct final acceptance test after a period of not less than 14 consecutive normal working days of trouble free operation, on the complete and operational video surveillance system to demonstrate that it is functioning in accordance with all requirements of this specification. During this burn-in period, the video surveillance system shall operate continuously for 24 hours per day. Demonstrate the correct operation of all monitored and controlled points as well as the operation and capabilities of all sequences during the acceptance test.
2. Should retesting be deemed necessary by the Architect Engineer due to malfunction or inappropriate construction methods, the Trade Contractor shall be fully responsible for additional cost incurred for retesting, including the Architect Engineer and Trade Contractor's time.
3. Final system acceptance shall be based upon the completion of the following items:

    a. Completion of the installation of all hardware items. Complete operation of the system, with no failures during the entire acceptance test period.
    b. Satisfactory completion of the as-builts, operating, and maintenance manuals.
    c. Satisfactory completion of all training programs.
    d. Upon final acceptance, the warranty period shall begin.

3.10 SYSTEM TEST PROCEDURES

A. The System shall be completely tested to assure that all components are hooked up and in working order. Inspect system for defects. Correct all causes of such defects. If the cause is outside of the scope of the Division 28 series scope of work, promptly notify the Architect Engineer in writing, indicating the cause of the defect and suggested corrective procedures.

B. The Security Electronics Contractor is to verify the system is communicating with all controlled devices.

C. Test 120VAC power equipment and hardware internal to all equipment racks. Test all conductors for shorts, opens, and polarity.

D. Verify operation of UPS power conditioning and backup. Test by removing utility power from system.

E. Verify all field wiring is free of defects prior to termination of head end electronics.

F. After termination of head end electronics, fully test operation of system including activation of field devices, alarm initiation from field devices.

G. Provide written documentation showing all test results.

H. The System shall be final tested in the presence of the Architect Engineer. Trade Contractor is to provide all required testing equipment.

3.11 TRAINING

A. Contractor is responsible for providing operational and maintenance training applicable to the entire control system. Training is to include, but not be limited to the following-

1. Review all O+M manuals with Owner representatives present for training.
2. Perform a tour of the entire facility. During the tour the trainer shall point out all surveillance equipment and provide a brief description of its purpose and use. This is to include but not be limited to cameras, monitors, control stations, recording devices, and devices controlled.

END OF SECTION 282313

SECTION 28 31 11 – DIGITAL, ADDRESSABLE FIRE-ALARM SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

A. General: Drawings and conditions of the contract, including but not limited to General Conditions, and the Special Conditions listed below, apply to work of this section.

1. Supplementary Instructions to Bidders.
2. Supplementary Conditions.
3. Summary of the Work.
4. Project Coordination.
5. Cutting and Patching.
6. Definitions and Standards.
7. Submittals.
8. Schedules and Reports.
9. Temporary Facilities.
10. Security Regulations.
11. Safety and Health
12. Products.
13. Project Closeout.

B. Related Requirements:

1. Division 7 Section “Security Joint Sealants” for requirements for and locations to receive security joint sealants.
2. Division 11 Section “Tamper-Proof Metal Fasteners” for requirements for and locations to receive security fasteners.

C. Scope of Work: This performance specification provides the minimum requirements for the Life Safety System for both the YDC and OTSC. The system shall include, but not limited to all equipment, materials, labor, documentation and services necessary to furnish and install a complete, operational system to include but not limited to the following functions:

1. Smoke and fire detection.
2. Sprinkler suppression system monitoring and control.
3. Computer with fireworks software to annunciate all system activity.
4. Interface of the two buildings system.

D. Project Representatives

1. All contacts with the New Youth Detention Center Building & OTSC building shall be directed to the Owner's Representative, hereafter referred to as the Owner:

E. Interpretation

1. No interpretations of the meaning of the bid documents will be made to any bidder orally. Each request for such interpretation shall be made to the engineer in writing, addressed to Sidhu Associates.

F. Manufacturer

1. The manufacturer of the system equipment shall be regularly involved in the design, manufacture, and distribution of all products specified in this document. These processes shall be monitored under a quality assurance program that meets the ISO 9000 requirements.
2. All System components shall be the cataloged products of a single supplier. All products shall be listed by the manufacturer for their intended purpose.
3. Edwards Systems Technology, Inc. products constitute the minimum type and quality of equipment to be installed.
4. All control panel assemblies and connected field appliances shall be both designed and manufactured by the same company, and shall be tested and cross-listed as to ensure that a fully functioning is designed and installed. The system supplied under this specification shall be a microprocessor-based, system. The system shall utilize independently addressed, microprocessor-based smoke detectors, heat detectors, and modules as described in this specification.

G. Alternates

1. Strict conformance to this specification is required to ensure that the installed and programmed system will function as designed, and will accommodate the future requirements and operations of the building owner. All specified operational features must be met without exception.
2. The authorized representative of the manufacturer of the major equipment shall be responsible for the satisfactory installation of the complete system.
3. All equipment and components shall be the manufacturer's current model. The materials, appliances, equipment and devices shall be tested and listed by a nationally recognized approvals agency for use as part of a protected premises protective signaling system, access control, and smoke control. The authorized representative of the manufacturer of the major equipment, such as control panels, shall be responsible for the satisfactory installation of the complete system.
4. All control panel assemblies and connected field appliances shall be provided by the same system supplier, and shall be designed and tested to ensure that the system operates as specified. The system shall utilize independently addressed, microprocessor-based smoke detectors, heat detectors, as described in this specification.
5. All equipment and components shall be installed in strict compliance with the manufacturer's recommendations.
6. The equipment to be supplied will be considered only if it meets all sections of the performance specification. Any deviations of system performance outlined in this specification will only be considered when the following requirements have been met:
7. A complete description of proposed alternate system performance methods with three (3) copies of working drawings thereof for approval by the Owner, not less than ten (10) calendar days prior to the scheduled date for submission of bids.
8. The supplier shall furnish evidence that the proposed or alternate system performance is equal or superior to the system operation stated in the specification. Such evidence shall be submitted to and accepted by the Owner,

not less than ten (10) calendar days prior to the scheduled date for submission of bids.

9. The supplier shall submit a point-by-point statement of compliance for all sections in this specification. The statement of compliance shall consist of a list of all paragraphs within these sections. Where the proposed system complies fully with the paragraph as written, placing the word "comply" opposite the paragraph number shall indicate such. Where the proposed system does not comply with the paragraph as written, and the supplier feels the proposed system will accomplish the intent of the paragraph, a full description of the function as well as a full narrative description of how its proposal will meet its intent shall be provided. Any submission that does not include a point by point statement of compliance as described herein shall be disqualified. Where a full description is not provided, it shall be assumed that the proposed system does not comply.
10. The acceptability of any alternate proposed system shall be the sole decision of the Owner or his authorized representative.

1.2 REFERENCES

A. General

1. General (references): All work and materials shall conform to all applicable Federal, State and local codes and regulations governing the installation. If there is a conflict between the referenced standards, federal, state or local codes, and this specification, it is the bidder's responsibility to immediately bring the conflict to the attention of the Engineer for resolution. National standards shall prevail unless local codes are more stringent. The bidder shall not attempt to resolve conflicts directly with the local authorities unless specifically authorized by the Engineer.
2. System components proposed in this specification shall be ULI listed to operate together as a system. The supplier shall provide evidence, with his submittal, of listings of all proposed equipment and combinations of equipment. The supplier shall be responsible for filing of all documents, paying all fees (including, but not limited to plan checking and permit) and securing all permits, inspections and approvals. Upon receipt of approved drawings from the authority having jurisdiction, the supplier shall immediately forward two sets of drawings to the Owner. These drawings shall either be stamped approved or a copy of the letter stating approval shall be included.

B. Codes:

1. Fire The equipment and installation shall comply with the current provisions of the following codes and standards:

NFPA 70 - National Electric Code®
NFPA 72 - National Fire Alarm Code®
NFPA 90A - Air Conditioning Systems
NFPA 101- Life Safety Code®
IBC 2006
UL 864 - Control Units for Fire Protective Signaling Systems.
UL 268 - Smoke Detectors for Fire Protective Signaling Systems.
UL 268A - Smoke Detectors for Duct Applications.
UL 521 - Heat Detectors for Fire Protective Signaling Systems.
UL 228 - Door Closers-Holders, With or Without Integral Smoke Detectors.
UL 464 - Audible Signaling Appliances.
UL 38 - Manually Actuated Signaling Boxes for Use with Fire-Protective Signaling

Systems
UL 346 - Waterflow Indicators for Fire Protective Signaling Systems.
UL 1971 - Signaling Devices for the Hearing-Impaired.
UL 1481 - Power Supplies for Fire Protective Signaling Systems.
Factory Mutual (FM) approval
Baltimore City Fire Marshal.

Federal Codes and Regulations
Americans with Disabilities Act (ADA)
International Standards Organization (ISO)
ISO-9000
ISO-9001

1.3 SYSTEM DESCRIPTION

A. General

1. The Contractor shall furnish all labor, services and materials necessary to furnish and install a complete, functional fire alarm system (System) for both the YDC & OTSC buildings. The System shall comply in respects with all pertinent codes, rules, regulations and laws of the Authority, and local jurisdiction. The System shall comply in all respects with the requirements of the specifications, manufacturer's recommendations and Underwriters Laboratories Inc. (ULI) listings. It is further intended that upon completion of this work, the Owner be provided with:
Complete information and drawings describing and depicting the entire system(s) as installed, including all information necessary for maintaining, troubleshooting, and/or expanding the system(s) at a future date.
Complete documentation of system(s) testing.
Certification that the entire system(s) has/have been inspected and tested, is/are installed entirely in accordance with the applicable codes, standards, manufacturer's recommendations and ULI listings, and is/are in proper working order. Contractor shall use "Fire Alarm System Certification and Description" as required by Section 1-6.2 of NFPA 72 - 1999 edition. Provide and install a workstation computer with Fireworks FW-CGS software to annunciate all system activity from both buildings fire alarm systems. Connect the computer via CAT5e cable back to the EST3x fire alarm panel. Utilize an Edwards MN-COM1S network module for connection to the EST3x panel. The software shall support textual annunciation of all system activity, no common control over the FACP is necessary.

2. Description 24VDC NACs
   a. Provide and install a new fire detection and alarm system that shall consist of:
   b. Two Fire Alarm Control Panels located as shown on the drawings.
   c. Two LCD remote annunciator(s) located as shown on the drawings.
   d. A printer.
   e. Manual pull stations located as shown on the drawings.
   f. Area smoke detectors located as shown on drawings.
   g. Area heat detectors located as shown on drawings.
   h. Beam smoke detectors located as shown on the drawings.
   i. Duct smoke detectors located as shown on the drawings.
   j. Sprinkler system waterflow(s) and valve supervisory switch(s) located as shown on the drawings.

k. Interface with suppression system(s) as shown on the drawings.
l. Provide audible notification appliances (chimes) located as shown on the drawings.
m. Provide synchronized visual notification appliances located as shown on the drawings.
n. Provide magnetic door holders, located as shown on drawings.
o. Provide elevator recall functions for primary and alternate floors and elevator power shunt trip activation.
p. Provide connection to a central station. The owner shall arrange for two dedicated phone lines to be terminated as directed by the installing contractor.
q. Provide wire guards where shown on the drawings.

B. Sequence of Operations

1. General 24 VDC NACs

a. The alarm activation of any area smoke detector, heat detector, manual pull station, sprinkler water flow, the following functions shall automatically occur:
b. The internal audible device shall sound at the control panel and remote annunciator.
c. The LCD display shall indicate all applicable information associated with the alarm condition including; device type, device location and time/date.
d. All system activity/events shall be documented in system history and on the system printer.
e. Any remote or local annunciator LCD/LED's associated with the alarm shall be illuminated.
f. Activate notification audible appliances throughout the building.
g. Activate visual strobes notification appliances throughout the building. The visual strobe shall continue to flash until the system has been reset. The visual strobe shall not stop operating when the "Alarm Silence" is pressed.
h. Transmit an alarm signal to the central station.
i. All automatic events programmed to the alarm point shall be executed and the associated outputs activated.
j. All stairwell/exit doors shall unlock throughout the building.
k. All self-closing fire/smoke doors held open shall be released.

C. Duct Smoke Operation

1. The Alarm activation of any duct smoke detector, the following functions shall automatically occur:

a. The internal audible device shall sound at the control panel and remote annunciator.
b. The LCD display shall indicate all applicable information associated with the supervisory condition including; device type, device location and time/date.
c. All system activity/events shall be recorded on the system printer and system history file.
d. Any remote or local annunciator LED's associated with the supervisory shall be illuminated.
e. Transmit signals to remote annunciators .

f. Transmit an alarm signal to the central station.
g. Shutdown the local air handling unit.
h. All automatic events programmed to the alarm point shall be executed and the associated outputs activated.

D. Supervisory Operation

1. Upon supervisory activation of any sprinkler valve supervisory switch, the following functions shall automatically occur:

a. The internal audible device shall sound at the control panel and remote annunciator.
b. The LCD display shall indicate all applicable information associated with the supervisory condition including; device type, device location and time/date.
c. All system activity/events shall be documented on the system printer and system history file.
d. Any remote or local annunciator LCD/LED's associated with the supervisory activation shall be illuminated.
e. Transmit a supervisory signal to the central station.

E. Trouble Operation

1. Upon activation of a trouble condition or signal from any device on the system, the following functions shall automatically occur:

a. The internal audible device shall sound at the control panel and remote annunciator.
b. The LCD display shall indicate all applicable information associated with the trouble condition including; device type, device location and time/date.
c. All system activity/events shall be documented on the system printer and system history file.
d. Any remote or local annunciator LCD/LED's associated with the trouble zone shall be illuminated.
e. Transmit a trouble signal to the central station.

F. System Configuration

1. All Life Safety System equipment shall be arranged and programmed to provide a system for the early detection of fire, the notification of building occupants, the automatic summoning of the local fire department, the override of the HVAC system operation, and the activation of other auxiliary systems to inhibit the spread of smoke and fire, and to facilitate the safe evacuation of building occupants.
2. The System shall utilize independently addressed, smoke detectors, heat detectors and input/output modules as described elsewhere in this specification.

G. Power Supply

1. The power supply shall be a high efficiency switch mode type with line monitoring to automatically switch to batteries for power failure or brown out conditions. The automatic battery charger shall have low battery discharge protection. The

power supply shall provide internal power and 24 Vdc at 4.5A continuous for notification appliance circuits. <Auxiliary power shall be 24 Vdc at 1A.><Smoke power shall be 24vdc at 500mA> All outputs shall be power limited. The battery shall be sized to support the system for <60> <24> <4> hours of supervisory and trouble signal current plus general alarm for <5> <15> <30> minutes. The power supply shall be an EST model 2-PPS.

2. Auxiliary power supplies shall be a high efficiency switch mode type with line monitoring to automatically switch to batteries for power failure or brown out conditions. The automatic battery charger shall have low battery discharge protection. The power supply shall provide internal power and 24 Vdc at 6.4 continuous for notification appliance circuits. The power supply shall be capable of providing 8A to output circuits for a maximum period of 100 ms. All outputs shall be power limited. The battery shall be sized to support the system for <60> <24> <4> hours of supervisory and trouble signal current plus general alarm for <5> <15> <30> minutes. All supervision of the auxiliary supply shall be transmitted via addressable analog loop without additional equipment. The auxiliary power supply shall be an EST model SIGA-APS.

H. Display

1. The display module shall be of membrane style construction with a 4 line by 20 character Liquid Crystal Display. The LCD shall use super-twist technology and backlighting for high contrast visual clarity. In the normal mode display the time, the total number of active events and the total number of disable points. In the alarm mode display the total number of events and the type of event on display. Reserve 40 characters of display space for user custom messages. The module shall have visual indicators for the following common control functions; AC Power, alarm, supervisory, monitor, trouble, disable, ground fault, CPU fail, and test. There shall be common control keys and visual indicators for; reset, alarm silence, trouble silence, drill, and one custom programmable key/indicator. Provide four pairs of display control keys for selection of event display by type (alarm, supervisory, monitor and trouble) and forward / backward scrolling through event listings. The operation of these keys shall be integrated with the related common control indicator that lights when an event of its type is active. Allow the first event of the highest priority to capture the LCD for display so that arriving fire fighters can view the first alarm event "hands free". Provide system function keys; status, reports, enables, disable, activate, restore, program, and test. The module shall have a numeric keypad, zero through nine with delete and enter keys.
   The display module shall be an EST model 2-LCD.

I. Initiating Device Circuits

1. The Initiating device circuits (IDC) used to monitor manual fire alarm stations, smoke and heat detectors, water flow switches, valve supervisory switches, fire pump functions, and air pressure supervisory switches shall be Class B.
   The Initiating device circuits shall be EST Signature series modules.

J. 24 VDC Notification Appliance Circuits

1. 24 VDC Notification appliance circuits (NAC) shall be Class B (Style "Y"). All notification appliance circuits shall have a minimum circuit output rating of 2 amp

@ 24 vdc. The notification circuits shall be power limited. Non-power limited circuits are not acceptable.
The 24 VDC Notification appliance circuits shall be EST Signature series modules.

K. Signaling Line Circuits
1. The signaling line circuit shall communicate from a panel/node to analog/addressable detectors, input modules, output modules, isolation modules and notification appliance circuits.
2. Each signaling circuit connected to addressable/analog devices shall provide a minimum of 20 spare addresses.
3. When a signaling line circuit covers more than one fire/smoke compartments, a wire-to-wire short shall not affect the operation of the circuit from the other fire/smoke compartments.
4. The signaling line circuit (SLC) connecting panels and annunciators shall be Class B (style 4).
5. The signaling line circuit connecting to addressable/analog devices including, detectors, monitor modules, control modules, isolation modules, and notification circuit modules shall be Class B (style 4).

1.4 MRc2: Construction Waste Management

A. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 018113 Sustainable Design Requirements.

B. EQc4.1: LOW-EMITTING MATERIALS – SEALANTS AND ADHESIVES

All sealants, adhesives, and sealant primers used on the interior of the building shall comply with the project requirements for Low-Emitting Materials – Sealants and Adhesives. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

C. EQc4.2: LOW-EMITTING MATERIALS – PAINTS AND COATINGS

All paints and coatings used in the building interior comply with the project requirements for Low-Emitting Materials – Paints and Coatings. See Section 018113 Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 013300 Submittal Procedures.

1.5 Submittals (YDC and OSTC)

A. Project Submittal

1. The contractor shall purchase no equipment for the system specified herein until the owner has approved the project submittals in their entirety and has returned them to the contractor. It is the responsibility of the contractor to meet the entire intent and functional performance detailed in these specifications. Approved submittals shall only allow the contractor to proceed with the installation and shall not be construed to mean that the contractor has satisfied the requirements of these specifications. The contractor shall submit three (3) complete sets of documentation within 30 calendar days after award of purchase order.
2. Each submittal shall include a cover letter providing a list of each variation that the submittal may have from the requirements of the contract documents. In addition the contractor shall provide specific notation on each shop drawing, sample, catalog cut, data sheet, installation manual, etc. submitted for review and approval, of each such variation.
3. All drawings and diagrams shall include the Contractor's title block, complete with drawing title, contractor's name, address, date including revisions, and preparer's and reviewers initials.

B. Product Data

1. Data sheets with the printed logo or trademark of the manufacturer for all equipment. Indicated in the documentation will be the type, size, rating, style, and catalog number for all items proposed to meet the system performance detailed in this specification. The proposed equipment shall be subject to the approval of the Architect/Engineer.

C. Shop Drawings (YDC and OSTC)

1. A complete set of shop drawings shall be supplied for both the YDC and OTSC. The shop drawings shall be reproduced electronically in digital format. Shop drawing shall also be submitted to Permits Department and to the State Fire protection engineer for their approval and all the fees shall be paid by contractor. Resubmit as required to make clarifications or revisions to obtain approval. This package shall include but not be limited to:

    a. Control panel wiring and interconnection schematics.
    b. Complete point to point wiring diagrams.

D. Riser diagrams (YDC and OSTC)

1. Complete floor plan drawing locating all system devices and 1/4' = 1'-0 scale plan and elevation of all equipment in the Fire Command Station. Including showing the placement of each individual item of fire alarm equipment as well as raceway size and routing, junction boxes, and conductor size, quantity, and color in each raceway.
2. Detailed system operational description. Any Specification differences and deviations shall be clearly noted and marked.

E. Complete system bill of material (YDC and OSTC

1. All drawings shall be reviewed and signed off by an individual having a minimum of a NICET certification in fire protection engineering technology, subfield of fire alarm systems.

F. Samples

1. A sample of each smoke detector, intelligent modules, horn, wire guards and strobes shall be provided to the contractor for their familiarization. Wire guard shall be reviewed by the owner for review and approval.

G. Quality Assurance/Control Submittals

1. Installer's NICET Certification
2. The engineered systems distributor must be licensed in the state of project location and have been incorporated in the business in that state for a minimum of 5 years.
3. Submit a copy of the contractors training certification issued by the manufacturer of the Life Safety System. A copy of the installing technician's NICET certification.

H. System Calculations (YDC and OSTC)

1. Complete calculations shall be provided which show the electrical load on the following system components:

a. Each system power supply, including stand alone booster supplies.
b. Each standby power supply (batteries).
c. Each notification appliance circuit.
d. Each auxiliary control circuit that draws power from any system power supply.

1.6 Software Service Agreement

A. Comply with UL 864.

B. Technical Support: beginning with Substantial Completion, provide software support for two years.

C. Upgrade Service: Update software to latest version at project completion. Install and program software upgrades that become available with two years from date of Substantial Completion. Upgrading software shall include operating system. Upgrade software shall include new or revised license for use of software.

D. Provide 30 days' notice to owner to allow scheduling and access to system and to allow owner to upgrade computer system if necessary.

1.7 Software and Firmware Operational Documentation:

A. Software operating and upgrade manuals.

B. Program Software Backup: On magnetic media or compact disk, complete with data files.

C. Device address list.

D. Printout of software application and graphics screen.

1.8 Project Conditions

A. Conditions

1. It shall be the Contractor's responsibility to inspect the job site and become familiar with the conditions under which the work will be performed. Inspection of the building may be made by appointment with the Owner. Contractors are requested to inspect the building prior to the pre-bid meeting.
2. A pre-bid meeting will be held to familiarize the Contractors with the project. Failure to attend the pre-bid meeting may be considered cause for rejection of the Contractor's bid. The minutes of this meeting will be distributed to all attendees and shall constitute an addendum to these specifications.

1.9 Warranty and Maintenance

A. Warranty

1. The contractor shall warranty all materials, installation and workmanship for two (2) year from date of acceptance, unless otherwise specified. A copy of the manufacturer's warranty shall be provided with close-out documentation and included with the operation and installation manuals.
2. The System Supplier shall maintain a service organization with adequate spare parts stock within 50 miles of the installation. Any defects that render the system inoperative shall be repaired within 24 hours of the owner notifying the contractor.

B. Spare Parts

1. The Contractor shall supply the following spare parts:

a. Automatic detection devices - Two (2) percent of the installed quantity of each type.
b. Manual fire alarm stations - Two (2) percent of the installed quantity of each type.
c. Glass rods or panels for break glass manual fire alarm stations (if used) - <Ten> percent of the installed quantity, but no less than two devices.
d. Audible and visible devices - One (1) percent of the installed quantity of each type, but no less than two (2) devices.
e. Keys - A minimum of three (3) sets of keys shall be provided and appropriately identified.

1.10 Training

A. Training: The System Supplier shall schedule and present a minimum of 8 hours supporting 3 shifts of owner reps with documented formalized instruction for the building owner, detailing the proper operation of the installed System.

B. The instruction shall be presented in an organized and professional manner by a person factory trained in the operation and maintenance of the equipment and who is also thoroughly familiar with the installation.

C. The instruction shall cover the schedule of maintenance required by NFPA 72 and any additional maintenance recommended by the system manufacturer.

D. Instruction shall be made available to the Local Municipal Fire Department if requested by the Local Authority Having Jurisdiction.

1.11 COMMISSIONING

A. The materials, components and systems described in this section are subject to the Commissioning process. Contractor must comply with all Commissioning Requirements. Commissioning Requirements are described in Section 019113 General Commissioning Requirements and in Division 36 Commissioning. Division 36 provides an individual Commissioning specification section for each Division 2 through Division 33 specification section requiring Commissioning.

PART 2 - PRODUCTS

2.1 Manufacturer

A. Acceptable fire alarm system manufacturers include:

1. Edwards Systems Technology, Inc.

a. All equipment and components shall be the manufacturer's current model equal to EST3X. The materials, appliances, equipment and devices shall be tested and listed by a nationally recognized approval agency for use as part of a protected premises protective signaling (fire alarm) system. The authorized representative of the manufacturer of the major equipment, such as control panels, shall be responsible for the satisfactory installation of the complete system.

b. The contractor shall provide, from the acceptable manufacturer's current product lines, equipment and components, which comply, with the requirements of these specifications. Equipment or components, which do not provide the performance and features, required by these specifications are not acceptable, regardless of manufacturer.

2.2 Panel Components & Functions

A. General

1. The control panels shall be a multi-processor-based system and shall be able to network between two fire alarm panels and designed specifically for fire and releasing system applications. The control panel shall be listed and approved for the application standard(s) as listed under the General section.

2. The control panel shall include all required hardware, software and system programming to provide a complete and operational system. The control panel shall assure that life safety takes precedence among all panel activities.
3. The control panel shall include the following capacities:
   a. Support up to 380 analog/addressable points per panel (1,900 total with 5 networked panels)
   b. Support up to 5 fully supervised network remote annunciators.
   c. Support a DACT (dialer) for off premise notification
   d. Support up to 576 chronological events in history.
   e. Network with other panels and workstation.
4. The control panel shall include the following features:
   a. Provide auto programming and electronic addressing and mapping of analog/addressable devices.
   b. Provide an operator interface display that shall include functions required for annunciation, command and control system functions.
   c. Provide a discreet system control switch provided for reset, alarm silence, local silence, drill switch, up/down switches, status switch, program switch, enable and disable switches, activate and restore switches, reports switch and test switch.
   d. Provide system reports that provide sensitivity and history details.
   e. Provide an authorized operator with the ability to operate or modify system functions like system time, date, passwords; and auto program, enable mapping, restart the system and clear control panel event history file.
   f. Provide an authorized operator to perform test functions within the installed system.
5. Supervision of system components, wiring, initiating devices and software shall be provided by the control panel. Failure or fault of system component or wiring shall be indicated by type and location on the LCD display. Software and processor operation shall be independently monitored for failure.

B. Annunciation
1. The system shall be designed and equipped to receive, monitor, and annunciate signals from devices and circuits installed throughout both YDC and OSTC building. Manufacturer's standard control switches shall be acceptable if they provide the required operation, including performance, supervision and position indication. If the manufacturers' standard switches do not comply with these requirements, fabrication of custom manual controls acceptable to the owner is required.
2. Receipt of alarm, trouble, and supervisory signals shall activate integral audible devices at the control panel(s) and at each remote annunciation device.
3. The annunciator shall contain the following system status indicators:
   a. 80 character Backlit Liquid Crystal Display.
   b. System Power Indicator - green LED.
   c. System Common Alarm - red LED.
   d. System Common Trouble - yellow LED.
   e. System Common Supervisory - yellow LED.
   f. System Common Monitor - yellow LED.
   g. System Ground Fault - yellow LED.
   h. System CPU Fault - yellow LED.
   i. System Disabled - yellow LED.
   j. System Test Point(s) - yellow LED.
   k. System Reset Switch with Integral yellow LED.
   l. System Alarm Silence Switch with Integral yellow LED.
   m. System Local Silence Switch with Integral yellow LED.

n. System Drill Switch with Integral yellow LED
o. System Message Queue Scroll Switches.
p. Additional buttons as required to provide system control and operator functions.
q. The networked annunciator(s) shall be an EST EST2 series.

C. Power Supply

1. Each system power supply shall be a minimum of 6 amps @ 24 vdc.
2. Upon failure of normal (AC) power, the affected portion(s) of the system shall automatically switch over to secondary power without losing any alarm, trouble or operator acknowledgment signals.
3. Each system power supply shall be individually annunicated and shall identify the inoperable power supply in the event of a trouble condition.
4. All standby batteries shall be continuously monitored by the system. Low battery and disconnection of battery power supply conditions shall immediately annunciate as a trouble signal, identifying the deficient batteries.
5. All system power supplies shall be capable of recharging their associated batteries, from a fully discharged condition to a capacity sufficient to allow the system to perform consistent with the requirements of this section, in 48 hours maximum.
6. All AC power connections shall be to the building's designated emergency electrical power circuit and shall meet the requirements of Section 1-5.2 of NFPA 72 - 1999. The AC power circuit shall be installed in conduit raceway. The power circuit disconnect means shall be clearly labeled FIRE ALARM CIRCUIT CONTROL and shall have a red marking. The location of the circuit disconnect shall be labeled permanently inside the each control panel.
7. The power supply shall be an EST model 2-PPS/6A.

D. Display

1. System Message Processing and Display Operations:

a. The system shall allow message routing to be configured to any or all annunciators.
b. All system printer port shall be configurable to output any combination of alarm, supervisory, trouble, or monitor, event messages.
c. Each LCD display on each annunciator shall be configurable to display the status of any combination of alarm, supervisory, trouble, or monitor, event messages.
d. Clear distinction shall be provided between alarm, supervisory, trouble, and monitor status messages.
e. The system shall provide the ability to retrieve data from the analog/addressable detectors to a PC while the system is on-line and operational in the protected premises. The uploaded data may then be analyzed in a diagnostic program supplied by the system manufacturer.
f. A standby power supply shall automatically supply electrical energy to the system upon primary power supply failure.

E. Dialer – Fiber Modem

Provide fiber modem for fire alarmpanel located in existing OSTC building for the connection to MTC.

F. Reports

1. The system shall provide the operator with system reports that give detailed chronological description of the last 576 system events. The system shall provide a report that gives a listing of the sensitivity and environmental compensation usage of all of the detectors on the system, or specified analog/addressable circuit.
2. The system report shall also include facility name, compiled date, compiler revision, project revision and report date. The system shall output these reports via the main LCD, and reports shall be capable of being printed on the system printer.

2.3 Field-mounted system components

A. Initiating Devices

1. Smoke Detectors & Accessories

a. Analog Addressable Smoke General
   1) Each analog addressable smoke detectors sensitivity shall be capable of being programmed individually as: most sensitive, more sensitive, normal, less sensitive or least sensitive.
   2) An alternate alarm sensitivity level shall be provided for each detector, which can be set to any of the five (5) sensitivity settings manually or automatically using a time of day event.
   3) The detector's sensing element reference point shall automatically adjust, compensating for background environmental conditions such as dust, temperature, and pressure. Periodically, the sensing element real-time analog value shall be compared against its reference value. The detector shall provide a maintenance alert signal that 80% to 99% compensation has been used. The detector shall provide a dirty fault signal that 100% compensation has been used.
   4) The system shall allow for changing of detector types for service replacement purposes without the need to reprogram the system. The replacement detector type shall automatically continue to operate with the same programmed sensitivity levels and functions as the detector it replaced. System shall display an off-normal condition until the proper detector type has been installed or change in the application program profile has been made.

b. Smoke Detector – Photoelectric
   1) Provide analog/addressable photoelectric smoke detectors at the locations shown on the drawings. The system shall have the ability to set the sensitivity and alarm verification of each of the individual detectors on the circuit. It shall be possible to automatically change the sensitivity of individual analog/addressable detectors for the day and night periods. Each smoke detector shall be capable of transmitting alarm signals as well as normal, trouble and need cleaning information. It shall be possible to program control panel activity to each level. Each smoke detector may be individually programmed to operate at any one of five (5) sensitivity settings. Each detector microprocessor shall contain an environmental

compensation algorithm that identifies and sets ambient environmental thresholds approximately six times an hour. The microprocessor shall monitor the environmental compensation value and alert the system operator when the detector approaches 80% and 100% of the allowable environmental compensation value.

2) The analog/addressable photoelectric smoke detector shall be an EST model SIGA-PS.

c. Duct Detector Housing

1) Provide smoke detector duct housing assemblies to mount an analog/addressable detector along with a standard, relay or isolator detector mounting base. The housing shall also protect the measuring chamber from damage and insects. The housing shall utilize an air exhaust tube and an air sampling inlet tube that extends into the duct air stream up to ten feet. Drilling templates and gaskets to facilitate locating and mounting the housing shall also be provided. The housing shall be finished in baked red enamel. Remote alarm LED indicators and remote test stations shall be provided.

2) The smoke detector duct housing shall be an EST model SIGA-SD.

B. Heat Detectors

1. Fixed Temperature-ROR Heat Detector

a. Provide analog/addressable combination fixed temperature / rate-of-rise detectors at the locations shown on the drawings. The heat detector shall have a nominal fixed temperature alarm point rating of 135°F (57°C) and a rate of rise alarm point of 15°F(9°C) per minute. The heat detector shall be rated for ceiling installation at a minimum of 70 ft (21.3m) centers and be suitable for wall mount applications.

b. The analog/addressable combination fixed temperature / rate-of-rise detector shall be EST model SIGA-HRS.

C. Detector Bases

1. Detector Base – Standard

a. Provide standard detector mounting bases suitable for mounting on either North American 1-gang, 3½ or 4 inch octagon box and 4 inch square box, or European BESA or 1-gang box. The base shall, contain no electronics and support all series detector types.

b. The standard detector base shall be an EST model SIGA-SB4.

D. Manual Stations

1. Provide Double-action mechanism requiring two actions to initiate an alarm, pull-lever type; with integral addressable module arranged to communicate manual-station status (normal, alarm, or trouble) to fire-alarm control unit. The manual station shall be suitable for mounting on North American 2 ½ (64mm) deep 1-gang boxes and 1 ½ (38mm) deep 4 square boxes with 1-gang covers. Manual station accessible to inmate shall be key Typed.

E. Notification Appliances

1. General (signals)

    a. All appliances which are supplied for the requirements of this specification shall be UL Listed for Fire Protective Service, and shall be capable of providing the "equivalent facilitation" which is allowed under the Americans with Disabilities Act Accessibilities Guidelines (ADA(AG)), and shall be UL 1971 Listed.
    b. All appliances shall be of the same manufacturer as the fire alarm control panel specified to insure absolute compatibility between the appliances and the control panels, and to insure that the application of the appliances are done in accordance with the single manufacturer's instructions.
    c. Any appliances that do not meet the above requirements, and are submitted for use must show written proof of their compatibility for the purpose intended. Such proof shall be in the form of documentation from all manufacturers that clearly states that their equipment (as submitted) is 100% compatible with each other for the purpose intended. All strobes shall be provided with lens markings oriented for wall mounting.
    d. All notification appliances shall be <red><white> unless noted otherwise on the drawings.

2. Chime

    a. Low Profile Chimes: Provide low profile wall mount chimes at the locations shown on the drawings. The chime shall provide a 79 dBA sound output at 10 ft. when measured in reverberation room per UL-464. The chime shall automatically pulse at 60 strokes per minute. In and out screw terminals shall be provided for wiring. The chime shall mount in a North American 1-gang box. The low profile wall mount chimes shall be EST Model G1-C Genesis series.

3. Chime-Strobes

    a. Low Profile Chime-Strobes: Provide low profile wall mount chime/strobes at the locations shown on the drawings. The chime/strobe shall provide an audible output of 79dBA at 10 ft. when measured in reverberation room per UL-464. Strobes shall provide synchronized flash outputs. The strobe output shall be determined as required by its specific location and application from a family of 15cd, 30cd, 60cd, 75cd & 110cd devices. In and out screw terminals shall be provided for wiring. Low profile chime/strobes shall mount in a North American 1-gang box.The low profile wall mount chime/strobes shall be EST G1-CVM Genesis series.

4. Low Profile Strobes

    a. Provide low profile wall mounted strobes at the locations shown on the drawings. In and out screw terminals shall be provided for wiring. Strobes shall provide synchronized flash outputs. Strobe output shall be determined as required by its specific location and application from a family of 15cd, 30cd, 60cd, 75cd, or 110cd devices. Low profile strobes shall mount in a North American 1-gang box.
    b. The low profile wall mounted strobes shall be EST Genesis series.

F. Initiation & Control Modules

1. Intelligent Modules – General

    a. It shall be possible to address each intelligent module without the use of DIP or rotary switches. Devices using DIP switches for addressing shall not be acceptable. The personality of multifunction modules shall be programmable at site to suit conditions and may be changed at any time using a personality code downloaded from the Analog Loop Controller. Modules requiring EPROM, PROM, ROM changes or DIP switch and/or jumper changes shall not be acceptable. The modules shall have a minimum of 2 diagnostic LEDs mounted behind a finished cover plate. A green LED shall flash to confirm communication with the loop controller. A red LED shall flash to display alarm status. The module shall be capable of storing up to 24 diagnostic codes which can be retrieved for troubleshooting assistance. Input and output circuit wiring shall be supervised for open and ground faults. The module shall be suitable for operation in the following environment:
        1) Temperature: 32°F to 120°F (0°C to 49°C)
        2) Humidity: 0-93% RH, non-condensing

2. Control Relay Module - SIGA-CR

    a. Provide intelligent control relay modules at the locations shown on the drawings. The Control Relay Module shall provide one form "C" dry relay contact rated at 2 amps @ 24 Vdc to control external appliances or equipment shutdown. The control relay shall be rated for pilot duty and releasing systems. The position of the relay contact shall be confirmed by the system firmware. The control relay module shall be suitable for mounting on North American 2 ½" (64mm) deep 1-gang boxes and 1 ½" (38mm) deep 4" square boxes with 1-gang covers.
    b. The addressable control relay circuit module shall be an EST model SIGA-CR.

3. Dual Input Module - SIGA-CT2

    a. Provide intelligent dual input modules at the locations shown on the drawings.. The Dual Input Module shall provide two (2) supervised Class B input circuits each capable of a minimum of 4 personalities, each with a distinct operation. The module shall be suitable for mounting on North American 2 ½" (64mm) deep 1-gang boxes and 1 ½" (38mm) deep 4" square boxes with 1-gang covers. The dual input module shall support the following circuit types:
        1) Normally-Open Alarm Latching (Manual Stations, Heat Detectors, etc.)
        2) Normally-Open Alarm Delayed Latching (Water flow Switches)
        3) Normally-Open Active Non-Latching (Monitor, Fans, Dampers, Doors, etc.)
        4) Normally-Open Active Latching (Supervisory, Tamper Switches
    b. The intelligent dual input module shall be an EST model SIGA-CT2.

4. Single Input Module - SIGA-CT1

    a. Provide intelligent single input modules at the locations shown on the drawings. The Single Input Module shall provide one (1) supervised Class

B input circuit capable of a minimum of 4 personalities, each with a distinct operation. The module shall be suitable for mounting on North American 2 ½" (64mm) deep 1-gang boxes and 1 ½" (38mm) deep 4" square boxes with 1-gang covers. The single input module shall support the following circuit types:

1) Normally-Open Alarm Latching (Manual Stations, Heat Detectors, etc.)
2) Normally-Open Alarm Delayed Latching (Water flow Switches)
3) Normally-Open Active Non-Latching (Monitor, Fans, Dampers, Doors, etc.)
4) Normally-Open Active Latching (Supervisory, Tamper Switches)

b. The intelligent single input module shall be an EST model SIGA-CT1.

2.4 Graphic Annunciators (YDC and OSTC)

A. Two graphics panel one for each bldg. are required, both located @ YDC lobby.

B. The annunciator graphical diagram shall be 18 x 18 inch per foot scale minimum and operating on nominal 24 Vdc. All annunciator switches shall be system input points and shall be capable of controlling any system output or function. The graphic annunciator shall be UL and ULC Listed. The graphic shall be back-lit using high intensity LEDs. The unit shall be surface mounted. The main graphic door shall be tamper resistant and equipped with a key lock. It shall be possible to update the graphic image in the field without replacing the entire graphic.

1. The graphic annunciator shall be an EST Envoy series.

2.5 Wire cage

A. Provide intuitional grade UL listed wire cage around horn, strobes and smoke detectors located in inmate areas. Wire cage shall be approved by the owner via a sample.

2.6 Workstation

A. Provide and install two workstation computers with Fireworks FW-CGS software to annunciate all system activity from both buildings fire alarm systems. Connect the computer via CAT5e cable back to the EST3x fire alarm panel. Utilize an Edwards MN-COM1S network module for connection to the EST3x panel. The software shall support textual annunciation of all system activity, no common control over the FACP is necessary.

PART 3 - EXECUTION

3.1 Installation

A. Installation Sequence

1. Installation of the systems shall be conducted in stages and phased such that circuits and equipment are installed in the following order:

    a. Riser conduits, AC power conduits and control cabinets.
    b. Fire command center, remote control panel(s), control component(s), annunciator(s), remote CRT terminal(s), and printer(s). Provide temporary mounting of fire command center in <location.>
    c. Conduits and wiring for complete notification circuits and appliance installation throughout facility.
    d. Pre-test the audible and visual notification appliance circuits.
    e. Install all new detection devices.
    f. Terminations between field devices and the associated control equipment.
    g. The detection system shall be switched over and end of each day the system shall be operational. At no time will the system be placed out of service over night.
    h. Complete the interface to the building automation system.
    i. Complete contractor pre-test of system.
    j. Complete system testing.

B. Conductors

1. The requirement of this section apply to all system conductors, including all signaling line, initiating device, notification appliance, auxiliary function, remote signaling, AC and DC power and grounding/shield drain circuits, and any other wiring installed by the Contractor pursuant to the requirements of these Specifications.
2. All circuits shall be rated power limited in accordance with NEC Article 760.
3. All new system conductors shall be of the type(s) specified herein.
4. All initiating circuit, signaling line circuit, AC power conductors, shield drain conductors and grounding conductors, shall be solid copper, stranded or bunch tinned (bonded) stranded copper.
5. All signaling line circuits, including all addressable initiating device circuits shall be 18 AWG minimum multi-conductor jacketed twisted cable or twisted shielded or as per manufacturer's requirements.
6. All non-addressable initiating device circuits, 24 VDC auxiliary function circuits shall be 18 AWG minimum or per manufacturer's requirements.
7. All notification appliance circuit conductors shall be solid copper or bunch tinned (bonded) stranded copper. Where stranded conductors are utilized, a maximum of 7 strands shall be permitted for No. 16 and No. 18 conductors, and a maximum of 19 strands shall be permitted for No. 14 and larger conductors.
8. All audible notification appliance circuits shall be 14 AWG minimum twisted pairs or twisted pairs shielded or per manufacturer's requirements.
9. All visual notification appliance circuits shall be 14 AWG minimum THHN or twisted pairs or twisted shielded pairs or per manufacturer's requirements.
10. Use existing wires and conduit in OSTC building, where existing devices are being replaced with new at the same location. The wiring should be tested ahead

of time ensure continuity with a test report. In case of the failing test replace the wiring. Include 20% of the existing wiring to be replaced in the bid.

11. Installed in EMT conduit in concealed space and RGS when exposed.

3.2 Field Quality Control

A. Test & Inspection

1. All intelligent analog addressable devices shall be tested for current address, sensitivity, and user defined message.
2. All wiring shall be tested for continuity, shorts, and grounds before the system is activated.
3. All test equipment, instruments, tools and labor required to conduct the tests shall be made available by the installing contractor.
4. The system including all its sequence of operations shall be demonstrated to the Owner, his representative, and the local fire inspector. In the event the system does not operate properly, the test shall be terminated. Corrections shall be made and the testing procedure shall be repeated until it is acceptable to the Owner, his representatives and the fire inspector.
5. At the final test and inspection, a factory trained representative of the system manufacturer shall demonstrate that the system functions properly in accordance with these specifications. The representative shall provide technical supervision, and participate during all of the testing for the system.
6. All fire alarm testing shall be in accordance with National Fire Alarm Code, NFPA 72 - 1999, Chapter 7.
7. A letter from the Contractor certifying that the system is installed entirely in accordance with the system manufacturer's recommendations and within the limitations of the required listings and approvals, that all system hardware and software has been visually inspected and functionally tested by a manufacturer's certified representative, and that the system is in proper working order.

END OF SECTION 283111

SECTION 284619 - PLC HARDWARE FOR ELECTRONIC SECURITY

PART 1 - GENERAL

1.1 SYSTEM DESCRIPTION

A. Furnish all materials and labor necessary to complete the installation of specific systems described herein and integration of all systems as indicated, specified herein or both. The work includes the following, as well as work not listed below but described elsewhere:

1. Graphical User Interface (GUI) shall integrate control and monitoring of major subsystems and devices indicated in Project Documents. The GUI shall act as an operator interface to the major security control and monitoring subsystems. Include programming that implements control and monitoring functions defined in project documents.
2. System shall include a complete IEEE 802.3 100/1000 BASE-T Local Area Network (LAN) that interfaces the GUI computers and the Programmable Logic Controllers (PLC), Intercom Control and Video Surveillance systems. This network is closed, only used by the Security Control Systems.
3. All electronic equipment furnished and installed by the Security Electronics Contractor shall be protected by transient voltage surge suppression. See Specification Section 280526.
4. Provide computer-based hardware and custom designed, application-specific, Microsoft Windows latest edition software that operates in conjunction with Programmable Logic Controllers (PLC) specified below to integrate or interface to all devices and systems.
5. Provide and install graphical control and annunciation icons on graphics mode video displays along with programming that provides the sequences of operation verified with the Owner and Architect Engineer during the software development process described in 284620-PLC Software for Electronic Security, Part - 3.1, Software Support.
6. The GUI computer shall contain graphics and wavetable programs only. All control logic programs shall reside in the PLC.
7. General Requirements of PLC System

    a. Provide a Programmable Logic Controller (PLC) system that is the product of a single company, which has regularly manufactured PLC equipment for a period of 15 years.
    b. Provide only components that are regularly used in industrial automation applications.
    c. Components must be in stock from a distributor within 100 miles of this facility or be able to be shipped next day to this facility.
    d. Provide only UL Listed components.
    e. Provide PLC System that seamlessly integrates the Control system to the Private Security Control System Local Area Network.
    f. Provide CPU(s) with a visual status indication of backup battery.
    g. Provide alarm in the event of CPU low battery voltage before battery failure and for communication failure.
    h. Provide 15% spare PLC system capacity at the completion of the project. This includes program memory, I/O memory allocation, register memory, user memory, etc.

i. Provide programming software memory usage summary with as-built documentation.
j. Provide 15% spare PLC I/O module capacity at the completion of the project. Calculate inputs and outputs separately when figuring capacities.
k. All Components must be mounted in a metal enclosure.
l. All PLC interposing relays must be fused to protect relay and field device wiring from over-current caused by shorts or device failure.
m. EMC filter must be installed on the power supply lines
n. PLC racks and modules shall be Din Rail mountable.
o. Din Rail must be mounted on a metallic surface that is grounded to earth using screws with star washers every 6 inches.
p. All Safety and Reference grounds for PLC equipment shall be in compliance with IEEE 1100.
q. Expansion and Remote Cables must be 100% shielded. A 100% shield means that the braided cable shield is connected to the metal shell of the connector.
r. Termination Labeling

    1) Each wire shall be labeled with an industry standard thermal transfer wire marker.
    2) I/O wire number should reference wiring diagram and Software I/O list.
    3) Felt tip pen labels are unacceptable.
    4) Power wiring should reference wiring diagram.
    5) Communication cables should reference wiring diagram and node ID.

s. The control architecture shall use distributed control over Ethernet. Each controller will share selected memory with all other controllers via broadcast messages over Ethernet.
t. All Ethernet communication shall be configured using producer/consumer exchanges without requiring PLC logic to drive the communications.
u. All Remote I/O shall be connected over Ethernet.
v. Remote I/O shall use the exact same module types and same I/O module part numbers as those that are used at the PLC's CPU unit.
w. PLC racks and Remote I/O drops shall be expandable up to 64 modules per Ethernet drop using local expansion cables.
x. All I/O modules shall utilize terminal block style wire connections and support hot removal and insertion
y. Output modules shall be available with Electronic Short Circuit Protection. The diagnostic status of the Electronics Short Circuit Protection (ESCP), for those discrete output modules containing ESCP, shall be indicated by a green LED during normal operation per point and amber during a fault. The fault should be auto-corrective without the need to cycle power.

8. Touch Screen Control Workstations

a. Provide single and dual touch screen control work stations as indicated on the plans
b. Primary control location of each door is noted within the door lock symbol on the plans.
c. The touch screens located in central control shall be the fail over/takeover control location. Hierarchy and sequence of fail over/takeover shall be as defined during the phase
d. I software development meeting.
e. Each Central Control touch screen station consists of two 24" LCD touch screens, computer CPU, wireless mouse, and keyboard.

9. Integration with Video Surveillance System

   a. Provide integration of the video surveillance system that allows VMS control to be accomplished through the GUI. Functions to include but not be limited to:

      1) Camera call up via touch screen icons
      2) Video follow audio functionality
      3) Video follow alarm functionality

   b. Administrative level configuration and set up functions are not required to be accessible from the GUI

10. Integration with intercom system

   a. Provide integration of the intercom system to allow automatic video follow audio functionality.

   b. Provide programming that allows all intercom master control functions to be accomplished through the GUI including but not limited to:

      1) Answer
      2) Answer and zoom
      3) Page zone activation
      4) Clear call without answering
      5) Connect without a call being placed
      6) View Queuing log
      7) GUI shall annunciate a call placed at the station and by screen on the key plan.

   c. Administrative level configuration and set up functions are not required to be accessible from the GUI.

11. Integration with Access Control

   a. Provide integration of the Access Control system that allows control of door access to be accomplished through the GUI. Functions include, but are not limited to:

      1) Door unlock
      2) Request to Exit
      3) Door Monitoring

PART 2 - PRODUCTS

2.1 GENERAL

A. Equipment specified is intended as a reference standard for level of quality.

B. Lists of products and manufacturers are Non-restrictive. Submission of an unnamed product or manufacturer does not require a substitution or change to the Contract Documents, but must comply with requirements for “Comparable Products” as outlined in Section 010 60 00 PRODUCT REQUIREMENTS.

C. Provide materials listed by UL or ETL.

2.2 GUI TOUCH SCREEN USER INTERFACE

A. GUI Touch Screen Monitor

1. Specifications

a. 24.0” diagonal
b. 16:10 active matrix TFT LCD
c. Usable screen

1) 21.4” Horizontal
2) 13.8” Vertical

d. 1920 x 1200 native resolution
e. 16.7 million colors
f. 5ms Response time
g. +/- 80 degree viewing angle horizontal or vertical
h. 1000:1 contrast ratio
i. 120 VAC 61 watts power consumption
j. Two 2 watt internal speakers
k. Audio input 3.5mm TRS jack
l. Weight, 27.8 lbs
m. 32 to 104 degree F operating temperature
n. Surface acoustic wave touch technology

2. Acceptable manufacturers

a. ELO Touch 2400 LM
b. Equal by HP
c. Equal by NEC

B. GUI Touch Screen Monitor Mounting Arm

1. Specifications

a. Accommodates GUI Touch Screen Monitor size.
b. Accommodates GUI Touch Screen Monitor weight.
c. Extends 16 inches (minimum).
d. Equipped with +/- 15 degree (minimum) tilt capabilities.

2. Acceptable Manufacturers

a. CorLiving A-202-MLM
b. Approved Equal

C. GUI Touch Screen Computer

1. Specifications

    a. Intel Xeon E5-1620, 10 Meg Cache, 3.6 GHz
    b. Windows 7 professional 64 bit
    c. 4GB ECC PC3 1333 MHz uDIMM
    d. NVIDIA NVS510 2GB DDR3 HP Win 7 Video Adaptor
    e. 3.5” internal SATA HDD 1 TB, 7200 RPM
    f. Integrated Ethernet Adaptor
    g. USB Keyboard and Mouse

2. Acceptable manufacturer

    a. Lenovo S30
    b. Equal by HP
    c. Equal by Dell

D. GUI Speakers

1. Integral to monitor

2.3 SECURITY SYSTEM MANAGEMENT COMPUTER (SSMC)

A. Computer

1. Specifications

    a. Intel Xeon E5-1620, 10 Meg Cache, 3.6 GHz
    b. Windows 7 professional 64 bit
    c. 4GB ECC PC3 1333 MHz uDIMM
    d. NVIDIA NVS510 2GB DDR3 HP Win 7 Video Adaptor
    e. 3.5” internal SATA HDD 1 TB, 7200 RPM
    f. Integrated Ethernet Adaptor
    g. USB Keyboard and Mouse
    h. ThinkVision LT1952P 16:9 19” LED Monitor

2. Acceptable Manufacturers

    a. Lenovo S30
    b. Equal by HP
    c. Equal by Dell

B. Printer

1. Specifications

    a. 21 ppm color or B/W
    b. 250 sheet input
    c. Network ready
    d. Standard 2.0 USB and Ethernet
    e. 128 MB RAM
    f. 417 MHz processor
    g. 500 to 1500 pages per month recommended usage
    h. 1200 x 1200 dpi printing

i. Weight – 54 lbs

2. Acceptable Manufacturers

a. Lexmark C540n
b. Equal by Canon
c. Equal by Epson

2.4 CONTROL SYSTEM LOCAL AREA NETWORK SWITCH

A. Specifications

1.	Configuration:	48 Ethernet 10/100/1000 ports 4 of which are dual purpose
2.	Catalyst 2960 software image	
3.	Switching fabric:	32 Gbps
4.	Forwarding rate:	39 mpps
5.	Memory:	64 MB DRAM & 32 MB flash
6.	MAC addresses:	Up to 8,000
7.	IGMP groups/Multicast routes:	Up to 255
8.	Configurable MTU:	9000 Bytes with jumbo frames
9.	1000BaseT ports:	RJ-45 connectors, 4 pair Cat 5 UTP
10.	Input power:	100 – 240 VAC auto-ranging
11.	Indicators:	
12.	Port link integrity	
13.	Port disabled	
14.	Port speed	
15.	Port full duplex	
16.	System status	
17.	System RPS	
18.	System link status	
19.	System link duplex	
20.	System link speed	
21.	Operating Temp:	32 – 113 deg F
22.	Operating relative humidity:	10 – 85% non-condensing
23.	MTBF:	167,606 hours
24.	Power consumption:	140 watts max
25.	Certifications:	UL listed, FCC part 15 Class A

B. Acceptable Manufacturers

1. Cisco 2960G-48 TC
2. HP

2.5 PROGRAMMABLE LOGIC CONTROLLER

A. General requirements

1. Provide a Programmable Logic Controller (PLC) system that is the product of a single company, which has regularly manufactured PLC equipment for a period of 15 years.
2. Provide only components that are regularly used in industrial automation applications.
3. Components must be in stock from a distributor within 100 miles of this facility or be

able to be shipped next day to this facility.

4. Provide only UL Listed components.
5. Provide PLC System that seamlessly integrates the Control system to the Local Area Network switches.
6. Provide CPU(s) with a visual status indication of backup battery.
7. Provide primary and secondary CPUs and provide redundant power supplies on all CPU and I/O racks.
8. Provide alarm in the event of CPU low battery voltage before battery failure.
9. Provide 15% spare PLC system capacity at the completion of the project. This includes program memory, I/O memory allocation, register memory, user memory, etc.
10. Provide programming software memory usage summary with as-built documentation.
11. Provide 15% spare PLC I/O module capacity at the completion of the project. Calculate inputs and outputs separately when figuring capacities.
12. All Components must be mounted in a metal enclosure.
13. All PLC interposing relays must be fused to protect relay and field device wiring from over-current caused by shorts or device failure.
14. PLC AC power supply must be supplied through an IEC-rated isolation transformer.
15. EMC filter must be installed on the power supply lines
16. PLC racks and modules shall be Din Rail mountable.
17. Din Rail must be mounted on a metallic surface that is grounded to earth using screws with star washers every 6 inches.
18. All Safety and Reference grounds for PLC equipment shall be in compliance with IEEE 1100.
19. Expansion and Remote Cables must be 100% shielded. A 100% shield means that the braided cable shield is connected to the metal shell of the connector.
20. Termination Labeling

    a. Each wire shall be labeled with an industry accepted wire marker
    b. I/O wire number should reference wiring diagram and Software I/O list.
    c. Felt tip pen labels are unacceptable
    d. Power wiring should reference wiring diagram.
    e. Communication cables should reference wiring diagram and node ID

21. The control architecture shall use distributed control over Ethernet. Each controller will share selected memory with all other controllers via broadcast messages over Ethernet.
22. All Ethernet communication shall be configured using producer/consumer exchanges without requiring PLC logic to drive the communications.
23. All Remote I/O shall be connected over Ethernet.
24. Remote I/O shall use the exact same module types and same I/O module part numbers as the PLC's.
25. PLC racks and Remote I/O drops shall be expandable up to 64 modules per Ethernet drop using local expansion cables.
26. All I/O modules shall support hot removal and insertion.
27. Output modules shall be available with Electronic Short Circuit Protection. The diagnostic status of the Electronics Short Circuit Protection (ESCP), for those discrete output modules containing ESCP, shall be indicated by a green LED during normal operation per point and amber during a fault. The fault should be auto-corrective without the need to cycle power.

B. Specifications

1. PLC Central Processor Units

a. Maximum 2048 inputs and 2048 outputs I/O capacity
b. Maximum 64K word instruction memory
c. RS-232 ASCII configurable auxiliary com port
d. Bit instruction execution time of 0.80µs max
e. Built in real time clock and calendar
f. Built in 10BaseT 10Mb/sec Ethernet port
g. Battery backed EEPROM memory
h. Connectivity via Ethernet, Devicenet, Sysnet, Systlink, Mod Bus RTU master/slave over RS-485 and RS-232-C.
i. Shock rating, operating – 30.0g (3 pulses, 11 ms)
j. Vibration rating – 1.0g @ 5-2000 Hz
k. Operating Temperature range – 32 to 140 Degrees F
l. Operating Humidity range 5 – 95% RH non-condensing

2. PLC Digital DC Input Modules

a. 10 – 30 VDC operating range
b. Sourcing or Sinking type modules
c. Maximum on/off signal 0.5mS max with selectable 1 or 7mS filter
d. Maximum off state current 0.5mA
e. 32 point modules minimum
f. Maximum backplane current load – 50mA

3. PLC Digital DC Output Modules

a. 10.2 - 30 VDC operating range
b. Sourcing or Sinking type modules
c. Maximum continuous current per output, .5 amp sourcing/1.0 amp sinking
d. Maximum continuous current per module, 8 amp sinking or sourcing @ 60 degrees C
e. 32 point modules minimum
f. Maximum backplane current load – 90mA @ 5 VDC
g. Removable terminal blocks
h. Gold plated contacts

4. PLC Power Supplies

a. 120/220 VAC nominal input voltage
b. Maximum input power, 27 VA
c. Backplane output current, 1.5 amps total
d. Operating Temperature range – 0 to 60°C
e. Operating Humidity range 5 – 95% RH non-condensing

C. Acceptable Manufacturers

1. Omron CS-1D Series
2. Allen Bradley
3. Modicon Momentum Series

2.6 LINEAR POWER SUPPLY

A. Specifications

1.	AC Input:	120 VAC, +10%, -13%
2.	DC Output:	24 VDC @ 12 amps
3.	Line Regulation:	+/-.05% for a 10% change
4.	Load Regulation:	+/- .05% for a 50% load change
5.	Output Ripple:	3 mV peak-to-peak maximum.
6.	Transient Response:	50 microseconds for 50% load change.
7.	Short Circuit Protection:	Automatic current limit/fold back
8.	Stability:	+/-.05% for 24 hours after warm up.
9.	Efficiency:	55%

10. Provide back plates, mounting hardware and all appurtenances required to install the power supplies in the system equipment racks.
11. An individual homerun cable is required between each field device powered by the power supply.
12. The output of the power supply is to feed a series of fuses rated for the intended load one each per homerun cable/device load.

B. Acceptable Manufacturer

1. SL Power F2412A+
2. Sola SMP B6
3. Power One F24-12A

2.7 GENERAL PURPOSE RELAYS (LOW CURRENT LOAD < 6 AMPS)

A. Specifications

1.	Switching Capacity:	6 Amp
2.	Termination:	Blade
3.	Operating Indicator Light:	Coil Rated Current:< 70 ma
4.	Operating Voltage	24 VDC
5.	Max. Cont. Applied Volt:	110%
6.	Drop-out Voltage:	10%
7.	DIN Rail Mountable Socket	
8.	Contacts Material	Gold Plated Silver

B. Acceptable Manufacturer

1. Idec
2. Potter and Brumfield
3. Finder

2.8 GENERAL PURPOSE HIGH POWER CONTROL RELAYS (HIGH CURRENT LOADS < 10 AMP)

A. Specifications

1. The control relays shall do the actual switching of the power to high current devices - locks, receptacles, etc.
2. Relays contacts shall be U.L. listed for a continuous current of 10 amps (inrush of 16 amps)
3. Each relay contact to the control device shall be individually fused externally with an indicating fuse holder.
4. Termination: Screw compression
5. Operating Indicator Light
6. Coil Rated Current: < 70 ma
7. Operating Voltage 24 VDC
8. Max. Cont. Applied Volt: 110%
9. Drop-out Voltage: 10%
10. DIN Rail Mountable Socket
11. Relays shall be pluggable with diode protection across coils and LED indication of activated coil circuit.
12. Low voltage wiring in relay cabinet shall be separated from high voltage wiring and all wiring shall be color-coded and marked with approved wire markers.
13. Control wiring shall be routed through plastic wire duct and landed on terminal strips.
14. Relays shall be controlled directly by the PLC.
15. Peripheral interface cards with active circuitry shall not be approved.
16. Relays shall have integral manual activation switch to override PLC for circuit testing and troubleshooting.
17. 24 VDC coil 1.2 watts or less
18. SPST of DPDT as required.

B. Acceptable Manufacturer

1. Idec
2. Potter and Brumfield
3. Finder

2.9 FUSED TERMINAL BLOCKS

A. Specifications

1. Din Rail mountable IEC style
2. dead front safety (ie. touch safe)
3. Screw clamp and Spring Clamp are acceptable
4. All Fuse terminal blocks shall be sized according to the wire gauge and currents load required for the application.
5. All Fuse Holders shall have a blown fuse indicator

    a. DC circuits shall have LED
    b. AC circuits shall have Neon or Trip lever

6. Provide lever disconnect type IEC fuse blocks.

B. Acceptable Manufacturer

1. Allen Bradley 1492-H5
2. Phoenix Contact UK-5 HESI
3. Square D AB1SF520

2.10 MODULAR TERMINAL BLOCKS

A. Specifications

1. Din Rail mountable IEC style
2. dead front safety (ie. touch safe)
3. Screw clamp and Spring Clamp are acceptable
4. All terminal blocks shall be sized according to the wire gauge and currents load required for the application.
5. Safety grounds should be identified with yellow/green color.
6. One wire per termination point unless Ferrules are used for Special Applications
7. All Ferrules are to be Crimped using the manufacturer's recommended Crimping tool.

B. Acceptable Manufacturer

1. Allen Bradley 1492-J4
2. Phoenix Contact UT-4
3. Square D AB1VV

PART 3 - EXECUTION

3.1 INSTALLATION

A. All initial system programming shall be done at the Security Electronics Contractor's facility prior to installation on site.

B. The System shall be installed by qualified personnel in strict compliance with manufacturer's instructions.

C. Upon completion of system programming enable the write protect function of the PLC CPU

D. Prevent unauthorized communications with the PLC CPUs by restricting the PLC to respond only to specific IP addresses. IE: "OMRON IP to FINS table set up."

E. Wiring shall be color coded, uniform and in accordance with national electric codes and manufacturer's instructions.

F. Equipment shall be firmly secured, plumb and level.

G. All cable runs to the main equipment rack shall be tagged and identified.

H. Coordinate all work with General Contractor - other Trades Contractors.

I. Grounding of electronics control cables, and peripheral equipment shall be installed per section 280526 and manufacturer's direction to eliminate noise induction and achieve optimum system performance.

J. Install and configure Security local area network as required for control and communication between system devices. When required, provide necessary coordination, termination, and programming associated with integrating Security local area network with facility network.

K. Equipment cabinets shall be assembled in the Security Electronics Contractors shop prior to delivery to the job site.

L. All cabling shall be continuous between field device and equipment cabinet. Terminations shall be to terminal boards with punch down blocks, or on screw terminals. Twisted and taped splices are unacceptable.

3.2 SOFTWARE SUPPORT

A. Refer to Section 284620 – Software for Electronic Security for software support and programming requirements.

3.3 SYSTEM INITIALIZING AND PROGRAMMING

A. All programming shall occur in the Security Electronics Contractor's shop prior to installation on site.

B. The System shall be turned on and adjustment made to meet requirements of the specification and on-site conditions.

C. The System shall be programmed to function as specified.

D. Any special programming shall be documented and a written copy given to the Owner.

E. Coordinate integration of other electronic systems as called for in the contract documents.

3.4 SYSTEM TEST PROCEDURES

A. The system shall be completely tested to assure that all components are hooked up and in working order.

B. The System shall be pre-tested by the Security Electronics Contractor and certified, in writing, to function in accordance with the plans and specification.

C. The Security Electronics Contractor is to verify the system is communicating with all controlled devices.

D. Testing to be performed in the Security Electronics Contractor's shop prior to delivery-

1. Test 120VAC power equipment and hardware internal to all equipment racks. Test all conductors for shorts, opens, and polarity.
2. Utilizing a test jig, simulate the operation of every circuit required.

E. Testing to be performed at the job site prior to delivery of the system

1. Verify all field wiring is free of shorts and opens prior to termination of head end

electronics.

2. Test all 120VAC power sources for correct polarity and voltage. Test grounding system for continuity. Notify General Contractor and Electrical Contractor of any problems.

F. Additional job site testing

1. After installation of head end electronics, verify proper operation of all field devices including locks, door position switches, card readers, push buttons, and intercom stations.
2. Verify proper integration between control system and

   a. Door control system
   b. Video surveillance system
   c. Intercom/Paging system
   d. Overhead door controls

   e. Handicap assist door operators

G. The System shall be completely tested to assure that all components are hooked up and in working order. Inspect system for defects. Correct all causes of such defects. If the cause is outside of the scope of the Division 28 series scope of work, promptly notify the General Contractor and the Architect Engineer in writing, indicating the cause of the defect and suggested corrective procedures.

H. Provide written documentation showing all test results.

I. The System shall be final tested in the presence of the Architect Engineer. Security Electronics Contractor is to provide all required testing equipment.

3.5 FIELD QUALITY CONTROL

A. Provide services of a duly factory authorized service representative for this project location to supervise the field assembly and connection of components and the pre-testing, testing, and adjustment of the system.

B. Make observations to verify that units and controls are properly labeled, and interconnecting wires and terminals are identified. Provide a list of final tap settings of paging speaker line matching transformers.

C. Rectify deficiencies indicated by tests and completely re-test work affected by such deficiencies at Trade Contractor's expense. Verify by the system test that the total system meets the Specifications and complies with applicable standards.

3.6 TRAINING

A. Provide the facility personnel with training in the use and maintenance of the entire control system. Coordinate the training sessions with the Owner. Completed classroom sessions shall be documented by the Security Electronics Contractor, certified by the attending Owner representatives, and approved by the Architect Engineer. Instruction shall take place during normal working hours (Monday through Friday, 8:00 a.m. to 5:00 p.m.). Instruction shall not begin until all systems are operational as designed.

B. The training sessions shall cover the operation and the maintenance manuals and the control console operators manuals and service manuals in detail, stressing all important operational and service diagnostic information necessary for the maintenance and operations personnel to efficiently use and maintain the control system.

C. Security Electronics Contractor is responsible for providing operational and maintenance training applicable to the entire control system. Training is to include, but not be limited to the following-

1. Review all O+M manuals with Owner representatives present for training.
2. Perform a tour of the entire facility. During the tour the trainer shall point out all control equipment and provide a brief description of its purpose and use. This is to include but not be limited to control panels (graphic and pushbutton), all control system hardware, and devices controlled.

END OF SECTION 284619

SECTION 284620 - PLC SOFTWARE FOR ELECTRONIC SECURITY

PART 1 - GENERAL

1.1 SYSTEM DESCRIPTION

A. Furnish all software and programming labor necessary to complete the installation of specific systems described herein and integration of all systems as indicated, specified herein or both. The work includes the following, as well as work not listed below but described elsewhere:

1. Programming of Security Systems Management Computer (SSMC). Include programming that implements system transaction logging, access control functions, and database retrieval functions.
2. Programming of Graphical User Interface Consoles (GUI). Include programming that implements Touch-screen control and monitoring functions defined in project documents.
3. Programming of Access Control Systems. Include programming the implements Access Control system interface functions and integration with the GUI.
4. Programming of Video Surveillance systems. Include programming that implements video surveillance system internal functions and integration with the GUI.
5. Programming of Intercom systems. Include programming that implements Intercom internal functions and integration with the GUI.
6. Computers shall be programmed such that any computer can be placed at any Touch Screen Location and reboot to that specific operator application without reprogramming.

PART 2 - PRODUCTS

2.1 GENERAL

A. Equipment specified is intended as a reference standard for level of quality.

B. Lists of products and manufacturers are Non-restrictive. Submission of an unnamed product or manufacturer does not require a substitution or change to the Contract Documents, but must comply with requirements for “Comparable Products” as outlined in Section 010 60 00 PRODUCT REQUIREMENTS.

C. Provide materials listed by UL or ETL.

2.2 GUI SOFTWARE/GRAPHICS

A. Basis of design

1. These specifications are written using the Omron IWS or Omron Indusoft product. Any product by another manufacturer must include the same features and functions to those listed below.

B. Specifications

1. Include the most recent PLC protocols from the PLC manufacturer and allows direct communication with ALL current, future and legacy OMRON networks (SYSNET, SYSLINK, ControllerLink, Ethernet and EthernetIP)
2. Provide software that is all-inclusive for communications, graphics, alarming, databasing, etc. No need for "add-on" software modules to provide these features.
3. Provide software that allows global changes to system icons
4. Provide software that allows changes to workstations/runtime licenses “on the fly”; software that requires a workstation to be shut down to make a change shall not be considered.
5. Software that includes third party I/O drivers shall not be considered.
6. Systems that utilize polling to determine the status of I/O points shall not be considered.
7. Provide displays utilizing accurately depicted, properly aligned floor plans. Floor plans must be displayed as seen from the GUI console operator’s perspective (i.e.; rooms and doors in front of the operator at the top of the display, rooms and doors behind the operator at the bottom of the display). GUI consoles facing different directions must display accordingly different floor plans.
8. Provide displays that optimize the use of screen resolution and color to enhance and simplify the information displayed. Provide a textured, dull, light gray background for all displays. Provide displays that minimize the unnecessary use of highly saturated colors. Provide displays that utilize contrasting colors. Utilize color to clarify annunciation, highlight choices and indicate correct operator input. Saturated colors shall be used to annunciate conditions of devices other than their normal or secure state. Use red for alarm conditions, yellow for cautionary conditions and information such as the depiction of interlock groups, use green for intercom and blue for video surveillance devices.
9. Provide properly sized control icons that are a minimum 1/2" square. Control icons must be large enough to facilitate proper and easy operation. Where screens are congested and placement of icons becomes difficult, divide the screens and increase the scale of the background so that the icons can be properly placed.
10. Provide control icons and annunciation icons that provide an intuitive depiction of their purpose. Control icons and annunciation icons shall utilize color to indicate abnormal or “on” conditions only. Control icons and annunciation icons associated with devices that are in a normal or off state shall utilize muted, de-saturated colors.
11. Provide programming that uses a cursor to depict the control icon that has the current focus. Provide programming that allows the user to place a cursor on the screen and “drag” the cursor over the desired control icon, activating the associated function when the cursor is released (“activation on liftoff”). As the cursor moves over a control icon, the icon should “highlight” to indicate that if the cursor is released the icon shall activate. Annunciation only icons should not function in this fashion. Using the touch capability of the system, the operator shall be able to “drag” the cursor across the screen to the desired icon with the same effect as moving the mouse to control the cursor.
12. Provide a mouse for each GUI. Moving the cursor with the mouse shall provide the same highlighting function as described above. Touching or left clicking the mouse shall activate the highlighted device.
13. Provide programming that ensures that any screen can be displayed in a maximum of two (2) touches. Provide “pan” function icons to display adjacent areas. Provide “zoom” function icons to display enlarged views of areas.

14. Screen display redraw/update/remote device response time thru-put shall be held to 0.5 seconds maximum. Activating a control icon shall cause the associated field device to operate within 0.5 seconds maximum. A field device that changes state must cause an annunciation icon to change state within 0.5 seconds maximum.
15. Provide the number of graphic "screens" that supports the sequences of operation verified with the Owner and Architect Engineer during the software development process described in Part - 3.1, Software Support. Any screen that the user or security consultant determines is to densely packed or too “busy” shall be subdivided at no expense to the Owner.
16. Locate global control function icons in a “tool bar” configuration. Users shall have the ability to locate the tool bar on the top, bottom, right or left of the screen.
17. Tool bar functions may be divided into global functions and miscellaneous functions at the integrators discretion. Display of global and miscellaneous tool bars may be configured independently.
18. Place icons for "high traffic" functions on multiple screens as verified with the Owner and Architect Engineer during the software development process described in Part - 3.1, Software Support. Any icon that the user or security consultant determines is necessary on more than one screen shall be provided on more than one screen at no cost to the Owner.
19. Provide software that annunciates alarms until they are acknowledged, independent of screen displayed. Provide prioritization of alarms as verified with the Owner and Architect Engineer during the software development process described in Part - 3.1, Software Support.
20. Provide a method for unanswered alarms to move to a designated GUI as verified with the Owner and Architect Engineer during the software development process described in Part - 3.1, Software Support.
21. Graphical User Interface operators consoles are intended to operate in concert with each other, i.e.; Silencing an alarm on one screen causes the alarm to be silenced on all other screens displaying the same alarm. Multiple operations on multiple screens to silence the same alarm are not acceptable.
22. Hierarchy of Control - During the software development process described in Part - 3.1, designated GUI takeover scenarios shall be confirmed and provided by the integrator under Base Bid.
23. During the software development process described in Part - 3.1, interlock groups shall be confirmed and provided by the Trade Contractor under Base Bid.
24. Provide a “Supervisors Utility Screen”, protected by a pin code to allow updating of modifiable system parameters as verified with the Owner and Architect Engineer during the software development process described in Part - 3.1, Software Support.
25. Provide for instant connection of the intercom system master station to the calling station selected from the GUI.
26. Provide instant display or manual selection of the screen showing the alarm location or the calling intercom location graphically as verified with the Owner and Architect Engineer during the software development process described in Part - 3.1, Software Support.
27. In addition to manual camera call up by touching a camera icon, provide for automatic video surveillance camera call-up to a designated monitor from the GUI. Provide automatic call-up of the nearest video surveillance camera upon intercom connection (“Video follow Audio”) or alarm “seek” display (Video follow Alarm”) as verified with the Owner and Architect Engineer.

28. Provide automatic GUI calibration during System "boot-up" without operator input and manual calibration accessible from the Supervisors Utility Screen.
29. Provide user selectable audible feedback on all icon commands. This audible feedback shall be selectable between male voice, female voice, or a tone. This shall be selected from the miscellaneous function icons as described above. Menu of tones shall be reviewed and tones shall be selected by the Owner during the phase I software development process described in Part 3.1, Software Support.
30. Provide unauthorized entry alarm for monitored or controlled door going unsecured with no corresponding unlock command from system; on GUI, provide visual and unique audible annunciation and location information on message text line.
31. Provide 2 step operations for activations of devices that reduce the security or safety of the facility. These operations include, but are not limited to unlocking doors, holding doors open, group release, isolating doors or intercoms, etc.
32. Provide 3 step operations for critical changes to secure status such as interlock overrides, emergency release, etc.
33. Provide single step operations for operations that increase or have no impact on secure status such as locking doors, camera call up, intercom select, etc.
34. Provide architectural labeling of rooms and spaces, Owner defined labeling of rooms and spaces, and the ability for the operator to switch between the two labeling schemes.
35. Provide the ability to do hard copy and archival logging of all system events and transactions.
36. Provide programming that disables all methods of switching from the security control application to the operating system except with appropriate supervisory level password.
37. The development tools used for the graphical interface shall be that of a nationally recognized industrial applications software development package with a national support network.
38. Implement programming that initiates “video follow” functions for intercom devices and alarms. All intercoms and alarms with in the field of view of a camera shall be automatically routed to the appropriate monitors when the alarm or intercom becomes active.

C. Acceptable Manufacturers

1. Omron Indusoft 512k
2. Wonderware Intouch Runtime 60K with I/O
3. GE Cimplicity no limit runtime

D. Software design and implementation

1. All monitoring and login logic shall be programmed within the Cimplicity, Omron Indusoft or Wonderware application. The security management system software and the Input/Output Data Access Servers shall be Cimplicity, Omron Indusoft or Wonderware brand; no other approach shall be considered.
2. The finished software product shall be examined by the manufacturer and the Architect Engineer for compliance with this specification. Should the examination reveal that proprietary code was created; the integrator shall remove such code and replace it at no additional cost to the owner. The process shall be repeated until the Owner and Architect Engineer are satisfied that the system as developed contains no proprietary content that would prevent the system being maintained by another service provider.

3. The system integrator shall turn over all programming passwords, source code and programming schedules at the end of the project. Prior to final payment all software shall be authenticated as being non-proprietary by the Owner or the Owner's designated representative as described above.
4. All PLC I/O addresses from the Cimplicity, Indusoft or Wonderware environment shall have continuous communication with the PLC. No Cimplicity, Indusoft or Wonderware programming tag PLC addresses shall be changed during runtime.

2.3 GUI CONTROL STATION ICON (SWITCH) FUNCTION AND DESCRIPTION

A. Specifications

1. GUI Switch Functions

   a. Door Control Icons
   b. Utility Control Icons (Lighting, Power, Water, Phone)
   c. Log In/Out, Satellite GUI Takeover and GUI Disable Icons
   d. Intercom Control and Call Disable Icons
   e. Key Plan Zoom Window
   f. Alarm Silence and Reset Icons
   g. Monitor Selection/Camera call-up Icons
   h. Other functions as defined during the software development process described in Part - 3.1, Software Support.
   i. Elevator Controls

2. Provide animation of actual control and annunciation icon as verified with the Owner and Architect Engineer during the software development process described in Part - 3.1, Software Support.
3. Throughout the software design process linking of "follow" functions shall be accommodated as part of the basic scope of services. Follow functions shall be defined as camera calls to specified monitors based on intercom, alarm or door control functions; or, intercom talk paths automatically being established based on alarm functions. Automated "follow" functions shall be limited to camera and intercom functions. No automated door release functions shall be allowed.
4. Door Control Icons

   a. Door Unlock

      1) Touch or left click the Unlock global function icon.
      2) Touch or left click the associated door icon.
      3) The security system momentarily applies power to the lock or electrically operated door to start the lock or door through its unlock or open cycle.
      4) The unlock function remains enabled for 3 seconds after each door icon is touched. If the timer lapses and no icon is selected, the unlock global must be selected again to reactivate the function.

b. Group Unlock

1) Touch or left click the Unlock global function icon.
2) Touch or left click the associated door group icon.
3) The security system momentarily applies power to the locks or electrically operated doors in the group one at a time to start them through their unlock or open cycles.
4) During a group unlock, an isolated door shall not be powered.
5) The unlock function remains enabled for 3 seconds after each door icon is touched. If the timer lapse and no icon is selected, the unlock global must be selected again to reactivate the function.

c. Door Hold Open

1) Touch or left click the Hold Open global function icon.
2) Touch or left click the associated door icon.
3) The security system applies power to the lock or electrically operated door to maintain the lock or electrically operated door in the unlock or open position.
4) The held open function remains enabled for 3 seconds after each door icon is touched. If the timer lapses and no icon is selected, the hold open global function must be selected again to reactivate the function.
5)

d. Door Lock

1) Touch or left click the associated door icon.
2) If necessary, the security system momentarily applies power to or removes power from the lock or electrically operated door to start the lock or door through its lock or close cycle.

e. Door Stop

1) Touch or left click the Stop global function icon.
2) The security system shall stop all powered moving doors being controlled by the initiating GUI.

f. Isolate

1) Touch or left click the Isolate global function icon.
2) Touch or left click the associated device icon. (doors or intercoms)
3) The security system isolates the device from normal operation.
4) The isolate function toggles each time a device is selected. The isolate global function remains active for 3 seconds after the last device selected.
5) Provide group “synchronization.” Selecting the isolate global function and a group button the first time shall un-isolate any door in the group that is currently isolated. Selecting the group button the second time, shall isolate all doors in the group.

g. Emergency Door Release

1) Touch or left click the EMERGENCY DOOR RELEASE miscellaneous function icon.
2) When the EMERGENCY DOOR RELEASE icon is selected, a red pop up message box shall be displayed with a written warning and the audible annunciation shall warn the operator of the danger associated with an Emergency Door Release. The audible warning must reiterate the displayed text and must play in its entirety before the first level confirmation icon is displayed.
3) A second, red EMERGENCY DOOR RELEASE warning box shall then appear on the current screen with a written warning.
4) The function can be canceled at any time by selecting the CANCEL button.
5) After the second confirmation is selected, the background around the EMERGENCY DOOR RELEASE icon shall flash and the audible annunciation shall continuously announce “EMERGENCY DOOR RELEASE”.
6) All emergency release doors shall be unlocked. Those doors that are unlocked under the emergency door release, shall display as if opened via the control system. These doors are equipped with half cycle locks. See detention hardware section for lock function description to be incorporated into the controls system.
7) Other control stations also monitoring or controlling the same doors as the panel initiating the release shall have an EMERGENCY DOOR RELEASE ACTIVE indication located on their screen and will alarm and flash as described previously.
8) Emergency Relock. Provide EMERGENCY DOOR RELEASE RELOCK miscellaneous function icon. This Icon releases the affected door to relock.

h. Interlock Override Icon

1) Touch or left click the Interlock Override miscellaneous function icon.
2) A yellow pop up message box shall be displayed with a written warning and the audible annunciation shall warn the operator of the danger associated with interlock override. The audible annunciation warning must reiterate the displayed text and must be capable of playing in its entirety before the second level confirmation icon is displayed. Delay must be adjustable and confirmed during phase I and II.
3) A second yellow interlock override warning box shall then appear with a written warning. The audible feedback warning must reiterate the displayed text and must be capable of playing in its entirety before the first level confirmation icon is displayed. Delay must be adjustable and confirmed during phase I and II.
4) Only after the second confirmation is made shall the interlock indications be removed from the screen.
5) Once any door icon is selected, the interlock override function shall cancel. If no door icons are selected within 10 seconds of the second confirmation, the interlock override function shall cancel. Also, the function can be canceled at any time by selecting the “CANCEL” icon.
6) Attempting to unlock a door that is interlocked shall cause the voice

annunciation system to state, "Function not allowed. Door is interlocked."

5. Utility Control: Lighting, Power Receptacles, Water, and Inmate Phone.

   a. Utility control icons are to be located on the utility control screen. The utility control screen shall segregate the utility icons from security icons such as door locks, intercom and video surveillance. Selection of the utility screen shall be via the global function tool bar.
   b. Touch or left click the global utility icon, the normal icons are hidden and the utility icons are displayed.
   c. Touch or left click the associated control icon.
   d. The security system removes power from the coil of the low voltage relay associated with the device to be controlled, and the utility comes on.
   e. Touch or left click the icon a second time.
   f. The security system applies power to the coil of the low voltage relay and maintains power until the icon is clicked again. When the relay is engaged the utility is off.
   g. Provide group control of cell lights.
   h. Provide group "synchronization." Selecting the group button the first time shall turn any utility in the group that is currently on to its off state. Selecting the group button the second time, shall turn all utilities in the group on.
   i. Utility control shall be configured such that failure of the PLC/GUI control systems renders the utility "on".
   j. An icon shall be provided in central control for manual activation of the smoke evacuation system. The manual activation shall be used to provide a means of evacuating tear gas in the event it is used on a unit. The icon shall function as described above and shall activate the sequence of operation just as if it were started by the fire alarm system.
   k. TV Receptacle.

6. Log In, Satellite GUI Takeover and GUI Disable

   a. Log In/Out

      1) Touch or left click the Log in/out icon.
      2) Login validation shall be integrated with the SSMC's database to allow the tracking of the operators name for all functions at each GUI until it is logged off.
      3) The GUI displays a "scrambled" numeric keypad for the operator to enter a PIN code.
      4) If the PIN code is valid the operator is logged in as the current operator of the station.
      5) An operator remains the current operator until a new operator is logged in or until the GUI is taken over or disabled (see below).

   b. Satellite GUI Takeover

      1) Touch or left click the Satellite GUI Takeover icon.
      2) The security system disables all control and monitoring functions at the Satellite GUI, blocks all attempts to log in at the Satellite GUI and transfers control and monitoring responsibility to the initiating GUI. Icon shows "Off Line".
      3) Touch or left click the icon a second time.

4) The security system allows attempts to log into the Satellite GUI, but retains control and monitoring until an operator logs into the Satellite GUI.
5) When an operator is logged in to the Satellite GUI the control system returns all previous control and annunciation to the Satellite GUI. Central Control shall still have the ability to view the locally controlled screens. Central Control's icons in these locally controlled areas shall appear to be "sunken" into the screen with a passive or muted video color. The status of the DPS and LSS shall be dynamically displayed. The intent is to allow Central Control to be aware of door movement throughout the building, while leaving control of devices with the Satellite GUIs.
6) Failure of the workstation or software at the satellite locations shall cause control to be transferred to the designated takeover station. A pop up window annunciating the failure and transfer shall be provided to alert the operator of the takeover station as to the transfer.

c. GUI Disable

1) Touch or left click the Disable icon.
2) The security system immediately logs out the current station operator and transfers responsibility for control and annunciation to central control. Satellite GUI shall still have the ability to view the locally controlled screens. The icons in these locally controlled areas shall appear to be "sunken" into the screen with a passive or reverse video color. The status of the DSS and LSS shall be dynamically displayed. The intent is to allow the Satellite GUI to be aware of door movement in their areas, while control is transferred to the designated control point.
3) Attempts to log into the station are not allowed until central control enables the satellite station.

7. Intercom Control

a. Intercom Control

1) Call-in from field device causes associated Intercom Station icon to flash and tone/VAS to sound.
2) Selecting the Intercom Station icon connects the Master Intercom to the associated intercom station in listening mode, turns the icon solid color and silences the call in tone/VAS.
3) Selecting the same icon a second time disconnects the call, and turns off the solid icon color.
4) Selecting a second intercom icon while connected to another station causes the connected station to disconnect and connects the selected station.
5) When a call is designated to route to more than one master, the establishing of a talk path by the first to answer the call, cancels the call at the other stations.
6) Implement video follow audio for adjacent cameras. When an intercom talk path is established, the associated camera (if any) shall be displayed on the Intercom Monitor, and the associated camera icon shall indicate it has been activated.
7) The intercom system incoming shall be routed through the GUI

Audio System.

b. Communications Window

1) A portion of each screens tool bar, without obstruction to the floor plan, shall be allocated for intercom que. This window shall contain a “Pending List” of the next (7) pending calls.
2) Call Control Icons and Indicators include:

a) ACTIVE STATION containing the text name of the active intercom call
b) Master to Master call (Caller ID)
c) Master call waiting/busy
d) CALL ANSWER button
e) CALL ANSWER AND ZOOM button,
f) ZOOM ACTIVE button
g) CALL DISCONNECT button

3) This window shall allow the operator to answer calls without having to go to a particular screen (answer) unless it is desired to do so. (answer and zoom)

c. Pending List

1) The list of incoming pending calls designated for the particular GUI shall show the Owner-assigned text names for the oldest seven pending calls that have not been answered and in the order that they were initiated.
2) As a call is answered it shall be removed from the list and the list shall be automatically updated with any new incoming calls.
3) If a call-in is isolated, it should not be displayed in the Pending List.
4) If a master to master call is placed, and the receiving master is busy, the calling master receives a busy prompt and is held in queue until call is accepted by the master being called.

d. Call Answer Button

1) Touch or left click the Call Answer Button
2) Each time this button is selected, the active station shall automatically cancel and the first station on the pending list shall automatically connect.
3) If there are no pending calls, this button shall be muted on the tool bar.

e. Call Answer and Zoom Button

1) Touch or left click the Call Answer and Zoom Button
2) Each time this button is selected, the active station shall automatically connect to the first station in the call queue.
3) The GUI shall automatically go to the screen where the answered intercom station is located.
4) If there are no pending calls, this button shall be muted on the tool bar.

f. Zoom Active Button

1) Touch or left click the Zoom Active Button.
2) When this button is selected, the GUI shall automatically go to the screen where the connected intercom station is located.
3) If there is no active call, this button shall be muted on the tool bar.

g. Call Disconnect Button

1) Touch or left click the Call Disconnect Button
2) When this button is selected, the active intercom call is disconnected.
3) If no station is connected, this button shall be muted on the tool bar.

h. Call Isolate

1) Selecting the isolate button from the global function tool bar and then selecting an intercom station icon shall place the intercom station in isolate mode.
2) In the isolate mode, calls placed from the station shall annunciate visually only and not via the tone/VAS.
3) When placed in the isolate mode, the icon shall change state to reflect the mode.
4) When placing an icon in the isolate mode, the operator shall be prompted to enter the reason the station was isolated using the occurrence log.
5) All isolated icons shall reset to normal mode at a time selected by the Owner; the duration of an isolation shall not exceed 24 hours.

i. Paging. Provide icons associated with the paging zones.

8. Key Plan and Zoom Window

a. Zoom Window

1) A portion of the tool bar on each screen, without obstruction to the floor plan, shall be allocated for the key plan. This window shall contain a whole site plan and be located on every screen.
2) All screens shall be accessible with no more than two touches of the site plan.
3) Any screen can be accessed from any other screen with no more than two touches. A screens outlined area on the site plan shall highlight when the curser is placed over the associated section of the key plan.
4) Each control screen shall be geographically outlined on the Zoom Window. The highlighted outline shall follow the shape and pattern of the zoom screen area.
5) The Zoom Window shall contain -

a) Zoom Area
b) Site Plan Location Indicator
c) Site Plan Pending Call Indicator
d) Site Plan Alarm Indicator

b. Zoom Area

1) Touch or left click outlined area of the site plan.
2) Activation shall cause the GUI to go directly to the screen that controls the selected area or a more detailed zoomed area.
3) A distinctive audible sound shall annunciate when this action is performed.

c. Site Plan Location Indicator

1) The area on the site plan that represents the current screen shall be highlighted in white to indicate exactly what screen is active in relation to the whole facility.
2) The other areas shall be gray unless pending calls or alarms are active as explained in the Site Plan Pending Call Indicator and the Site Plan Alarm Indicator.

d. Site Plan Pending Call Indicator

1) When calls are pending from areas other than the current screen, then the area of the call shall flash on the site plan.
2) If both an alarm and a pending call are active at the same time in an area, then the respective area shall flash alternating colors.

e. Site Plan Indicator

1) When alarms are active from areas other than the current screen, then the area of the alarm shall flash on the site plan.
2) If both an alarm and a pending call are active at the same time in an area, then the respective area shall flash alternating colors.

f. Plan Navigation Arrows.

1) Provide arrows on each map as an additional means to navigate through the facility.

9. Alarm Silence and Reset Icons

a. Alarm Silence

1) When an audible alarm annunciation is sounding; touch or left click the Alarm Silence icon.
2) The audio alarm stops.
3) The audio alarm starts again if alarm conditions exist on other screens, or if new alarms are received on the same screen.

b. Alarm Reset

1) Provide the Reset Icon to reset all alarmed icons to normal conditions if they are not of the self-resetting type.
2) Touch or left click the Reset icon when the alarm conditions no longer exist.
3) Reset function shall only operate on those alarms annunciated on the active screen. No global alarm reset icons shall be allowed.

10. Camera Selection

a. Camera Selection via icons

1) In addition to automatic call up, Cameras can be selected via the GUI.
2) Touch or left click the camera icon.
3) Selecting the camera icon causes the icon to change color, and displays the CCTV image on the active monitor.
4) Selecting the same icon a second time disconnects the camera and returns the active monitor to its default scene.
5) Selecting a second camera icon while another camera is active causes the active camera to deactivate and activates the selected camera.
6) Camera selection is to the default "call up" monitor at the touch screen work station. Provide a means of selecting cameras to the overhead monitors by changing from the default monitor to a selected monitor from the tool bar. Only monitors within direct view of a touch screen location shall be selectable from the tool bar.

11. Occurrence Log

a. Entry of New Occurrence Logs

1) User can enter text via the attached keyboard.
2) As characters are selected on the keyboard they should be displayed on the appropriate field.
3) Select the submit button to save the entered text into the SSM computer.
4) After submitted, status should indicate that the text has been sent and saved successfully, and the title and log fields should be cleared. If the text is not sent and saved successfully, the status should indicate "Log Entry Failed", and the title and log fields should not be cleared.
5) Select clear button to clear title and log fields.
6) Select view logbook button to view previous entries within the last 24 hours.
7) Occurrence log entry shall be as illustrated herein.
8) Title field shall be capable of 100 characters.

b. Viewing Previous Entries

1) Shall be capable of viewing 100 logged entries.
2) The retrieval time shall be less than 10 seconds.
3) Select the view log entry button to return to the new occurrence log entry screen.
4) All data is stored on the SSM computer.

12. Elevator Control

a. Car panel will not function under normal operation. All elevator movement will be via remote control from Master Control.
b. The intercom system is used to call the car to a given floor. The Touch Screen is required to emulate the control and indication functions of the car panel.
c. Elevator control icons will be located on the tool bar and will not require a dedicated screen.

d. Interface between the elevator controllers and the PLC system are designed as discrete dry contact relay interface for all control and indication functions.

2.4 GUI CONTROL STATION INDICATOR CONDITONS

A. Door Status - Provide red and gray (or white) animated graphic indicators on the screen at each door to be monitored, to indicate the status of the door. Monitor the Door Position Switch (DPS) and the Latch Bolt Monitor (LBM) switch independently. Secure indication should only be displayed when both switches are in the secure condition. Differentiate between doors that are open, and doors that are closed but unlocked. Alarm is generated for unauthorized opening of doors; doors opened via unlock commands and doors left open too long. Timer for door open too long must be adjustable via supervisor's utility screen.

1. Flashing Red - alarm
2. Red - unsecured
3. Gray or white – secured

B. Utility Status – Provide yellow and gray animated graphic indicators on the screen at each utility location to indicate the utility status.

1. Yellow – Utility On
2. Gray - Utility Off

C. Log In/Out, Satellite GUI Takeover, and GUI Disable – Provide a gray animated graphic indicator that contains the appropriate text.

D. Intercom Control and Inmate Call Disable – Provide green, yellow, and gray animated graphic indicators on the screen at each intercom location, to indicate the intercom status.

1. Flashing Green – Intercom call-in
2. Green – Intercom active
3. Yellow "X" - Intercom call-in isolated
4. Gray – Intercom inactive
5. "Sunken" – Intercom station calls to another master.

E. Alarm Silence and Reset – Provide a gray animated graphic indicator that contains the appropriate text.

F. Camera Selection - Provide a blue green red and gray animated graphic indicator on the screen at each camera location to indicate the camera status.

1. Blue – Camera manually activated and CCTV image displayed on active monitor.
2. Purple – Video follow audio activated and CCTV image displayed on intercom monitor.
3. Red – Video follow alarm activated and CCTV image displayed on alarm monitor.
4. Gray - Camera deactivated.

G. Interlock Status - Provide yellow color indicators at each door in an interlock group.

1. When a door in an interlocked group becomes un-secure, illuminate yellow

indicators on all other doors in the interlock group.
2. VAS shall annunciate that door cannot be unlocked if interlock condition exists (see below)

H. Uninterruptible Power System Alarm and System Trouble Icon

1. UPS Power System Alarm

a. Upon loss of primary AC power, the UPS icon shall appear and begin to flash red “Inverter On”, accompanied by a unique tone.
b. Activating the alarm silence Icon shall silence the tone and cause the Icon to glow steadily. Upon return of primary AC power, activating the alarm reset Icon shall extinguish the red indication and hide the icon.

2. Similar function for Trouble indication. Flashing yellow “UPS Trouble” indication.

I. Duress Alarm/Panic Alarm - Provide red animated graphic indicators on the screen at each duress/panic switch on alarm only. Inactive or “normal” condition of the duress alarms hides the icon in lieu of muting it. Implement video follow alarm for cameras adjacent to duress or panic buttons. Duress or panic alarms with video follow alarm function shall call the camera to the alarm monitor at the associated GUI Operators post.

1. Flashing Red - alarmed
2. Red – acknowledged

J. Provide access to a system status screen with text display of the following:

1. Name of operator logged on to each console
2. List of all pending, silenced, and acknowledged alarms currently indicated through the entire system.

2.5 VOICE ANNUNCIATION SYSTEM

A. Provide a Voice Annunciation System (VAS) as an additional interface between personnel and the computer system. The VAS shall use speech from a stored vocabulary to provide alert and annunciation messages, special direction or information to facility staff in staff areas (intercom speakers) and control rooms. Verify message requirements and locations during Phase-1 software meeting.

1. The VAS shall be entirely electronic, no tapes, and meet the following minimum requirements
2. The VAS shall speak individual words, phrases and sentences in addition to tones.
3. VAS shall provide output to audio amplifiers, speakers and intercom speakers that are also part of system.
4. The VAS shall be selectable between male voice, female voice, and a tone. This shall be selected from the miscellaneous function icons as described above.

2.6 SECURITY SYSTEM MANAGEMENT COMPUTER (SSMC) OPERATIONAL REQUIREMENTS:

A. Specifications

1. The Security System Management Computer (SSMC) shall perform functions including, but not limited to, the following:

    a. Programming of PLC.
    b. PLC system remote diagnostic capabilities.
    c. Recording all security control system transactions and events.
    d. Recording of incident reports.

2. The SSMC shall generate reports of the recorded transactions and events within the system. All data shall be recorded into a database and the SSMC shall have the capability to generate reports through selection of any data field or timeline. The SSMC shall have advanced search capabilities for any combination of data and can search the incident logs independently.

PART 3 - EXECUTION

3.1 SOFTWARE SUPPORT

A. Phase I

1. Provide screen shots. The Trade Contractor shall request, in writing, scheduling of the Phase I meeting within one (1) week of receiving the approved shop drawing submittal. A proposed agenda shall be included with the request. The Phase I meeting shall be held within thirty (30) working days of receiving the approved shop drawing submittal.
2. The purpose of the Phase I meeting is to define the project specific functions and operational procedures of the control system with the Owner & Architect Engineer. The Trade Contractor shall present proposed operational procedures for every function specified in the Contract Documents or recognized as industry standard or convention for a correctional facility Control System. The Trade Contractor will present proposed operational schemes to the Owner & Architect Engineer, and modify those schemes based on the Owner's policies and procedures.
3. The Trade Contractor shall address integration of the components and subsystems making up the control system when presenting the proposed operational procedures. The Trade Contractor shall provide an operating GUI at the Phase I meeting (of an operating facility or this facility) that demonstrates every control and annunciation function described in the specifications to help with Owner's design decisions. This demo shall not include any operational procedures that are not included in the Base Bid for this project. This operating GUI shall demonstrate all data capture and reporting features of the SSMC.
4. The Trade Contractor shall prepare and present 4 sets of color screen drawings at this meeting. As a minimum, these screen drawings shall depict the following:

    a. Overall building layout screen.
    b. Area control screens. (These area screens shall be drawn to represent actual orientation with control officer's view). Different orientation views shall be created per each control post and the control officer's orientation view.
    c. All special control and transition screens. (Utility, Administration, help, etc.)
    d. Each sheet shall be numbered for easy reference.
    e. Actual size to show detail and all text legible.

5. The Trade Contractor shall prepare a detailed report summarizing the operation of all icons. The report is to be submitted for approval by the Owner and Architect Engineer no later than two (2) weeks after the date of the Phase I meeting. The software systems that make up the control system shall be designed specifically from this document.

B. Phase II

1. At least thirty (30) working days prior to the scheduled date for job site delivery of the first control system head end components, the Trade Contractor shall request a Second meeting with the User (maximum of 4 representatives) and the Architect Engineer (2 representatives) at the Trade Contractor's manufacturing facility. The Trade Contractor shall provide a full demonstration of the completed control system with fully functional control software. The Trade Contractor shall provide means to simulate all real world conditions necessary to demonstrate each function and operating procedure agreed to in the Phase 1 meeting. The design and function of the software shall match the exact performance as specified in the revised Phase I report. The Trade Contractor shall be responsible for the cost of travel expenses incurred by the Owner and Architect Engineer representatives for this trip. Travel expenses shall include airfare (if applicable), hotel accommodations, ground transportation, and meals.
2. All performance deviations and necessary changes identified at this meeting shall be documented by the Architect Engineer on a "pre-punch list". The pre-punch list shall be 100% corrected by the Trade Contractor prior to delivering the equipment to the job site.
3. During this time period the Trade Contractor shall perform all shop testing as defined in the approved testing plan.

C. Phase III

1. Immediately following the installation and testing of the control system, the Trade Contractor shall provide a formal demonstration of all systems to the Owner and Architect Engineer that includes all operational elements covered in the Phase II meeting. The Trade Contractor shall work with the Owner, facility personnel and the Architect Engineer to correct any problems or operational deviations from the original Phase I and Phase II design documents. Deficiencies will be identified during the Architect Engineer's punch list inspection, and documented to the Trade Contractor. The Trade Contractor shall perform all hardware and software modifications necessary to correct any problems or operational deviations resulting from engineering, programming or installation services provided by the Trade Contractor.
2. Upon achieving a 100% functional control system as determined by the Architect Engineer, a documented release form provided by the Trade Contractor shall be signed by the Owner, and retained on file with the Architect Engineer. The Trade Contractor shall continue to work on the installed system at no cost to the Owner until the Architect Engineer has determined the Phase I and Phase II documents have been met and the system has been 100% field tested as defined in the approved testing plan, regardless of substantial completion. The system warranty shall begin after the Architect Engineer has verified 100% compliance has been met.

3.2 INSTRUCTION PERIOD

A. Provide the facility personnel with training in the use and maintenance of the entire

control system. The first sessions to be prior to system turnover, the Second at turnover and the third immediately after turnover. Coordinate the training sessions with the Owner. Completed classroom sessions will be documented by the Trade Contractor, certified by the attending Owner representatives, and approved by the Architect Engineer. Instruction shall take place during normal working hours (Monday through Friday, 8:00 a.m. to 5:00 p.m.). Instruction shall not begin until all systems are operational as designed. See section 28 05 00 – Common Work Results For Electronic Security for additional information regarding training.

B. The training sessions shall cover the operation and the maintenance manuals and the control console operators manuals and service manuals in detail, stressing all important operational and service diagnostic information necessary for the maintenance and operations personnel to efficiently use and maintain the control system.

C. Trade Contractor is responsible for providing operational and maintenance training applicable to the entire control system. Training is to include, but not be limited to the following-

1. Review all O+M manuals with Owner's representatives present for training.
2. Perform a tour of the entire facility. During the tour the trainer shall point out all control equipment and provide a brief description of its purpose and use. This is to include but not be limited to touch screen control stations, all control system hardware, and devices controlled.

END OF SECTION 284620

SECTION 285000 - MISCELLANEOUS SYSTEMS FOR ELECTRONIC SECURITY

PART 1 - GENERAL

1.1 SYSTEM DESCRIPTION

A. Furnish all materials and labor necessary to complete the installation of specific systems described herein and integration of all systems as indicated, specified herein or both. The work includes the following, as well as work not listed below but described elsewhere:

1. Door Release Push Button
2. Emergency Door Release Push Button
3. Duress Alarm Push Button, Under Counter
4. Duress Alarm Push Button, Wall Mount

PART 2 - PRODUCTS

2.1 GENERAL

A. Equipment specified is intended as a reference standard for level of quality.

B. Lists of products and manufacturers are Non-restrictive. Submission of an unnamed product or manufacturer does not require a substitution or change to the Contract Documents, but must comply with requirements for “Comparable Products” as outlined in Section 010 60 00 PRODUCT REQUIREMENTS.

C. Provide materials listed by UL or ETL.

2.2 DOOR RELEASE PUSH BUTTON

A. Specifications

1. Desktop Mini Console style similar to Secure Door Controls DT Series.
2. Dry contact
3. Screw terminal connections
4. Provide CAT 5/5e jack and faceplate in wall outlet and a workstation cord for connection to console.

B. Acceptable Manufacturers

1. Security Door Controls 450 series
2. Approved Equal

2.3 EMERGENCY DOOR RELEASE PUSH BUTTON

A. Specifications

1. Push button
2. Dry contact
3. 3 amp contact rating

4. Screw terminal connections
5. Vandal resistant stainless steel single gang plate

B. Acceptable Manufacturers

1. Security Door Controls 450 series.
2. Approved Equal

2.4 DURESS ALARM PUSHBUTTON, WALL MOUNT

A. Specifications

1. Momentary DPDT contacts
2. Switch Rating: 3 Amps at 28VDC

B. Acceptable Manufacturers

1. Ademco – 269.
2. Approved Other

2.5 PANIC ALARM PUSHBUTTON, UNDER COUNTER

A. Specifications

1. Silent, single-push switch, for sending an immediate signal to supervisory personnel.
2. The switching mechanism contains a double-pole, double-throw contact supplied with lock mounted switch and two keys.
3. The switch can be reset only with a key by an authorized person.
4. Mounted to single gang aluminum plate.

B. Acceptable Manufacturers

Bulletin 800 Series/ Allen Bradley with Mushroom Head.

2.6 ELECTRONIC HORN / STROBE

A. Specifications

1. Xenon Strobe Light source with horn
2. Flash rate 60 fpm
3. 100 dB at 1 meter/90dB at 10 ft.
4. Low current Draw
5. Terminals for easy wiring
6. Diode Polarized for use in electrically supervised circuits. (869DSTR)
7. Operating indoor temp range: -31 degree F to 150 degree F

B. Acceptable Manufacturers

1. Edwards Signaling 869STRB-N5

2. Approved Others

2.7 DRIVE UP PEDESTAL

A. Specifications
   1. sized as needed for mounting intercom, and camera, ETC.
   2. 2 x 4 steel tubing construction for base
   3. 8" x 8" base plate
   4. See detail. White powder coat finish

B. Acceptable Manufactures
   1. Engineered Parking Systems
   2. The Housing Company
   3. Approved equal

PART 3 - EXECUTION

3.1 INSTALLATION

A. All system programming shall be done at the contractor's facility prior to installation on site.

B. Qualified personnel shall install the System in strict compliance with manufacturer's instructions.

C. Wiring shall be color coded, uniform and in accordance with national electric codes and manufacturer's instructions.

D. Equipment shall be firmly secured, plumb and level.

E. All cable runs to the main equipment rack shall be tagged and identified.

F. Coordinate all work with other trades and Contractors.

G. Grounding of devices and peripheral equipment shall be installed per manufacturer's direction to eliminate noise induction and achieve optimum system performance.

H. Install and configure Security local area network as required for control and communication between system devices. When required, provide necessary coordination, termination, and programming associated with integrating Security local area network with facility network.

I. Equipment cabinets shall be assembled in the Contractor's shop prior to delivery to the job site.

3.2 SOFTWARE SUPPORT

A. Refer to Section 284620 for software support and programming requirements.

3.3 SYSTEM INITIALIZING AND PROGRAMMING

A. All programming shall occur in the Contractor's shop prior to installation on site.

B. The System shall be turned on and adjustment made to meet requirements of the specification and on-site conditions.

C. The System shall be programmed to function as specified.

D. Any special programming shall be documented and a written copy given to the Owner/User.

E. Coordinate integration of other electronic systems as called for in the contract documents.

3.4 SYSTEM TEST PROCEDURES

A. The System shall be completely tested to assure that all components are hooked up and in working order.

B. The System shall be pre-tested by the security equipment contractor and certified, in writing, to function in accordance with the plans and specification.

C. The contractor is to verify the system is communicating with all controlled devices.

3.5 FIELD QUALITY CONTROL

A. Provide services of a duly factory authorized service representative for this project location to supervise the field assembly and connection of components and the pre-testing, testing, and adjustment of the system.

B. Make observations to verify that units and controls are properly labeled, and interconnecting wires and terminals are identified. Provide a list of final tap settings of paging speaker line matching transformers.

C. Rectify deficiencies indicated by tests and completely re-test work affected by such deficiencies at Contractor's expense. Verify by the system test that the total system meets the Specifications and complies with applicable standards.

END OF SECTION 285000

SECTION 285123 - INTEGRATED INTERCOM/PAGING SYSTEM FOR ELECTRONIC SECURITY

PART 1 - GENERAL

1.1 SYSTEM DESCRIPTION

A. Furnish all materials and labor necessary to complete the installation of specific systems described herein and integration of all systems as indicated, specified herein or both. The work includes the following, as well as work not listed below but described elsewhere:

B. Provide Intercom System that meets the following functional requirements

1. The purpose of the intercom system shall be to provide clear, two-way, remote reply intercommunication between intercom master stations and remote intercom substations.
2. System shall also accommodate zoned overhead paging to the areas identified throughout the facility with talk back capabilities provided. Source input is limited to the intercom push to talk master stations at the various control consoles.
3. The extent, size, locations, and layout of the various systems shall be shown on the plans.
4. The system is configured to allow for visual and audible notification to the operator of intercom call in and active intercom channels on the graphical user interface associated with each control console.
5. Intercom substations shall be programmed to call a designated master based on the location of the station and the area of influence for each control console.
6. System shall be capable of audio monitoring and of initiating an alarm when the voice being monitored at a certain location exceeds preset audio parameters.
7. The intercom/paging system shall be a major sub-system of the overall integrated control system. Controlling the system, selecting stations, and integration with other sub-systems shall be accomplished through a communications interface (Ethernet) to the graphical user interface.
8. Paging system shall be capable of routing to individual or groups of defined speaker zones. All call paging is also required.
9. Manufacturer-approved personnel shall perform installation and maintenance.

C. System Configuration

1. Microprocessor based, network centric controllers and expanders are required. Controllers and expanders shall support 2 master stations each and be capable of fully independent talk paths for each.
2. Ethernet communications and a separate audio trunk shall provide the capability to network individual exchanges with each other creating an integrated system. Transfer of station call between exchanges shall be accommodated via the network.
3. Standard 25-volt output amplifiers shall provide audio power to IC stations.
4. Tamper resistant substations shall be flush mounted as shown on the drawings or specified.
5. Intercom master stations are required for control locations. Connection of the master stations shall be via Ethernet.
6. Controller software shall allow for individual level control, sensitivity, and equalization of each station.

7. Intercom system shall interface with video surveillance system via Ethernet and vendor specific API programming
8. When intercom station talk path is established, the video surveillance system shall display image of the nearest camera on call up monitor associated with the console establishing the talk path.
9. The ability to suspend a station's capability to call in shall be provided via integration with the graphical user interface shall be provided. This ability is necessary to prevent inmates from harassing console operators with continuous calls.
10. Console master stations shall be capable of listening to intercom stations or talk back page zones without privacy tones announcing that a console is listening.
11. Pages shall originate from the various consoles and shall include talkback capabilities.

PART 2 - PRODUCTS

2.1 GENERAL

A. Equipment specified is intended as a reference standard for level of quality.

B. Lists of products and manufacturers are Non-restrictive. Submission of an unnamed product or manufacturer does not require a substitution or change to the Contract Documents, but must comply with requirements for "Comparable Products" as outlined in Section 010 60 00 PRODUCT REQUIREMENTS.

C. Provide materials listed by UL or ETL.

D. Basis of Design

1. Drawings and specifications included in these contract documents are based on the Harding Instruments DXL product.
2. Equal by Stentofon is acceptable
3. All other manufacturer's products must be submitted for approval per 2.1.B above

2.2 DIGITAL COMMUNICATION CONTROLLERS (DCC's)

A. Specifications

1. Digital Communication Controllers to each from an intercom exchange capable of independent local operation. Exchange capacity to be increased by connecting up to four Digital Communication Expanders to each DCC.
2. Multiple DCC's to be networked together via digital audio trunks and Ethernet data networks to form the larger system. VoIP enabled systems shall utilize IEEE 802.1p/Q Quality of Service (QoS) compliant Ethernet networking equipment.
3. Each DCC to include:

    a. a Process Control Card (PCC)
    b. a Master Control Card (MCC)
    c. two Station Control Cards (SCCs)
    d. an internal PCI card (Lonworks or VoIP accelerator card)
    e. a front panel keypad/display for system setup and maintenance.
    f. a 110 VAC, 60 Hz power supply for internal functions.

4. Process Control Card:

    a. Process Control Card to contain system configuration and data, control exchange operations and switching, and provide exchange network ports.
    b. Process Control Card to include:

        1) USB network ports for exchange expansion.
        2) Ethernet network ports for system expansion and external control by touch screen computers and graphic control panels.
        3) Fiber optic or copper digital audio trunk ports. (not required for VoIP over Ethernet audio trunking)
        4) Two serial ports.
        5) An internal modem for transmitting and receiving data over a telephone line.

5. Master Control Cards:

    a. Include ports for any combination of two intercom or telephone set master stations.
    b. Include two line level audio inputs with status and control.
    c. Include two line level audio outputs with status and control.
    d. Convert incoming audio signals to digital format and outgoing signals to analog format.
    e. Intercom master station audio, press-to-talk and hook switch status transmitted over two single shielded pair cables with wiring supervision to detect open circuit and short circuit faults.
    f. Telephone set master station functions transmitted over a single wiring pair.

6. Station Control Cards:

    a. Each provides sixteen half-duplex intercom station ports which can be employed in adjacent pairs for full duplex devices.
    b. Provide an interface for intercom stations. Units to convert incoming audio signals to digital format and outgoing signals to analog format. Each channel to monitor the status of up to two (2) switches associated with each intercom station.
    c. Each card interfaces with 16 half-duplex channels. Each channel includes a separate audio power amplifier for non-blocking call operation and sixteen (16) independent software controlled volume settings.
    d. All station audio, switch, and power functions on 400-Series and 401-Series cards to be transmitted over a single shielded pair cable with supervision to detect open circuit and short circuit faults.
    e. Audio and switch functions on 300 Series (Generic Intercom) station control cards to be transmitted on separate wiring pairs.

B. Acceptable Manufacturers
    1. Harding

2.3 DIGITAL COMMUNICATION EXPANDERS (DCE's)

A. Digital Communication Expanders to provide master station and intercom features similar to the DCCs to facilitate exchange expansion.

B. Each DCE to include:

1. A Process Control Card (PCC) without exchange control or network functions.
2. A Master Control Card (MCC)
3. Two Station Control Cards (SCCs)
4. A 110 VAC, 60 Hz power supply for internal functions.

2.4 TALKBACK EXPANDERS (TBEs)

A. Talkback Expanders to provide 8 amplified paging outputs that can drive 25 Vrms loudspeaker circuits.

B. Each TBE is to;

1. Provide 5 watts output per channel
2. Allow adjacent channels to be bridged to obtain higher power.
3. Provide talkback capability on all channels.
4. Include Audio Level Alarm capability on all channels.

2.5 PAGE ZONE EXPANDERS (PZEs)

A. Page Zone Expanders to provide 3 page inputs (from an audio amplifier) with each input having 6 selectable relay controlled outputs

B. Each PZE input to include

1. 1 relay controlled output for each input that can be used to key an audio amplifier.

2.6 ADMINISTRATOR SOFTWARE

A. Administrator Software to function on a standard PC to support system configuration, diagnostics, maintenance, and logging but not be required for system operation.

B. Administrator Software to employ Windows features including views of system tree structure, tables of devices, screens for system settings and adjustments, and tables of operational data.

C. Configuration features to include:

1. Creation of overall system architecture.
2. Creation of multiple device templates.
3. Copy and paste functions with auto-numbering and auto-assignment to create device schedules.
4. Configuration error detection and alerts.
5. Device naming and call routing functions.
6. Device setting and performance functions.

D. Diagnostic and Maintenance features to include:

1. Verification of system configuration and installation.

2. Verification of system networks.
3. Verification of device connections.
4. Verification of system operation.
5. Diagnostics via modem or Ethernet ports.

E. Logging features to include:

1. Display of system activity with filtering options.
2. Search by time and date.
3. Search by device.
4. Search by parameter.

2.7 TOUCHSCREEN CONSOLE INTERCOM MASTER STATION PTT MICROPHONES

A. Desktop intercom master stations in cast aluminum housing

B. Dynamic, cardioid polar pattern

C. Lockable push to talk button

D. Dual input impedance settings; 19 to 300 ohms and high impedance

E. 60 Hz to 11kHz frequency response

F. 4 conductor shielded un-terminated line cord for connection to master audio interface

G. Control, station selection and other necessary functions on the integrated master station shall be accomplished via the touch screen.

H. Talk back audio and annunciation queues for the intercom system shall be routed through the touch screen console speaker. See section 284619 – PLC Hardware For Electronic Security.

I. Basis of design for the desk top push to talk microphone is the Shure 522

2.8 VoIP MASTER AUDIO INTERFACE MODULE

A. External master audio interface module to consist of:
1. Network and power supply interface, audio amplification and processing module, network and operating status LED's, ribbon cable header for connection to display module.
2. External microphone interface with phantom power capability.
3. External loudspeaker interface.
4. Telephone handset with press-to-talk switch interface.
5. Headset jack interface.
6. External buzzer contact closure interface.
7. Surface wall mount enclosure nominally 9" H x 6.5" W x 1.8" D.

2.9 ANALOG INTERCOM STATIONS

A. Intercom stations are to be designed for mounting on standard 2-gang back boxes. Faceplates to be constructed of 11-gauge brushed stainless. Internal steel offset grille to restrict inserting objects through speaker grille. Stations to be ruggedly constructed and resistant to damage from soil and sprays.

B. Each intercom station is to incorporate an internal loudspeaker, microphone preamplifier and function multiplexing circuitry. One pushbutton is to be provided on each station. Pushbutton to be software assignable for placement of call request.

C. Pushbuttons to be vandal resistant and of stainless steel. Switch to have positive tactile action with 1 million-operation lifetime. (*Pushbuttons to be solid metal piezo-electric type with no moving parts and a 50 million operation lifetime*).

D. Loudspeakers to be waterproof mylar cone type.

E. All intercom station functions to be transmitted over a single shielded pair cable. Stations to be provided with MTA type insulation displacement connector that requires no wire stripping for installation.

F. Outdoor intercom stations are to be identical in all respects to standard intercom stations except that all metal plates and hardware to be stainless steel, and internal circuitry and components to be conformally coated.

2.10 PAGING AMPLIFIERS

A. Provide paging amplifiers and zone switching as required to perform the functions described herein and indicated on the drawings.

B. Paging amplifiers to be the constant voltage output type with power output capacities to drive the loudspeakers connected at sufficient levels with no more than 90% amplifier loading.

2.11 WIRE AND CABLE

A. Factory manufactured field interface cables to be provided, as required, for all:

1. CBL-MST-A male DB-15 connector with 6 individually shielded twisted pairs for connecting to master station ports.
2. CBL-STN-A male DB-37 connector at one end with 16 individually shielded twisted pairs for connecting from station control card audio port to terminal blocks.
3. CBL-STQ-A with male DB-37 connectors at both ends and with 16 individually shielded twisted pairs. For connecting from station control card audio ports to QCB-120-1 Quick Connect Board.
4. CBL-SWT-A male DB-25 connector at one end with 16 individually unshielded twisted pairs for connecting from SCC- 300 station control card switch port to a terminal block.
5. CBL-SWQ-A with male DB-37 connectors at both ends and with 16 unshielded twisted pairs. For connecting from SCC- 300 station control card switch port to QCB-120-2 Quick Connect Board.

B. Field wiring to conform to manufacturer's recommendations.

2.12 QUICK CONNECT BOARDS

A. Quick Connect Boards are designed with a female DB connector to connect a cable from the station control card ports to screw clamp terminals that terminate the field wiring.

1. QCB-120-1 connects the audio port of either the SCC-300 or SCC-400/401 station control card to the field wiring.
2. QCB-120-2 connects the switch ports of an SCC-300 station control card to the field wiring.

2.13 STATION PORT ADAPTER

A. Station Port Adapter provides a line-level output for use with external paging amplifiers.

1. Provides a single line-level output.
2. Provides a single control output (when connected to a 400 or 401 series station card audio port).
3. Screw terminal connections.

2.14 RECESSED CEILING PAGING SPEAKERS, NON-DETENTION AREAS

A. Specifications

1. Speaker
   a. Continuous Power Rating: 25 watts
   b. Frequency: 110 - 20KHz
   c. Impedance: 8 ohms
   d. Sensitivity: 88 dB, Avg./ 92 dB, Peak
   e. Coaxial: ½' post mounted domed tweeter, 4 inch paper cone speaker with poly ether foam surround and a 10 oz magnet.
2. Transformer
   a. Primary Voltage: 70.7 volts
   b. Frequency Response: +/- 1 dB, 50-15 kHz
   c. Primary Taps: 1, 2, 4, and 8 watts
   d. Secondary Impedance: 4 and 8 ohms
   e. Insertion Loss: .6 dB
3. Back Box
   a. Enclosure Diameter: 5-3/8"
   b. Enclosure Depth: 7-5/8"
   c. Flange Diameter: 7-9/16"
   d. Internal Volume: .1 cubic feet
   e. Tile Bridge: 24 gauge electro-galvanized steel
4. Baffle: Perforated steel with welded/serrated studs for push on installation

B. Acceptable Manufacturers

1. Lowell SQLK-8L
2. Soundolier

3. Approved equal

C. Package to include speaker, back box enclosure, baffle, and tilebridge.

2.15 RECESSED CEILING PAGING SPEAKERS, DETENTION AREAS

A. Specifications

1. Speaker
   a. Continuous Power Rating: 25 watts
   b. Frequency: 110 - 20KHz
   c. Impedance: 8 ohms
   d. Sensitivity: 88 dB, Avg./ 92 dB, Peak
   e. Coaxial: ½' post mounted domed tweeter, 4 inch paper cone speaker with poly-ether foam surround and a 10 oz magnet.
2. Transformer
   a. Primary Voltage: 70.7 volts
   b. Frequency Response: +/- 1 dB, 50-15 kHz
   c. Primary Taps: 1, 2, 4, and 8 watts
   d. Secondary Impedance: 4 and 8 ohms
   e. Insertion Loss: 0.6 dB
3. Back Box
   a. Enclosure Diameter: 5-3/8”
   b. Enclosure Depth: 7-5/8”
   c. Flange Diameter: 7-9/16”
   d. Internal Volume: 0.1 cubic feet
   e. Tile Bridge: 24 gauge electro-galvanized steel
4. Baffle: Atlas VP-161 or equal

B. Acceptable Manufacturers

1. Atlas Sound FAP42T Strategy Series II speaker system package.
2. Lowell

C. Package to include speaker, back box enclosure and baffle.

2.16 SURFACE MOUNT PAGING SPEAKER, NON-DETENTION AREAS

A. Specifications

1. Power Rating: 25 watts (transformer limited)
2. Tap Settings: 70V .25, .5, 1, 2, and 4 watts
3. Frequency Response: 85 Hz – 20 k Hz
4. Sensitivity: 92 dB 1W/1M
5. Cone: 8” dual cone
6. Magnet: 10 oz.
7. Dimensions: 11 ½” x 11 ½” x 5 ½”
8. Assembly: CRS constructed enclosure
9. Provide with steel cage for protection.

B. Acceptable Manufacturer

1. Atlas Sound SBMS series speaker system.
2. Lowell

C. Typical of locations where page speaker is mounted to exposed structure.

2.17 WALL MOUNT PAGE SPEAKER, NON-DETENTION AREAS

A. Specifications

1.	Power Taps:	1, 2, 3.8, 7.5, 15 watts at 70V
2.	Frequency Response:	400 Hz to 14 kHz
3.	Dispersion:	70 degrees
4.	Sensitivity:	106 dB
5.	Power Rating:	15 watts

B. Acceptable Manufacturer

1. Atlas Sound AP-15T loudspeaker.
2. Lowell

2.18 SURFACE MOUNT VANDAL PROOF CEILING SPEAKER, DETENTION AREA

A. Specifications

1.	Speaker Type:	8” dual cone
2.	Magnet Weight:	10 oz
3.	Sensitivity:	97 dB
4.	Frequency Response:	65 Hz to 20 kHz
5.	Insertion Loss:	1.5 db
6.	Transformer:	25/70 volt
7.	Primary Taps:	.25, .5, 1, 2, 5
8.	Provide with steel cage for protection.	

B. Acceptable Manufacturer

1. Atlas Sound SD72 speaker transformer package with VP161A-R8 recessed square baffle and 161SES surface stainless steel enclosure.
2. Lowell

PART 3 - EXECUTION

3.1 INSTALLATION

A. All system programming shall be done at the Trade Contractor’s facility prior to installation on site.

B. Qualified personnel shall install the System in strict compliance with the manufacturer's instructions.

C. Wiring shall be color coded, uniform, and in accordance with national electric codes and manufacturer's instructions.

D. Equipment shall be firmly secured, plumb, and level.

E. All cable runs to the main equipment rack shall be tagged and identified.

F. Coordinate all work with Construction Manager – Avisor and other Trades Contractors.

G. Grounding of cables and peripheral equipment shall be installed per manufacturer's direction to eliminate noise induction and achieve optimum system performance.

H. Install and configure Security local area network as required for control and communication between system devices. When required, provide necessary coordination, termination, and programming associated with integrating Security local area network with facility network.

I. Equipment cabinets shall be assembled in the Trade Contractors shop prior to delivery to the job site.

J. All cabling shall be continuous between field device and equipment cabinet. Terminations shall be to terminal boards with punch down blocks, or on screw terminals. Twisted and taped splices are unacceptable.

K. Carefully match input and output impedance's and signal levels at signal interfaces. Provide matching networks where required.

3.2 SOFTWARE SUPPORT

A. Refer to Section 284620 – PLC Software For Electronic Security for software support and programming requirements.

3.3 SYSTEM INITIALIZING AND PROGRAMMING

A. All programming shall occur in the Trade Contractor's shop prior to installation on site.

B. The System shall be turned on and adjustment made to meet requirements of the specification and on-site conditions.

C. The System shall be programmed to function as specified.

D. Any special programming shall be documented and a written copy given to the Owner.

E. Coordinate integration of other electronic systems as called for in the contract documents.

3.4 SYSTEM TEST PROCEDURES

A. The System shall be completely tested to assure that all components are hooked up and in working order. The System shall be adjusted for optimum intelligibility at peak amplifier output before audio signal clipping occurs. Inspect communications quality between each remote device and master station for buzzes, rattles and audio distortion. Correct all causes of such defects. If the cause is outside of the intercom system, promptly notify the Architect Engineer in writing, indicating the cause of the defect and suggested corrective procedures.

B. The System shall be pre-tested by the Security Equipment Trade Contractor and certified, in writing, to function in accordance with the plans and specification.

C. The Trade Contractor is to verify the system is communicating with all controlled devices.

D. Testing to be performed in the Trade Contractors shop prior to delivery-
1. Test 120VAC power equipment and hardware internal to all equipment racks. Test all conductors for shorts, opens, and polarity.
2. Fully charge all UPS systems that apply to this system. Test unit by removing power thereby causing the unit to switch to battery reserve.
3. Perform impedance sweeps on all speakers. Verify results fall within manufacturer's specifications.
4. Adjust all source level control components and signal processing for optimal gain structure. All components shall be set so they clip simultaneously.

E. Testing to be performed at the job site prior to powering the system

1. Verify correct polarity of all microphone inputs, line level inputs, and speaker cables.
2. Verify all microphone inputs, line level inputs, and speaker cables are free of shorts and opens prior to termination of head end electronics.
3. Repeat impedance sweeps on all speaker systems after they are installed and terminated. Include speaker cable in testing.
4. Test all 120VAC power sources for correct polarity and voltage. Test grounding system for continuity. Notify the Construction Manager – Advisor and Electrical Trade Contractor of any problems.

F. Additional job site testing

1. After installation of head end electronics, verify polarity of signal throughout system.
2. Finalize gain structure of system. Adjust system gain and level so that all components clip at the same time. Adjust so system noise is minimized.
3. Adjust all speaker components for consistency in sound pressure level.

G. Prior to termination of head-end electronics, verify that all speaker lines are free from shorts and opens.

H. Utilizing an impedance meter run test tone through speaker system verifying that all speakers are functioning properly.

I. Terminate head end electronics. Run test tone through system verifying adequate gain structure through electronic signal path.

J. Using a sound level meter, confirm variation in sound pressure level is not more than +/-5 db in all areas. Adjust speaker taps to insure consistency in sound pressure levels throughout the facility.

K. Adjust overall sound pressure level so minimum level is 10 dB above ambient noise level for facility during normal operating conditions.

L. The System shall be completely tested to assure that all components are hooked up and in working order. The System shall be adjusted for optimum intelligibility at peak amplifier output before audio signal clipping occurs. Inspect system for defects. Correct all causes of such defects. If the cause is outside of the scope of the Div 28 series scope of work, promptly notify the Construction Manager – Advisor and the Architect Engineer in writing, indicating the cause of the defect and suggested corrective procedures.

M. The system shall be capable of operating free of hums, buzzes, and rattles under normal operating conditions.

N. Provide written documentation showing all test results.

O. The System shall be final tested in the presence of the Architect Engineer. Trade Contractor is to provide all required testing equipment.

3.5 FIELD QUALITY CONTROL

A. Provide services of a duly factory authorized service representative for this project location to supervise the field assembly and connection of components and the pre-testing, testing, and adjustment of the system.

B. Make observations to verify that units and controls are properly labeled, and interconnecting wires and terminals are identified. Provide a list of final tap settings of paging speaker line matching transformers.

C. Rectify deficiencies indicated by tests and completely re-test work affected by such deficiencies at Trade Contractor's expense. Verify by the system test that the total system meets the Specifications and complies with applicable standards.

3.6 OCCUPANCY ADJUSTMENTS

A. When requested by the Architect Engineer within one year of date of Substantial Completion, provide on-site assistance in adjusting sound levels, resetting matching transformer taps, and adjusting controls to suit actual occupied conditions. Provide up to three (3) visits to the site for this purpose.

3.7 TRAINING

A. Trade Contractor is responsible for providing operational and maintenance training applicable to the entire control system. Training is to include, but not be limited to the following-

1. Review all O+M manuals with Owner’s representatives present for training. Provide Owner with electronic manuals (2 discs).

2. Perform a tour of the entire facility. During the tour the trainer shall point out all intercom/page equipment and provide a brief description of its purpose and use. This is to include but not be limited to intercom substations, intercom master stations, paging speakers, equipment cabinets, and graphic control panels.

3. Typical of graphical user interface consoles-

   a. Demonstrate basic functionality of console.
   b. Demonstrate devices/systems controlled by console.
   c. Review navigation of console screens.
   d. Review control functions of each type.

4. Typical of desktop push to talk microphones-

   a. Demonstrate basic functionality of microphone.
   b. Demonstrate devices/systems associated with microphone.
   c. Review control functions of all push buttons.

5. Explain functionality and operation of integrated systems-

   a. Video follow audio
   b. Answer and zoon, answer no zoom, queuing, etc.

END OF SECTION 285123

SECTION 31 11 00 – CLEARING AND GRUBBING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 – General Requirements Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes the work required for the clearing and grubbing of the site.

B. Related Requirements:

1. Section 31 20 00 – Earth Moving.
2. Section 31 25 00 – Erosion and Sediment Control.

1.3 DEFINITIONS

A. Topsoil: A friable loam surface soil free of subsoil, clay, lumps, weeds, roots, debris, and stones exceeding one inch in any dimension.

1.4 PRECONSTRUCTION CONFERENCE

A. Preconstruction Conference: Conduct conference at Project site.

1. Review methods and procedures related to clearing and grubbing including, but not limited to, the following:

a. Review methodology of clearing and grubbing..
b. Review disposal methods of any wastes/excess materials generated from clearing and grubbing operations.

PART 2 - PRODUCTS (Not used)

PART 3 - EXECUTION

3.1 EXISTING VEGETATION

A. Avoid cutting vegetation outside limits of disturbance area shown on the plans.

3.2 EXISTING UTILITIES

A. Existing utilities are indicated in accordance with available records. Drawings may not represent all utilities that may be encountered or exact locations of utilities known.

B. Before any work is started, contact corporations, companies, individuals, and local authorities owning, maintaining, or regulating conduits, wires, and pipes running to or on the property to make suitable arrangements for handling and disposal of such lines.

C. Maintain existing utilities and structures indicated to remain, keep in service, and protect against damage during demolition operations.

D. Do not interrupt existing utilities serving occupied or used facilities, except when authorized in writing by authorities having jurisdiction. Provide temporary services during interruptions to existing utilities, as acceptable to governing authorities.

3.3 WASTE/EXCESS MATERIAL DISPOSAL

A. Promptly dispose of waste materials from clearing, grubbing and leftover stockpiles. The waste disposal shall conform to applicable laws, ordinances, rules and regulations. Do not consider work completed until final cleaning, unless otherwise directed.

B. Transport waste materials from the project site to off-site disposal areas.

C. No burning of combustible waste materials is permitted.

END OF SECTION 31 11 00

SECTION 31 20 00 – EARTH MOVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 – General Requirements Specification Sections, apply to this Section.

B. City of Baltimore: Department of Public Works – *Specifications For Materials, Highways, Bridges, Utilities, and Incidental Structures* with all addenda thereto at the time bids are received (DPW Standard Specifications.) Subsections of DPW Standard Specifications describing "Measurement and Payment" shall not apply to this contract.

C. City of Baltimore: Department of Transportation – *Book of Standards* with all addenda thereto at the time bids are received (DOT Standards.) Subsections of DOT Standards describing "Measurement and Payment" shall not apply to this contract.

D. American Society of Testing and Materials International (ASTM) standards and test methods.

E. All work must comply with Maryland Department of Environment 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control with all addenda thereto at the time bids are received.

1.2 SUMMARY

A. Section includes specifications of materials, equipment, and work required to perform earthwork and grading operations.

B. Related Requirements:

1. Division 01 – General Requirements.
2. Section 02 30 00 – Subsurface Investigation.
3. Division 26 – Electrical.
4. Section 31 11 00 – Clearing and Grubbing.
5. Division 32 – Exterior Improvements.
6. Section 32 90 00 – Plants.
7. Section 32 92 00 – Turf and Grasses.
8. Section 33 10 00 – Water Utilities.
9. Section 33 31 00 – Sanitary Sewer Utilities.
10. Section 33 40 00 – Storm Drain Utilities.

1.3 DEFINITIONS

A. Over-Excavation: Removal of material, beyond sub-grade elevations indicated or specified, without written authorization from the Agency Construction Manager.

B. Unsuitable Materials: Materials located at or below the limits of excavation indicated or specified by the contract documents, which would be detrimental to the proposed construction as determined by the Contractor's Construction Inspection Firm, the State's Construction Inspection and Testing Firm, and the Agency Construction Manager (e.g., peat, muck, organic soils, extremely soft soils, debris, concrete foundations, slabs, walls or other deleterious substances.) In-situ materials with moisture content two percent (2 %) above or below the optimum moisture content for compaction are unsuitable without further moisture conditioning.

C. Fill Materials: Approved materials meeting the criteria specified herein, placed over sub-grade surfaces within the areas and to the elevations indicated or specified.

D. Rock: Material that can be excavated only by air-activated hammers, as directed by the Agency Construction Manager.

E. Settlement Monitoring: Activities, actions procedures and installation of instrumentation performed before and during execution of the Work to monitor and detect movement of ground surfaces, utilities, buildings and structures.

1.4 SUBMITTALS:

A. Provide submittals in compliance with Conditions of contract and Division 01.

B. Product Certificates:

1. Submit certificates, signed by manufacturer and contractor, stating the following fill materials comply with this specification:

   a. Off-site and on-site Structural Fill Material.
   b. Off-site Porous Fill Material.
   c. Off-site Aggregate Fill Material.

2. Submit samples of the following to the Contractor's Construction Inspection and Testing Firm as well as State's Construction Inspection and Testing Firm:

   a. All materials to be used as Structural Fill, Porous Fill, and/or Aggregate Fill.

      1) Sample size: 50 Pounds.
      2) Number of Samples: 1 for each type of material.

3. Submit analysis of materials to be used as Structural Fill, Porous Fill and Aggregate Fill.

C. Settlement Monitoring Program:

1. Submit for review prior to construction, the monitoring program that includes schedule of instrumentation design, layout of instrumentation items, equipment installation details, and monitoring report forms.
2. Provide preconstruction and post-construction assessment reports for structures located within 25 feet of excavations, measured in plan. Include photographs or video of any existing damage to structures in assessment reports.
   Submit settlement monitoring plan for review prior to construction. Identify location of settlement monitoring points, reference benchmarks, survey frequency and procedures, and reporting formats on plan or report.

3. Submit readings of monitoring to State's Construction Inspection and Testing Firm and Agency Construction Manager as soon as readings have been taken.

D. Underpinning:

1. Provide drawings and calculations as necessary to support the design and installation of underpinned utilities and foundations.

1.5 QUALITY CONTROL:

A. Laboratory tests to determine maximum density and field tests to measure in place density of materials will be performed by the Contractor's Construction Inspection and Testing Firm. Tests performed by the Contractor's Construction Inspection and Testing Firm do not relieve the contractor of his responsibility to provide quality control.

B. Suitability of materials for use in backfills and structure fills shall be determined by Contractor's Construction Inspection and Testing Firm.

C. Location of tests shall be mutually acceptable between the representative of the Contractor's Construction Inspection and Testing Firm and State's Construction Inspection and Testing Firm.

D. In the event compacted material does not meet specified in-place density, recompact material and retest this area until specified results are obtained. In the event, if the material itself is unsatisfactory, or if additional rolling or other means fail to produce satisfactory results, remove material in that area down to a level of satisfactory density. Perform removal, replacement, and re-rolling without additional compensation.

E. Allow for shrinkage, provide an excess of at least one percent of total height of Backfill measured from a stripped surface to top of a finished surface or as directed by Agency Construction Manager.

F. Tolerances:

1. Construct finished surfaces, except pavement sub-grades to plus or minus 0.1 foot of elevation indicated or specified by the contract documents.
2. Construct pavement sub-grades to plus or minus 1/4-inch of sub-grade elevations indicated or specified by the contract documents.
3. Complete fill and backfill edges to plus or minus 6 inches of the slope lines indicated or specified by the contract documents.
4. Provide Agency Construction Manager with adequate survey information to verify compliance with the above tolerances.
5. Maintain moisture content of fill material within plus/minus 2 percent of optimum moisture content.

1.6 PROJECT CONDITIONS:

A. Existing Sub-surface Conditions:

1. A sub-surface investigation was conducted at the Project site to determine general sub-surface conditions.
2. The State/Architect/Engineer will not be responsible for interpretations or assumptions made from this information.

a. All sub-surface investigation data are made available only for the Contractor's convenience.

B. Existing Utilities:

1. All existing utilities locations shown on the plans are approximate. Other unknown utilities will likely be encountered.

1.7 CONSTRUCTION SURVEYS:

A. See Division 01.

B. Provide combined horizontal and vertical alignment stakes required to perform earth moving operations to sub-grade elevations indicated or specified, to the tolerance specified.

PART 2 - PRODUCTS

2.1 FILL MATERIALS:

A. General: Material shall be free of frozen matter, debris, muck, peat, roots, grass, leaves, humus, sewage, and other organic material.

1. Obtain and transport fill material to the project site at no increase to the Contract Sum.
2. Submit fill material samples specified.

a. Sample Testing: By the Contractor’s Construction Inspection and Testing Firm.
b. Sample Approval: By the State’s Construction Inspection and Testing Firm and Agency Construction Manager.
c. Do not place fill until approval is obtained from the State’s Construction Inspection and Testing Firm and Agency Construction Manager.
d. Submit samples of each type of material to be used as Fill.
e. Blast furnace slag is prohibited.

B. Structural Fill:

1. Classifications Permitted: GW, GM, GP, GC, SW, SP, SM or SC classified in accordance with ASTM D 2487.
2. Fines Plasticity Index: Not to exceed 10.
3. Liquid Limit: Not to exceed 30.
4. Maximum Dry Density: Not less than 120 pounds per cubic foot determined in accordance with ASTM D 1557 method of testing.
5. Maximum Particle Size: 2 inches.
6. Quality: Free of debris, topsoil, waste materials, muck, organic matter, cobbles, boulders and frozen matter. All materials that fall within the USCS type ML, CL, CL-ML, OL, MH, CH and PT are prohibited for use as Structural Fill.

C. Porous Fill:

1. Coarse Aggregate: ASTM C 33, Size number: #57 aggregate.

D. Aggregate Fill:

1. Crusher Run Aggregate CR-6 defined in DPW Standard Specification Section 32 11 23.10: Table A.

PART 3 EXECUTION

3.1 PROTECTION AND RESTORATION:

A. General:

1. Provide protection to prevent settlement, movement, undermining of, or erosion to, new or existing site improvements, buildings, or utilities.
2. Do not permit heavy equipment to pass over any utility until a minimum of 2 feet of compacted fill or backfill is placed above the top of the utility.
3. Restore damage resulting from lack of protection or improper installation of protection, at no increase to the Contract Sum.

a. Restoration: Approved by the Agency Construction Manager.

B. Existing Utilities:

1. Notify all public utilities 48 hours, excluding weekends and holidays prior to start of earthwork operations. Call Miss Utility (800) 257-7777. The contractor shall pay for services performed by Miss Utility. Should the Contractor require services of any other private company or agency to locate the underground utilities, the Contractor shall pay for those services, without an increase to the Contract Sum.
2. Verify and mark horizontal utility locations prior to start of earthwork operations.
3. Manually excavate and expose utilities as earthwork operations approach marked utility locations at no increase to the Contract Sum.
4. Immediately notify the Agency Construction Manager in the event horizontal or vertical utility locations differ from locations indicated.

a. Provide horizontal and vertical details of differing utility locations as directed by the Agency Construction Manager.
b. Conflicts with proposed construction will be resolved by Agency Construction Manager.
c. The Agency Construction Manager will provide directions and details required to relocate utilities conflicting with construction.

5. Immediately notify the Agency Construction Manager in the event uncharted utilities are encountered during earthwork or subsequent construction operations.

a. Stop all construction operations within immediate area of the uncharted utility.
b. Provide horizontal and vertical details of the uncharted utility locations as directed by the Agency Construction Manager.
c. Conflicts with proposed construction will be resolved by the Agency Construction Manager.
d. Uncharted utilities, not conflicting with construction, are to remain.

6. Protect existing utilities from damage by earthwork or subsequent construction operations.

    a. The Contractor shall restore any utility damaged from any cause at no increase to the Contract Sum.

        1) Restoration will be performed and completed to the satisfaction of the Agency Construction Manager and the utility Owner.

C. Sub-grades:

1. Protect foundation, slab, and pavement sub-grades from saturation by preventing the accumulation of rainwater.
2. Protect foundation and slab sub-grades from frost with the use of insulating materials.
3. Restore sub-grades damaged from lack of protection as directed by the Agency Construction Manager at no increase to the Contract Sum.

D. Support Systems:

1. Provide support systems (e.g., Sheeting, Shoring, Sheet Piling, Cribbing, etc.) at no increase to the Contract Sum.
2. Underpin existing building foundations as indicated or specified by the Contract Documents to protect existing buildings from damage by any construction operations of this project.

    a. Prepare drawings and calculations as necessary to support the design and installation of underpinned foundations. Submit drawings and calculations for review and approval by the Agency Construction Manager prior to earthwork or construction operations.

        1) This action shall be a task in the project schedule.

    b. The Contractor shall restore any portion of any building(s) damaged from any cause at no increase to the Contract Sum.

        1) All Restoration will be performed and completed to the satisfaction of the Agency Construction Manager and the building Owner.

E. Dust Control:

1. Conduct earth-moving operations and maintain work-site in a way to minimize the creation and dispersion of dust. Furnish and spread calcium chloride as directed by Agency Construction Manager for a more effective dust control at no increase to the Contract Sum.

F. Backfill Material:

1. Nature of materials will govern both their acceptability for backfill and methods best suited for their placement and compaction in backfill.

3.2 DE-WATERING:

A. General:

1. The Contractor is advised that groundwater will be encountered in the excavation and therefore groundwater control during construction will be required. The Contractor will be responsible for providing control of groundwater during construction at no increase to the Contract Sum.
2. The purpose of controlling groundwater is to provide a relatively dry and stable subgrade for construction work, reduce hydrostatic pressures on an excavation slope or an excavation support system, and prevent loss of ground that could cause settlement of adjacent facilities.
3. Control of groundwater during construction will include providing dewatering system for the removal and approved disposal of surface water, groundwater and water from other sources.

B. Perform earthwork and grading operations as required to prevent the following:

1. Surface or sub-surface water from flowing into excavations.
2. Surface or sub-surface water from flooding project site or adjacent property.
3. Water accumulations detrimental to sub-grade stability.

C. Provide, install, operate, and maintain pumps, sumps, discharge lines, and related equipment as required.

D. Dispose of pumped or drained water without undue interference to other work, damage to pavements, other surfaces or property. Refer to Section 01 35 43.27 – Liquid Management for the requirements and restrictions for handling and disposal of liquids generated by, or encountered during, construction activities.

3.3 SITE EXCAVATION:

A. Excavate materials encountered within the areas and to the elevations indicated or specified by the contract documents.

B. Removal of boulders, frozen materials, and man-made objects shall not be considered as rock excavation even if an explosive or air-activated hammer is used for their removal.

C. Handle excavated materials without undue interference to other work, damage to pavements, other surfaces, or property. Refer to Section 01 35 43.31 - Soil Management for the requirements and restrictions for handling and disposal of materials generated by, or encountered during, construction activities.

D. Carry out excavation, dewatering, excavation support and bracing operations in such a manner to eliminate possibility of undermining or disturbing foundations of existing structures or of work previously completed under this contract, and as required for safety of personnel.

E. Remove existing underground foundations, caissons, foundation walls, slabs, abandoned pipes encountered during the site excavation to at least three feet below the new structure limits as indicated or specified by the contract documents. The removal of existing facilities shall be considered as incidental to the site excavation and will not be measured and paid separately.

F. Landscape Area and Associated Masonry Walls outside of the New Building:

1. Excavate entire area indicated or specified by the contract documents. The area to be excavated is outside the new building limits and within the property line at the southeast corner of the site.
2. Remove and dispose of excavated materials, slabs, building foundations, foundation walls, pavements, storm drains, and utilities encountered.
3. Verify by penetration testing that the bearing capacity at sub-grade is 2,500 psf.
4. If unacceptable condition is encountered, the area should be over-excavated by not more than two feet.
5. Replace excavated volume with Aggregate Fill to original elevations indicated or specified by the contract documents or specified by the Agency Construction Manager. Place Aggregate Fill as specified in Article 3.10, of this Section.

3.4 FOUNDATION EXCAVATION:

A. General:

1. Excavate to elevations indicated or specified by the contract documents or specified by the Agency Construction Manager.
2. Extend excavations horizontally beyond foundations to permit the following:

    a. Formwork placement and removal.
    b. Support system placement and removal.
    c. Waterproofing.
    d. Perimeter insulation installation.
    e. Inspection.

3. Do not place concrete until the foundation sub-grade is inspected, the bearing capacity is verified by the Contractor's Construction Inspection and Testing Firm and accepted by the State's Construction Inspection and Testing Firm and Agency Construction Manager.
4. Manually trim and shape excavations prior to concrete placement.
5. Carefully clean excavations, removing loose and disturbed earth, prior to concrete placement.
6. Removal of boulders, frozen materials, and man-made objects shall not be considered as rock excavation even if an air-activated hammer is used for their removal.

3.5 UTILITY EXCAVATION:

A. General:

1. Excavate utility trenches to width and depths indicated on the drawings, or as specified.

    a. Excavate trenches to provide widths from trench bottom to 12 inches above top of utility, not to exceed 12 inches clearance on each side of utility.
    b. Excavate trenches for storm drain, water and sanitary sewer lines to six inches below bottom of pipe for full trench width. Excavate trenches for all other utilities to the bottom of utility. Do not over excavate except at pipe bells, if required.

2. Do not excavate trenches more than 50 feet ahead of installation.
3. Removal of underground foundations, foundation walls, pavements, slabs, abandoned pipes encountered during the utility excavation outside the limits of demolition indicated or specified by the Contract Documents shall be considered as incidental to the utility excavation and will not be measured and paid separately. Seal ends of open pipes with masonry bulkheads.
4. Removal of boulders, frozen materials, and man-made objects shall not be considered as rock excavation even if an air-activated hammer is used for their removal.

3.6 UTILITY STRUCTURE EXCAVATION:

A. General:

1. Excavate to sub-grade elevations indicated or specified by the contract documents.
2. Do not place concrete until the foundation sub-grade is inspected, the bearing capacity is verified by the Contractor's Construction Inspection and Testing Firm and accepted by the State's Construction Inspection and Testing Firm and Agency Construction Manager.
3. Trim and shape sub-grades to smooth and even surfaces, free of voids and depressions.
4. Removal of underground foundations, foundation walls, pavements, slabs, abandoned pipes encountered during the utility structure excavation outside the limits of demolition indicated or specified by the contract documents shall be considered as incidental to the utility structure excavation and will not be measured and paid separately. Seal ends of open pipes with masonry bulkheads.
5. Removal of boulders, frozen materials, and man-made objects shall not be considered as rock excavation even if an air-activated hammer is used for their removal.

3.7 UNSUITABLE MATERIAL:

A. Immediately notify the Agency Construction Manager in the event unsuitable material is encountered at subgrade during earthwork or subsequent construction operations.

1. Stop all work within immediate area of Unsuitable Material.
2. Unsuitability of materials shall be determined by Contractor's Construction Inspection and Testing Firm. Provide documentation to Agency Construction Manager.
3. Do not remove Unsuitable Material until authorization is obtained from the Agency Construction Manager.
4. Do not remove Unsuitable Material until proper measurements are obtained, as defined in Article 4.1, of this Section.
5. Upon receipt of authorization, excavate and dispose of all Unsuitable Material off-site. Contractor shall provide an off-site disposal area.
6. Backfill excavated area as specified in Article 3.11, of this Section.

3.8 OVER-EXCAVATION:

A. Over-excavated areas shall be backfilled as specified in Article 3.10, of this Section, at no increase to Contract Sum.

B. Unsuitable Material encountered as a result of over-excavation shall be removed and backfilled as specified in Article 3.11, of this Section, at no increase to Contract Sum. No measurement will be required.

3.9 EXCAVATED MATERIAL STORAGE:

A. Excavated materials not suitable to use as fill and backfill as specified, shall be removed and disposed off-site at no increase to the Contract Sum.

B. Excess materials shall be removed and disposed off-site at no increase to the Contract Sum.

3.10 FILL:

A. Existing Ground Surface Preparation: Remove vegetation and topsoil as specified in Clearing and Grubbing, Division 31.

B. Existing Sub-grade Preparation at Fill Locations:

1. Remove Unsuitable Material as specified in Article 3.7 upon completion of clearing operations.
2. Proof-roll the sub-grade with 35-ton rubber tire roller, or a loaded tandem axle dump truck or equivalent in presence of representative of the Contractor's Construction Inspection and Testing Firm.
3. Remove Unsuitable Material revealed by proof-rolling operations, as specified in Article 3.7.
4. Prior to placing fill, compact top 6 inches of sub-grade to 95% of the maximum dry density determined in accordance with ASTM D 1557.

C. Fill Placement:

1. Place approved fill material only as specified in Article 2.1.
2. Do not place fill on prepared sub-grade, until the sub-grade is inspected, tested, and approved by the representative of Contractor's Construction Inspection and Testing Firm.
3. Do not place fill material when prepared sub-grade, fill material, or previous lift is frozen or muddy.
4. Place fill material in loose lifts not exceeding eight inches (8 in) in thickness and compact as specified.
5. Each lift should be compacted to the specified dry density prior to the addition of subsequent lifts.
6. Each list must be inspected, tested, and approved by the representative of the Contractor's Construction Inspection and Testing Firm prior to the placement of a subsequent lift.
7. Place fill to elevations indicated or specified by the contract documents.

D. Fill Compaction and Moisture Control:

1. Obtain compaction with specified compaction equipment:

    a. Provide suitable compaction equipment to achieve the required degree of compaction for the materials encountered. If the equipment fails to compact the materials as specified, change weight and/or type of equipment.
    b. Provide compaction equipment in good mechanical operating condition.

2. Compact each lift of structural fill and aggregate fill to ninety-five percent (95%) of the maximum dry density, based on maximum dry density determined in accordance with ASTM D 1557.
3. Compact each lift of porous fill with a minimum 10-ton vibratory roller.
4. Compact each lift of porous fill with at least two passes of the roller in vibratory mode and at least two in static mode until there is no visible movement of the material.
5. Moisture Control During Placement and Compaction Operations:

    a. Moisture - Density curves will be provided by the Contractor's Construction Inspection and Testing Firm to assist in moisture control.
    b. Extensive aeration may be required to reduce in-situ moisture content to within 2 percent of optimum moisture content.

        1) Remove and replace or scarify and aerate excessively moist material, until required moisture content is obtained at no increase to Contract Sum or project completion time.

    c. Excessively dry material shall be moistened to bring it to within two percent (2%) of optimum moisture content at no increase to the Contract Sum or project completion time.

3.11 BACKFILL:

A. General:

1. Backfill excavations as promptly as Work permits, but not until completion of all required tests and inspections.

B. Backfill Placement and Compaction:

1. Place approved backfill material only as specified in Article 2.1.
2. Do not place backfill when sub-grade, backfill material, or previous lift is muddy or frozen.
3. Each lift must be inspected, tested, and approved by the Contractor's Construction Inspection and Testing Firm prior to the placement of a subsequent lift.
4. Place backfill material in loose lifts not exceeding 8 inches.
5. Compact each lift to 95% of the maximum dry density determined in accordance with ASTM D 1557.
6. Backfill Adjacent to Structures:

    a. Exercise care in the placement of backfill material adjacent to structures.
    b. Place backfill evenly to prevent wedging action against the structure.
    c. Place backfill uniformly around structure in lifts of equal thickness, not exceeding 8 inches.
    d. Compact each lift as specified above.

7. Bedding:

    a. Place bedding material at trench bottom, around and over pipes for a distance of 6 inches above the top of pipe.
    b. Place bedding material at sub-grade elevation of utility structure for a distance of 6 inches below the bottom of structure.

3.12 SUB-GRADE PREPARATION:

A. Prepare sub-grades as follows:

1. Within Limits of Demolition

    a. Grade as indicated or specified by the contract documents.
    b. Proof-roll the sub-grade with 35-ton rubber tire roller, or a loaded tandem axle dump truck or equivalent in presence of representative of the Contractor's Construction Inspection and Testing Firm.
    c. Remove Unsuitable Material revealed by proof-rolling operations, as specified in Article 3.7.
    d. Compact top 6 inches of sub-grade to 95% of the maximum dry density determined in accordance with ASTM D 1557.

B. Verify utility casting elevations and reset or adjust castings to meet flush with a finished grade. Resetting and/or adjustment to castings are incidental and shall not affect the Contract Sum.

3.13 MAINTENANCE:

A. Maintain all paved access roads in clean, mud- and dust-free condition during earthwork and subsequent construction operations.

B. Maintain completed area of Project site as follows:

1. Keep free of trash and debris.
2. Scarify, re-grade, and re-compact damaged or disturbed sub-grades.

3.14 INSPECTION AND TESTING:

A. The Contractor's Construction Inspection and Testing Firm shall perform the inspections and tests as indicated herein in accordance with Division 01. The work to be performed by the Contractor's Construction Inspection and Testing Firm shall include the following:

1. Preparation of Sub-grade:

    a. Inspect proof-rolling of sub-grades.
    b. Perform density tests on sub-grades:

        1) Test method: ASTM D 1556 or ASTM D 2922.

2) Test frequency: No less than 1 for every 2,000 square feet of sub-grade.
3) Test location: Random and as determined by representatives of the Contractor's Construction Inspection and Testing Firm State's Construction Inspection and Testing Firm and Agency Construction Manager.

2. Foundation Excavation.

a. Verify bearing capacity:

1) Test Method: Penetrometer test, using equipment that can verify the penetration resistance to a depth of eighteen inches (18 IN) below the surface.
2) Testing Frequency: One for every fifty square feet (50 SF) for rectangular or square foundation. One for every fifty linear feet (50 LF) for continuous foundation.
3) Test Location: Random and as determined by representatives of the Contractor's Construction Inspection and Testing Firm State's Construction Inspection and Testing Firm and Agency Construction Manager.

3. Utility and Utility Structure Excavation:

a. Inspect the sub-grade of utility excavation to verify that subgrade conditions are acceptable.

4. Fill and Backfill Material:

a. Perform classification tests on fill and backfill materials:

1) Test Method: ASTM D 2487.
2) Testing Frequency: One for each type of material to be used.

b. Perform moisture-density relationship tests on fill and backfill materials.

1) Test Method: ASTM D 1557.
2) Testing Frequency: 1 for each type of material to be used.

5. Placement and Compaction of Fill and Backfill:

a. Perform in-place density tests during filling and backfilling.

1) Test Method: ASTM D 1556 or ASTM D 2922.
2) Testing Frequency: No less than one for every 2,000 square feet for sub-grade approval; and one for every 250 cubic yards for Structural Fill; one for each lift for every 200 linear feet of trench; 1 for each lift for every 150 linear feet of walkway.
3) Test Location: Random and as determined by representatives of the Contractor's Construction Inspection and Testing Firm State's Construction Inspection and Testing Firm and Agency Construction Manager.

6. Removal of Unsuitable Material:

a. The Contractor shall assist the Agency Construction Manager in determining location and extent of Unsuitable Material.
b. The Agency Construction Manager shall accompany the Contractor during the measurement of quantities of Unsuitable Material.

B. The Contractor shall provide the following to the Contractor's Construction Inspection and Testing Firm at no increase to the Contract Sum:

1. Delivery tickets for each truckload of material imported to the site, indicating the name of supplier and location of borrow pit.
2. Surveying required to measure quantities of Unsuitable Material.

C. The Contractor shall correct all work not conforming with the Contract Documents as directed by the Agency Construction Manager, at no increase to the Contract Sum.

3.15 SETTLEMENT MONITORING:

A. General:

1. Perform settlement monitoring before, during and after the excavation operations. This consists of pre-construction and post-construction surveys of the surfaces around the site, monitoring surface settlement, and monitoring settlement of existing utilities and buildings. This work shall include: structural surveys of all properties, pavements, buildings, structures, and utilities within 25 feet of excavations.
2. Install and maintain instrumentation to monitor and detect movement of ground surfaces, utilities, buildings and structures. Establish monitoring points at intervals of not more than 100 feet for all properties, pavements, buildings, structures, and utilities within 25 feet of excavations. The existing to remain SUI Building (OSTC) shall have instrumentation to monitor and detect movement at each northwest and northeast corner of the building, at 25 feet intervals across the north wall of the building, and down past the project limits along the west side of the building.
3. Measurement of monitoring instruments shall be performed by a Maryland Registered Land Surveyor.
4. Establish survey control points at distance from construction area that avoids disturbance due to ground settlement.
5. Measurement of monitoring instruments shall be performed with an accuracy of 0.05 inch.
6. Instrumentation to monitor settlement may include crackmeters, building monitoring points, surface settlement points, utility settlement points and shallow subsurface settlement points.

B. Reading Frequency and Reporting

1. Record all monitoring points at least once per week starting prior to excavation construction and continuing until the excavation has been backfilled and until no more detectable movement occurs.
2. Record all monitoring points at least three times prior to excavation construction to establish base line measurements.
3. Immediately report to Agency Construction Manager any settlement, movement, or cracking that is detected.
4. If the change in the measured settlement from the base measurements exceeds 1/8-inch, the Contractor shall notify the Agency Construction Manager and take

precautionary measures to prevent further movement, settlement or damage to the effected building, area, utility or structure.

5. Following substantial completion but prior to final completion, make final survey of all monitoring points and report to Agency Construction Manager. Remove all monitoring points as directed by Agency Construction Manager.

3.16 SETTLEMENT REMEDIATION

A. The contractor shall restore to proper grade any settlement or any slab, pavement, utility, structure or lawn etc. affected by any settlement, within one year after final acceptance. All remedial restoration shall be approved by Agency Construction Manager, and shall be carried out without additional compensation.

3.17 USE OF EXPLOSIVES

A. Explosives shall not be used.

PART 4 - MEASUREMENT AND PAYMENT

4.1 MEASUREMENT:

A. Removal of Unsuitable Material, below the subgrade elevation, will be measured to the nearest cubic yard, in place, by the average end area method.

1. Unsuitable Material encountered as a result of over-excavation, unless authorized by the Agency Construction Manager, will not be measured for payment.
2. Removal of materials, which became unsuitable due to lack of protection, will not be measured for payment.

B. Excavation for the Contractor's convenience, unauthorized excavation, and backfill of such excavations will not be measured for payment.

C. Off-site borrow used for the Contractor's convenience will not be measured for payment.

D. Stockpiling and re-handling stockpiled material will not be measured separately for payment, but will be considered incidental to the work to which it pertains.

4.2 PAYMENT:

A. Base bid includes Removal of Unsuitable Materials and Replacement with Off-site Borrow. Removal of unsuitable material below subgrade elevation within the areas and to the elevations indicated or specified by the drawings and/or specifications and replacement with fill material will be based on prices quoted in the Unit Price Schedule.

END OF SECTION 31 20 00

SECTION 31 25 00 – EROSION AND SEDIMENT CONTROL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. All work must comply with the annotated Code of Maryland Regulations (COMAR), Title 27, Subtitle 17, "Erosion and Sediment Control."

C. All work must comply with Maryland Department of Environment 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control with all addenda thereto at the time bids are received.

D. Maryland Department of Transportation State Highway Administration Standard Specifications for Construction and Materials (MDOT Standard Specifications) latest edition. Subsections of the MDOT Standard Specifications describing “Measurement and Payment” shall not apply to this contract.

1.2 SUMMARY

A. Section includes: Materials and work required to control soil erosion, prevent flow of sediment from construction site, and contain construction materials (including excavation and backfill) within protected area, to prevent damage to any natural resources within or adjoining the project site.

B. Related Requirements:

1. Division 31 – Earth Work.
2. Division 32 – Exterior Improvements.
3. Division 33 – Utilities.

1.3 DEFINITIONS

A. Temporary Soil Stabilization: Application of, and anchoring mulch over otherwise unprotected soil.

1.4 SUSTAINABLE DESIGN REQUIREMENTS

A. MRc2: Construction Waste Management

1. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 01 81 13 – Sustainable Design Requirements.

B. MRc4: Recycled Content Material

1. No less than the specified minimum proportion of the building materials shall contain post-consumer and pre-consumer waste materials in accordance with the project requirements for Recycled Content Materials. All materials counted toward the computation of the proportion of the Recycled Content Materials shall comply with the standard for the minimum percentages of post-consumer waste materials and for the minimum percentage of pre-consumer waste materials. See Section 01 81 13 – Sustainable Design Requirements.
2. Contractor shall provide LEED credit verification as per section 01 33 00 – Submittal Procedures.

C. MRc5: Regionally manufactured harvested materials

1. No less than the specified proportion of the building materials shall be extracted, processed, and manufactured within 500 miles of the project site in accordance with the project requirements for Regionally Manufactured and/or Harvested Materials. See Section 018113 Sustainable Design Requirements.
2. Contractor shall provide LEED credit verification as per Section 01 33 00 – Submittal Procedures.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of products

1. Certificates

a. Submit certificates, signed by Manufacturer and Contractor, stating that the various types of geotextile filter cloth material used on the project complies with this Specification.

2. Descriptions

a. Submit product descriptions and obtain approval from the following, prior to construction of Stabilized Construction Entrances:

1) The Agency Construction Manager (ACM)
2) Maryland Department of Environment (MDE).

B. LEED Submittals:

1. Contractor shall provide LEED credit verification as per Section 01 33 00 – Submittal Procedures

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data:

B. Product Test Reports:

1.7 QUALITY ASSURANCE

A. Contractor must be certified by the Maryland Department of the Environment (MDE). This work must be done under the direct supervision of a person who has satisfactorily completed MDE's approved training program for sediment and erosion control.

B. ACM has the authority to limit surface area of erodible earth material exposed by clearing, grubbing, excavation, borrow and fill operations and to direct immediate permanent or temporary pollution control measures to control natural environmental resource degradation, including construction of temporary berms, dikes, dams, sediment basins, sediment traps, slope drains, and use of temporary mulches, mats or other control devices or methods as necessary to control erosion.

C. The contractor shall at all times maintain a certified copy of the soil erosion and sediment control plan at the construction site.

1.8 PROJECT CONDITIONS

A. See Article 1.7 – Project Conditions in Section 31 20 00 – Earth Moving.

B. Limitations: Work Sequence shall comply with "Sequence of Construction" shown on the Contract Drawings.

1.9 CONSTRUCTION SURVEYS:

A. See Division 01 – General Requirements.

B. Provide horizontal alignment stakes for location of silt fences, at intervals of 50 feet maximum and at each change in direction.

PART 2 - PRODUCTS

2.1 AGGREGATES

A. Coarse Aggregate (2" stone): AASHTO – M 43, Size No. 2 or 24.

2.2 GEOTEXTILE FABRICS

A. For Stabilized Construction Entrance:

1. Non-woven Filter Cloth shall meet the requirements of Section H-1: Standards and Specifications for Materials from the 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control for Heavy Duty Haul Roads.

B. For all other uses:

1. Filter-X as manufactured by Carthage Mills, Inc., Cincinnati, Ohio, or
2. Mirafi 100X as manufactured by Mirafi, Inc., Charlotte, North Carolina, or

3. Approved equal following Substitutions: Under provisions of Division 01 – General Requirements.

2.3 STABILIZED CONSTRUCTION ENTRANCE

A. The Stabilized Construction Entrance (SCE) shall be installed and maintained per page B.1 and detail B-1 (page B.2) of 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control. See Contract Drawings for location(s).

2.4 SILT FENCE:

A. Silt Fence shall be installed and maintained per page E.1 and detail E-1 (page E.2 and E.3) of the 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control. See Contract Drawings for location(s) and length(s).

B. Fence Posts:

1. Type: Steel "T" or "U" channel, with punches or riveted lugs for fence attachment, for silt fence.

   a. Weight: 1 pound per linear foot minimum.
   b. Length: 36 inches minimum.
   c. Pointed one end.

2. Contractor's Option: Hardwood posts.

   a. Size: 2 by 2 inch.
   b. Length: 36 inches minimum.
   c. Pointed one end.

C. Silt Fence Fabric:

1. Type: Woven Silt Film Geotextile Fabric as specified in Table H.1 (page H.1) in Section H – Standards and Specifications for Materials of the 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control.

2.5 SEED, MULCH, AND SOD:

A. See Section 32 92 00 – Turf and Grasses and the Contract Drawings. If any discrepancies are found between the two the more stringent shall apply.

2.6 PORTABLE SEDIMENT TANK:

A. Portable Sediment Tank (PST) shall be installed and maintained per page F.6 and Detail F-3 (page F.7) of the 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control.

2.7 TEMPORARY GABION OUTLET STRUCTURE:

A. Temporary Gabion Outlet Structure (TGOS) and transition to Earth Dike shall be installed and maintained per page E.20 and Detail E-8 (pages E-21 and E-22) of the 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control. See the Contract Drawings for location(s).

2.8 EARTH DIKE

A. Earth Dike (ED) shall be installed and maintained per pages C.1 to C.4 and Detail C-1 (page C.5) of the 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control. See the Contract Drawings for size and location(s) of ED.

2.9 SUPER SILT FENCE

A. Super Silt Fence (SSF) shall be installed and maintained per page page E.6 and Detail E-3 (page E.7) of the 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control.

B. Silt Fence Fabric:

1. Type: Woven Silt Film Geotextile Fabric as specified in Table H.1 (page H.1) in Section H – Standards and Specifications for Materials of the 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control.

2.10 SILT FENCE ON PAVEMENT

A. A. Super Silt Fence (SFOP) shall be installed and maintained per page E.4 and Detail E-2 (page E.5) of the 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control.

B. Silt Fence Fabric:

1. Type: Woven Silt Film Geotextile Fabric as specified in Table H.1 (page H.1) in Section H – Standards and Specifications for Materials of the 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control.

2.11 ONSITE CONCRETE WASHOUT STRUCTURE

A. The Onsite Concrete Washout Structure (CWS) shall be installed and maintained per page H.23 and Detail H-6 (pages H.24 and H.25) of the 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control.

B. The Contractor shall construct a CWS prior to the commencement of any Concrete pouring operations for the purpose of washing out the concrete trucks after placement of concrete. The Contractor may move the CWS between concrete pours; however the breakdown and reloated structure must follow the directions found in the 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control.

2.12 STOCKPILE

A. The Contractor shall remove any spoils generated by the end of each workday to an approved location. Although demolition rubble is excluded, the rubble shall be removed from the site adequately to keep the remaining pile to a minimal size. The size of the pile shall be at the digression of the Agency Construction Manager.

PART 3 - EXECUTION

3.1 GENERAL:

A. All work shall be done in accordance with the 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control and the Contract Documents.

3.2 STABILIZED CONSTRUCTION ENTRANCE:

A. Construct Stabilized Construction Entrance (SCE) at location(s) shown on the Contract Drawings, and at the time indicated in the approved sequence of construction. Maintain SCE by cleaning and properly grading at regular intervals until removed. The SCE should be inspected every day and at the end of every rain event.

3.3 SILT FENCE:

A. Construct Silt Fence (SF) at locations shown on the drawings, and maintain all SF in good repair. Re-erect destroyed or damaged fences within 24 hours.

B. Installation:

1. Excavate a trench a minimum of eight inches (8 in) deep along “up stream" side of fence.

2. Set posts plumb not more than six feet (6 ft) on center. Drive posts to a minimum of sixteen inches (16 in) into ground.

3. Install silt fence fabric taut on "up stream" side of posts. Silt fence filter fabric shall be embedded a minimum of 8” vertically into ground.

4. Secure silt fence fabric with wire or staples to posts.

5. Backfill trench and compact

3.4 SUPER SILT FENCE:

A. Construct Super Silt Fence (SSF) at locations shown on the drawings, and maintain all SF in good repair. Re-erect destroyed or damaged fences within 24 hours.

B. Installation:

1. Excavate a trench a minimum of eight inches (8 in) deep along "up stream" side of fence.

2. Set posts plumb not more than 10 feet on center. Drive posts to a minimum of sixteen inches (16 in) into ground.

3. Place silt fence filter fabric on galvanized chain link fence matching bottom edges. Fasten silt fence filter fabric to galvanized chain link fence with wire ties at top, mid-height and bottom of fence every twenty four inches on center along the length of the fence.

4. Install chain link fence with silt fence filter fabric taut on "up stream" side of posts. Both chain link fence and silt fence filter fabric shall be embedded a minimum of 8” vertically into ground.

5. Secure composite fabric with wire or staples to posts.

6. Backfill trench and compact.

3.5 SILT FENCE ON PAVEMENT:

A. Construct Silt Fence On Pavement (SFOP) at locations shown on the drawings, and maintain all SF in good repair. Re-erect destroyed or damaged fences within 24 hours.

B. Silt Fence On Pavement shall be installed in accordance with the instructions provided in the 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control and the Contract Documents.

3.6 INLET PROTECTION:

A. Construct any type of Inlet Protection at locations shown and at the time indicated on the Drawings.

B. Any type of Inlet Protection shall be installed in accordance with the instructions provided in the 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control and the Contract Documents.

3.7 SOIL STABILIZATION:

A. General:

1. Provide controls required to prevent soil, sediment, and debris from following on-to adjacent and downstream properties, prior to and/or during work under this Contract.
2. Following initial soil disturbance or re-disturbance, permanent or temporary stabilization of all dikes, swales, ditches, and slopes greater than three horizontal to one vertical (3:1) shall be completed within three (3) calendar days. Stabilization of all other disturbed or graded areas on the project site shall be completed within seven (7) calendar days.
3. Temporarily stabilize topsoil stockpiles within seven (7) calendar days after completion of initial earthwork operations.
4. Temporarily stabilize soil immediately upon completion of grading operations, when no seeding date is applicable.

B. Mulching:

1. Apply mulch uniformly over area to be stabilized.
2. Minimum Application Rate: two (2) tons per acre to a loose depth of one to two inches (1 in - 2 in).

C. Anchoring:

1. Anchor mulch by one of the following methods:

a. Netting Method: Cover and anchor mulch with netting in accordance with netting manufacturer's installation instructions.
b. Organic Binder Method: Apply organic binder mixture uniformly over mulch, in accordance with manufacturer's application instructions and as noted.

1) Mixture Application Rate: 18 gallons per 1000 square feet.

D. Temporary and Permanent Vegetation:

1. Immediately stabilize completed unpaved areas as specified in Section 32 92 00 – Turf and Grasses.
2. Immediately stabilize back-filled utility trenches as specified in Section 32 92 00– Turf and Grasses.
3. Immediately stabilize Planting Areas as specified in Section 32 93 00 – Plantings.

3.8 PORTABLE SEDIMENT TANK:

A. Provide and maintain Portable Sediment Tank(s) (PST) to trap and retain sediment prior to pumping the water to drainage-ways and conveyance systems.

B. Provide and maintains PST's when water is pumped and discharged to drainage-ways.

3.9 MAINTENANCE:

A. General:

1. All sediment and erosion control measures shall be maintained as required by the Contract Drawings, this Article and the 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control, at no increase to the Contract Sum.
2. Maintain soil erosion and sediment controls, to Project completion date, at no increase to Contract Sum.
3. Inspect and remove silt and debris accumulations from the stabilized construction entrances, silt fences, inlet protection and storm inlet sediment traps at regular intervals, as specified in the 2011 Maryland Standards and Specifications for Soil Erosion and Sediment Control, and when directed by the Agency Construction Manager.

B. Stabilized Construction Entrance:

1. Remove and replace gravel aprons or provide additional gravel top dressing, as directed by the Agency Construction Manager.

C. Silt Fences:

1. Inspect on a weekly basis and/or
2. Inspect immediately after each rain event and daily during prolonged rain event.
3. Remove sediment accumulation as required by the specifications.
4. Remove and replace damaged filter cloth and fence before resuming construction operations.

D. Inlet Protection:

1. Inspect on a weekly basis and/or
2. Inspect immediately after each rain event and daily during prolonged rain event.
3. Repair and/or replace any washout before resuming construction operations.
4. Remove sediment accumulation as required by the specifications.
5. Replace filter fabric when it becomes clogged and rebuild protection as necessary to maintain tight sediment filters at the inlets.

E. Portable Sediment Tank:

1. Inspect immediately after each rain and daily during prolong rainfall or pumping usage.
2. Properly dewater and dispose of accumulated sediment once the sediment has reached the cleanout depth, see specifications.

F. Temporary Gabion Outlet Structure:

1. Inspect immediately after each rain event and daily during prolong rain events or pumping usage.
2. Properly dewater and dispose of accumulated sediment once the sediment has reached the cleanout depth.

G. Earth Dike:

1. Inspect immediately after each rain and daily during prolong rainfall.
2. Repair and/or replace any washouts or eroded areas before resuming construction operations

3.10 REMOVAL:

A. General:

1. Obtain authorization from the Agency Construction Manager and the Authority having jurisdiction for the Sediment Control Inspection and Approval before removing any erosion and/or sediment controls.
2. Do not remove sediment controls before unpaved areas are stabilized with a full stand of vegetation as specified in Section 32 92 00 – Turf and Grasses or Section 32 93 00 - Plants.
3. Once removed all areas disturbed by the removal of the erosion and/or sediment controls shall be permanently stabilized in accordance with the specifications.

3.11 CLEANING:

A. Clean improvements and facilities damaged by any over-spray or hydraulic seeding over-spray, as directed by the Agency Construction Manager.

END OF SECTION 31 25 00

SECTION 32 05 23 – CEMENT AND CONCRETE FOR EXTERIOR IMPROVEMENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 – General Requirements Specification Sections, apply to this Section.

B. City of Baltimore: Department of Public Works – Specifications For Materials, Highways, Bridges, Utilities, and Incidental Structures with all addenda thereto at the time bids are received (DPW Standard Specifications.) Subsections of DPW Standard Specifications describing “Measurement and Payment” shall not apply to this contract.

C. City of Baltimore: Department of Transportation – Book of Standards with all addenda thereto at the time bids are received (DOT Standards.) Subsections of DOT Standards describing “Measurement and Payment” shall not apply to this contract.

D. American Society of Testing and Materials International (ASTM) standards and test methods.

E. American Concrete Institute Standard (ACI) – Manual of Concrete Practice with all addenda thereto at the time bids are received.

1.2 SUMMARY

A. Section includes concrete and reinforcing materials and work required for the construction of the following:

1. Incidental structures.
2. Walkways/Concrete Pads not in the City of Baltimore Right-of-way.

B. Related Requirements:

1. Section 31 20 00 – Earth Moving.
2. Section 32 10 00 – Bases, Ballast, and Paving.
3. Section 32 16 00 – Curbs, Gutters, Sidewalks, and Driveways.
4. Section 32 17 00 – Pavement Specialties.
5. Section 33 10 00 – Water Utilities.
6. Section 33 31 00 – Sanitary Sewer Utilities.
7. Section 33 40 00 – Storm Drainage Utilities.

1.3 SUSTAINABLE DESIGN REQUIREMENTS

A. SSc7.1 Reduction of Heat Island Effect - Non-Roof Surfaces

1. All concrete mixes and precast pavers identified as high SRI in the Plans used for exterior paving shall have a Solar Reflective Index rating (SRI) of 29 or

greater in accordance with the project requirements for Reduction of Heat Island Effect - Non-Roof Surfaces. See Section 01 81 13 – Sustainable Design Requirements

2. Contractor shall provide LEED credit verification as per Section 01 33 00 – Submittal Procedures.

B. MRc2: Construction Waste Management

No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 01 81 13 – Sustainable Design Requirements.

C. MRc4: Recycled Content Material

No less than the specified minimum proportion of the building materials shall contain post-consumer and pre-consumer waste materials in accordance with the project requirements for Recycled Content Materials. All materials counted toward the computation of the proportion of the Recycled Content Materials shall comply with the standard for the minimum percentages of post-consumer waste materials and for the minimum percentage of pre-consumer waste materials. See Section 01 81 13 – Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 01 33 00 – Submittal Procedures.

D. MRc5: Regionally manufactured harvested materials

1. No less than the specified proportion of the building materials shall be extracted, processed, and manufactured within 500 miles of the project site in accordance with the project requirements for Regionally Manufactured and/or Harvested Materials. See Section 01 81 13 – Sustainable Design Requirements.
2. Contractor shall provide LEED credit verification as per Section 01 33 00 – Submittal Procedures.

1.4 ACTION SUBMITTALS

A. General: Provide submittals in compliance with General Conditions of the Contract and Division 01 – General Requirements.

B. Concrete Mix Design:

1. Submit mix design for all classes of concrete to the Agency Construction Manager for review and approval. Do not order or place any concrete before the mix design is approved.
2. Submit certified laboratory test reports for mix design test and aggregates.
3. Post placement testing at the seven (7) day and twenty-eight (28) day intervals shall be given to the Agency Construction Manager for review and acceptance.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Delivery:

1. Schedule delivery operations to avoid unnecessary re-handling.

B. Storage:

1. Store materials in accordance with manufacturer's recommendations.

1.6 PROJECT CONDITIONS

A. Limitations:

1. Underground Utilities:

a. Do not proceed with concrete pavement construction until all underground utility construction is complete, passed testing and accepted by the Agency Construction Manager.

2. Environmental:

a. All provisions of ACI 306R shall be followed for cold weather concrete placement and ACI 305R for hot weather concrete placement.

1.7 CONSTRUCTION SURVEYS

A. See Division 01 – General Requirements.

B. Provide combined horizontal and vertical alignment stakes for construction of pavements on a continuous slope at intervals of 50-foot maximum and/or

C. Provide combined horizontal and vertical alignment stakes for construction of pavements on curves at 25-foot maximum and/or

D. Provide alignment stakes at all horizontal angle points.

PART 2 - PRODUCTS

2.1 PORTLAND CEMENT CONCRETE

A. Portland cement concrete shall be in accordance with Division 03 – Concrete of the DPW Standard Specifications

2.2 CONCRETE REINFORCEMENT

A. Plain Carbon-Steel Bars, ASTM A 615, Grade 60, diameter, length and configuration as indicated on the Contract Drawings.

B. Deformed Bars, ASTM A 615, Grade 60, diameter, length and configuration as indicated on the Contract Drawings.

C. Welded Wire Reinforcement, ASTM A 185, gauge and size as indicated on the Contract Drawings.

2.3 JOINT MATERIALS

A. Expansion and Isolation Joints, ASTM D 994.

1. Type: Bituminous preformed joint filler.
2. Nominal Thickness:

a. Isolation Joints: 1/2-inch.
b. Expansion Joints: 3/4-inch.

2.4 CONCRETE MIXES

A. Concrete Mix No. 2:

1. 28-day Compressive Strength: 3,000 psi.
2. Air Entrainment: 5 - 8%.
3. Mix Contents:

a. Portland Cement: 6-1/2 bags (611 lbs.) per cubic yard.
b. Water: 5-1/4 gallons per bag of cement.

4. Slump Range: 2 - 5 inches.
5. Solar Reflex Index : 29 or higher (when exposed to surface)

B. Concrete Mix No. 6:

1. 7-day Compressive Strength: 3,000 psi.
2. 28-day Compressive Strength: minimum of 4,500 psi.
3. Air Entrainment: 5 - 8%.
4. Mix Contents:

a. Portland Cement Concrete: 7-1/2 bags (705 lbs.) per cubic yard.
b. Water: 5 gallons per bag of cement.

5. Slump: 2 - 4 inches.
6. Solar Reflex Index : 29 or higher (when exposed to the surface).

2.5 CURING MATERIAL

A. Mat Method:

1. Burlap Mats: AASHTO M 182, Class 1.

B. Sheeting Method:

1. Waterproof Paper: ASTM C 171, white type.
2. Polyethylene Film: ASTM C 171, white opaque, 8 mill thick

C. Liquid membrane forming curing materials are prohibited.

2.6 AGGREGATE BASE

A. Graded Aggregate Sub-base (GAB): Graded aggregate for sub-base courses shall meet the gradation requirements of ASTM D 2940 for sub-base. In addition, that material shall meet all the other requirements listed in Division 32 of the DPW Standard Specifications. The granular Base shall be an evenly graded mixture of fine and coarse aggregates to provide, when compacted, a smooth and even surface below slabs on grade.

2.7 GEOTEXTILE FABRICS

A. Class: ST

1. Properties

a.	Type	WOVEN	
b.	Grab Strength (min 15% elongation)	300 lb	ASTM D 4632
c.	Puncture Strength	100 lb	ASTM D 6241
d.	Permittivity	0.05 sec^{-1}	ASTM D 4491
e.	Apparent Opening Size (min)	0.15 mm	ASTM D 4751
f.	Trapezoid Tear Strength	110 lb	ASTM D 4533

2. All property values are based on minimum average roll values in the weakest principle direction.
3. The ultraviolet stability shall be 50 percent after 500 hours of exposure.

PART 3 - EXECUTION

3.1 EXECUTION

A. Excavate, at the locations shown on the Contract Drawings, for incidental structures.

B. Promptly repair slides, slip-outs, wash-outs, settlements, and subsidence which occur for any reasons and re-finish to the correct lines and grades.

C. Remove all unsuitable material located below the limits of excavation and back-fill as specified in Section 31 20 00 – Earth Moving.

D. Place material on prepared sub-grade to depth required to produce compacted thickness indicated on Contract Drawings.

E. Prepare sub-grade for pavements as specified in Section 31 20 00 – Earth Moving.

F. Verify utility casting elevations and reset or adjust castings to meet flush with finished pavement surface. Adjust casting for cross slope, if any.

3.2 BASE COURSE

A. Place a Woven Geotextile Class: ST on top of prepared subgrade, where noted on the Contract Drawings. Place base course on Geotextile to depth required to produce compacted thickness indicated on Contract Drawings.

B. Compact to 95% of the maximum dry density determined in accordance with ASTM D 1557.

3.3 EXPANSION JOINTS

A. Install expansion joints at 30-foot intervals, or as indicated on Contract Drawings.

B. Place expansion joints perpendicular to concrete surface.

C. Place expansion joints with top edge 1/4-inch below concrete surface, unless otherwise noted on the Contract Documents.

3.4 CONTRACTION JOINTS

A. Provide contraction joints at 10-foot intervals, or as indicated on the Contract Drawings.

B. Form contraction joints, perpendicular to concrete surface, with removable 1/8 inch form spreader plates or tool joint with a 1-inch jointing tool.

3.5 ISOLATION JOINTS

A. Install isolation joints where concrete abuts buildings, walls, utility structures, foundations, and castings.

B. Place isolation joint with top edge 1/4-inch below concrete surface.

3.6 CONCRETE PLACEMENT

A. Place concrete carefully to prevent joint material dislocation.

B. Consolidate concrete by tamping or vibrating to prevent honeycomb.

3.7 FINISHING

A. Strike off top surfaces to top of forms and to a smooth and uniform texture.

B. Finish edges and joints with 1/8-inch radius edging tool.

C. Provide broom finish or as directed on the Contract Drawings.

D. Maintain forms in place for a minimum of 12 hours after concrete placement.

E. Correct defects (e.g., holes, honeycomb, broken edges, etc.) upon removal of forms with cement mortar unless directed otherwise by the Agency Construction Manager, at no increase to the Contract Sum.

3.8 CURING:

A. Mat Method:

1. Moisten mats thoroughly with water before placing on concrete.
2. Place mats on exposed concrete surfaces with 6 inch joint overlaps.
3. Maintain mats in continuously moist condition for 7 calendar days.
4. Repair or replace damaged mats.

B. Sheeting Method:

1. Moisten concrete surface with a fine spray of water before sheeting placement.
2. Place sheeting on exposed concrete surfaces with light-colored side up and 12 inch joint overlaps.
3. Anchor sheeting securely in place.
4. Maintain sheeting in place for seven (7) calendar days.
5. Repair or replace damaged sections of sheeting.

3.9 INSPECTION AND TESTING:

A. The Contractor's Construction Inspection Testing Firm shall inspect the placement of concrete and perform tests in accordance with Division 01 – General Requirements and this Section of these specifications. The inspection and testing shall include the following:

1. Inspect excavation and form-work prior to the placement of concrete.
2. Inspect the placement of base course.
3. Perform base course laboratory tests.

    a. Moisture-Density Relationship Test Method: ASTM D 1557 and ASTM D 4253.
    b. Gradation Tests: ASTM C 136.
    c. Testing Frequency: one (1) for each type of base course material submitted for use by the Contractor.

4. Perform base course in place density tests.

    a. Test Method: ASTM D 1556 or ASTM D 3017.
    b. Frequency of Test: one (1) for every 200 linear feet of base course.

5. Inspect all reinforcement to assure proper placement, cover, number of bars, adequately tied and conforms to all of the Contract Documents.

6. Inspect concrete placement.
7. Sample and test concrete.

    a. Slump Test:

        1) Test Method: ASTM C 143/C 143M.
        2) Testing Frequency: one (1) per truck load.

b. Air Content Test:

1) Test Method: ASTM C 231.
2) Testing Frequency: one (1) for every fifty cubic yards (50 cy) of concrete placed with a minimum of one (1) for each work day concrete is placed.

c. Make cylindrical test specimens.

1) Test Method: ASTM C 31C 31M.
2) Testing Frequency: one (1) set of four (4) for every fifty cubic yards (50 cy) of concrete placed with a minimum of a set of 4 for each day concrete is placed.

d. Compressive Strength of Concrete Cylinders:

1) Test Method: ASTM C 39.
2) Testing Frequency: two (2) at seven (7) days and two (2) at twenty-eight (28) days after molding.

8. Mowing Strip and Pavement Surface Smoothness Test:

a. Tolerance: Not to exceed 3/8-inch between any two (2) surface contacts on a ten foot (10 ft) straight-edge.
b. Test Locations: Random and as determined by the representative of the Contractors Construction Inspection Test Firm.

B. In the event that the compressive strength of any concrete cylinder falls below the specified strength, the test results shall be analyzed in accordance with the ACI Manual of Concrete Practice (ACI 214) by the Contractors Construction Inspection Test Firm. The results of the analysis shall be provided to the Agency Construction Manager . The Contractor shall obtain core samples of the concrete, if directed by the Agency Construction Manager, at no increase to the Contract Sum. The core samples shall be collected in accordance with ASTM C 42 and the samples shall be tested by the Contractors Construction Inspection Test Firm in accordance with ASTM C 39.

C. The Contractor shall provide delivery tickets for each truck load of concrete to the Contractors Construction Inspection Test Firm. The ticket shall indicate the name of the concrete supplier, mix design of the concrete, whether the concrete is ready mix or transit mix, time of mixing, and volume of concrete.

D. The Contractor shall provide a 10-foot straight-edge for performing concrete surface smoothness tests.

3.10 CORRECTIVE WORK:

A. All work not conforming to the Contract Documents (drawings and specifications) shall be corrected by the Contractor as directed by the Agency Construction Manager at no increase to the Contract Sum.

END OF SECTION 32 05 23

SECTION 32 10 00 – BASES, BALLAST, AND PAVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 – General Requirements Specification Sections, apply to this Section.

B. City of Baltimore: Department of Public Works – *Specifications For Materials, Highways, Bridges, Utilities, and Incidental Structures* with all addenda thereto at the time bids are received (DPW Standard Specifications.) Subsections of DPW Standard Specifications describing "Measurement and Payment" shall not apply to this contract.

C. City of Baltimore: Department of Transportation – *Book of Standards* with all addenda thereto at the time bids are received (DOT Standards.) Subsections of DOT Standards describing "Measurement and Payment" shall not apply to this contract.

D. American Society of Testing and Materials International (ASTM) standards and test methods.

E. American Association of State Highway and Transportation Officials (AASHTO) *Standard Specifications for Transportation Materials and Methods of Sampling and Testing* and *A policy of Geometric Design of Highways and Streets*.

F. Federal Highway Administration – *Manual on Uniform Traffic Control Devices* (MUTCD.)

1.2 SUMMARY

A. Section includes:

1. Flexible and Rigid Pavements
2. Construction of aggregate sub-base.

B. Related Requirements:

1. Section 31 20 00 – Earth Moving.
2. Section 32 05 23 – Cement and Concrete for Exterior Improvements.

C. Description

1. Selected materials and method for the work in this section are in accordance with the applicable provisions of the Baltimore City DPW Standard Specifications. Subsections of the specifications describing "Measurement and Payment" shall not apply to this work.

1.3 SUSTAINABLE DESIGN REQUIREMENTS

A. SSc7.1 Reduction of Heat Island Effect - Non-Roof Surfaces

1. All concrete mixes and precast pavers identified as high SRI in the Contract Drawings used for exterior paving shall have a Solar Reflective Index rating (SRI) of 29 or greater in accordance with the project requirements for Reduction of Heat Island Effect - Non-Roof Surfaces. See Section 01 81 13 Sustainable Design Requirements.
2. Contractor shall provide LEED credit verification as per section 01 33 00 Submittal Procedures.

B. MRc2: Construction Waste Management

1. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 01 81 13 Sustainable Design Requirements.

C. MRc4: Recycled Content Material

1. No less than the specified minimum proportion of the building materials shall contain post-consumer and pre-consumer waste materials in accordance with the project requirements for Recycled Content Materials. All materials counted toward the computation of the proportion of the Recycled Content Materials shall comply with the standard for the minimum percentages of post-consumer waste materials and for the minimum percentage of pre-consumer waste materials. See Section 01 81 13 Sustainable Design Requirements.
2. Contractor shall provide LEED credit verification as per section 01 33 00 Submittal Procedures.

D. MRc5: Regionally manufactured harvested materials

1. No less than the specified proportion of the building materials shall be extracted, processed, and manufactured within 500 miles of the project site in accordance with the project requirements for Regionally Manufactured and/or Harvested Materials. See Section 018113 Sustainable Design Requirements.
2. Contractor shall provide LEED credit verification as per Section 01 33 00 Submittal Procedures.

1.4 SUBMITTALS

A. Field Test Reports

1. Compaction Tests

B. Certificates

1. Materials

1.5 PROJECT CONDITIONS

A. Coordination: Article "Project Conditions" in Section 31 20 00 – Earth Moving.

B. Vehicular and Pedestrian Maintenance of Traffic must be provided in accordance with Sections 01 55 26, 01 55 27, and 01 55 28 of the DPW Standard Specifications, and as allowed by the City of Baltimore.

PART 2 - PRODUCTS

2.1 MATERIALS:

A. Pavement Operations and Maintenance: See DPW Standard Specification, Section 32 01 00.

B. Aggregate Subbase: See DPW Standard Specification, Section 32 11 00.

C. Hot Mix Asphalt Materials: See DPW Standard Specification, Section 32 12 00.

D. Concrete: See DPW Standard Specification, Section 32 13 00.

PART 3 - EXECUTION

3.1 MAINTENANCE OF TRAFFIC (MOT):

A. The Contractor shall be responsible for the MOT, pedestrian and vehicular, on all public and private roads while working on or near such roads and within the project site as required for this project for safe and continuous maintenance of traffic throughout the area affected by the project work. All cost associated with the maintenance of traffic, pedestrian and vehicular, shall be included in the base bid.Items used for maintenance of traffic shall be removed from the project site when no longer needed.

B. MOT shall be in accordance with DPW Standard Specifications and the latest Manual on Uniform Traffic Control Devices (MUTCD), as directed by the City of Baltimore.

3.2 PROTECTION AND RESTORATION:

A. Bituminous Concrete Pavement:

1. Protect improvements and facilities during prime coat application and tack coat application to prevent over-spray damage.
2. Protect completed surface from damage.

    a. Do not permit heavy equipment on completed surface.
    b. Do not permit vehicular traffic on bituminous concrete pavement until it has set sufficiently to prevent marking.
    c. Restore damaged pavement as directed by, and to the satisfaction of the Agency Construction Manager at no increase to the Contract Sum.

B. Pavement Marking:

1. Do not permit vehicular or pedestrian traffic on completed marked pavement until paint or other marking materials has set and are hardened.

2. Restore damaged paint marking as directed by the Agency Construction manager.

3.3 SUB-GRADE PREPARATION:

A. See Section 31 20 00 – Earth Moving.

B. Verify sub-grade elevations and correct discrepancies before proceeding with sub-base course construction.

C. Verify utility casting elevations and reset or adjust castings to meet flush with finished pavement surface. Adjust castings for road cross slope, if any.

D. Do not place base material on frozen or muddy sub-grade.

3.4 SUB-BASE COURSE:

A. Place material on prepared sub-grade to depth required to produce compacted thickness indicated on Contract Drawings.

B. Shape material to sections and elevations indicated with blade grader and compact with steel drum vibratory rollers to 95% of the maximum dry density determined in accordance with ASTM D 1557.

C. Proof-roll the base course with 10-ton pneumatic tire roller or equivalent in the presence of representative from the State Construction Inspection and Testing Firm, and the Contractors Construction Inspection and Testing Firm. Correct all irregularities without an increase to the Contract Sum unless otherwise noted herein.

3.5 BITUMINOUS CONCRETE PAVEMENT FOR ROADWAYS AND SIDEWALKS:

A. Prime Coat:

1. Remove loose material from surface of compacted sub-base course before applying prime coat.
2. Apply prime coat material uniformly to surface at a rate of 0.30 gallon per square yard. Prime coat shall cure a minimum of 24 hours prior to construction of bituminous concrete pavement or as long as required for prime coat to attain proper penetration.

B. Tack Coat:

1. Apply tack coat at a rate of 0.05 gal/sq. yd. over asphalt base.
2. Apply tack coat material to the following surfaces in contact with bituminous concrete pavement:

    a. Previously placed bituminous concrete.
    b. Existing pavement.
    c. Utility castings.
    d. Structures abutting or projecting into bituminous concrete.

C. Joints: See DPW Standard Specifications, Section 32 12 16.13 Part 3.8.

D. Compaction: See DPW Standard Specifications, Section 32 12 16.13 Part 3.7.

3.6 CONCRETE PAVEMENT FOR ROADWAYS:

A. See DPW Standard Specifications, Section 32 13 13 and the Contract Drawings.

3.7 UTILITY CASTINGS, MANHOLE COVERS, INLET GRATES

A. Verify utility casting, manhole cover and inlet grate elevations and reset or adjust to meet flush with a finished grade.

3.8 INSPECTION AND TESTING:

A. The inspection and testing of all work specified in this Section shall be performed by the Inspection and Testing Agency in accordance with Division 01. The work to be performed by the Inspection and Testing Agency and shall include the following:

1. Inspect the placement of the sub-base course.
2. Perform sub-base course laboratory tests.

    a. Moisture-Density Relationship Test Method: ASTM D 1557, Method D 4253.
    b. Gradation Tests: ASTM C 136.
    c. Testing Frequency: one (1) for each type of base course material submitted for use by the Contractor.

3. Perform sub-base course in place density tests.

    a. Test Method: ASTM D 1556 or ASTM D 3017.
    b. Frequency of Test: one (1) for every 1,200 square feet of paved surface.

4. Perform sub-base course thickness test.

    a. Test Method: Test holes.
    b. Testing Locations: Random and as determined by the representative of the Inspection and Testing Agency.

5. Inspect the construction of bituminous concrete pavements for compliance with the Articles of this Section.
6. Perform bituminous concrete pavement density tests.

    a. Test Method: ASTM D 2950.
    b. Testing Frequency: one (1) for every 1,200 square feet of paved surface.

7. Perform bituminous concrete surface course smoothness test.

    a. Test Locations: Random and as determined by the representative of the Inspection and Testing Agency.
    b. Tolerance: Not to exceed one-quarter of an inch (1/4 in) between any two (2) surface contacts on ten foot (10 ft) straight-edge.

3.9 The Contractor shall provide the following to the Inspection and Testing Agency at no increase to the Contract Sum:

1. Delivery tickets for each truck load of the graded aggregate sub-base indicating the name of the supplier, location of the source, and gradation of material.
2. The Marshall density value of bituminous concrete mixture for each day of paving.
3. Delivery ticket for each truck of bituminous concrete showing the name of the plant, quantity of bituminous concrete mix, mix temperature, gradation of aggregate, and asphalt content in percentage.
4. 10-foot straight-edge for performing smoothness and alignment tests.

B. All work not conforming to the Contract Drawings and the Contract Specifications shall be corrected by the Contractor to the satisfaction of the Agency Construction Manager at no increase to the Contract Sum.

3.10 CLEANING:

A. See Division 01 – General Requirements.

B. Clean improvements and facilities damaged by prime coat over-spray or tack coat over-spray, as directed by the Agency Construction Manager at no increase to the Contract Sum.

END OF SECTION 32 10 00

SECTION 32 14 43 - POROUS UNIT PAVING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Porous paving consisting of **Belgian Blocks** set in aggregate setting beds.
2. Edge restraints.

1.2 SUBMITTALS

A. Product Data: For materials other than aggregates.

B. Sieve Analyses: For aggregate materials, according to ASTM C 136.

C. Samples for unit pavers, 4” x 8”x 4” Grey Granite Belgian Block, aggregate fill and edge restraints. Label Sample with manufacturer's name, material description, color, pattern, and designation indicated on Drawings and in schedules.

1.3 QUALITY ASSURANCE

A. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.

1. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

B. Samples: Submit Belgian Block samples, 3 to 5 pavers, which represent the colors, size, shape, and quality of the pavers for approval.

PART 2 - PRODUCTS

2.1 BELGIAN BLOCKS

A. Regional Materials: Belgian Blocks shall be manufactured within 500 miles of Project site from granite that have been extracted, harvested, or recovered, as well as manufactured, within 500 miles of Project Site.

B. All pavers and join materials identified as high SRI in the Plans used for exterior paving shall have a Solar Reflective Index rating (SRI) of 29 or greater in accordance with the project requirements for Reduction of Heat Island Effect - Non-Roof Surfaces. Products: Belgian Blocks within tree wells shall match in quantity, fabrication and style those shown on plans and as follows:

1. 4" x 8"x 4" Grey Granite Belgian Block as manufactured by Harwood Landscaping Products, 4534 Old Solomons Island Road, Harwood, MD. 20776. 1-800-990-STONE, or approved equals.

2.2 ACCESSORIES

A. Steel Edge Restraints: Painted steel edging, 3/16 inch (4.8 mm) thick by 4 inches (100 mm) high], with loops pressed from or welded to face to receive stakes at 36 inches (900 mm) o.c., and with steel stakes 15 inches (380 mm) long for each loop.

Steel Edge Restraints shall be as manufactured by Border Concepts, Inc. or approved equal.

1. Color: Black

2.3 AGGREGATE SETTING-BED MATERIALS

A. Graded Aggregate for Subbase: Sound crushed stone or gravel complying with ASTM D 448 for Size No. 2 for subbase.

B. Graded Aggregate for Base Course: Sound crushed stone or gravel complying with ASTM D 448 for Size No. 57 for base-course material

C. Graded Aggregate for Leveling Course: Sound crushed stone or gravel complying with ASTM D 448 for Size No.8.

D. Graded Aggregate for Porous Paver Fill: Sound crushed stone or gravel complying with ASTM D 448 for Size No. 8.

1. No. 8 stone color to match the color of Belgian Blocks

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Extra care shall be taken when installing granite Belgian Blocks to prevent damage or injury to street trees and flowering trees at the entrance during construction.

B. Do not use unit pavers with chips, cracks, voids, discolorations, and other defects that might be structurally unsound or visible in finished work.

C. Care shall be taken so that no damage occurs to the pavers during handling. All pavers shall be free of foreign matter before installation.

D. Provide edge restraints as indicated. Install edge restraints before placing unit pavers.

E. Appropriate ground prep tool is required for soil preparation. All installations require gloves, a hammer or rubber mallet, and a cutting tool.

F. Setting bed material shall be stored with a waterproof covering to prevent exposure to rainfall.

G. Schedule and coordinate work to permit other subcontractors to install their work prior to installing the concrete sand setting bed and the pavers.

H. Cut unit pavers with motor-driven masonry saw equipment or a block splitter to provide clean, sharp, unchipped edges. Cut units to provide pattern indicated and to fit adjoining work neatly. Use full units without cutting where possible. Hammer cutting is not acceptable.

I. Tolerances:

1. Variation in Plane between Adjacent Units (Lipping): Do not exceed 1/16-inch (1.5-mm) unit-to-unit offset from flush.
2. Variation from Level: Do not exceed 1/8 inch in 24 inches (3 mm in 600 mm) and 1/4 inch in 10 feet (6 mm in 3 m).

3.2 SETTING-BED INSTALLATION

A. Spread No. 2 stone as the subbase material in 6” think lift. Compact the No. 2 stone with a static roller made of 10 ton steel drum roller. The roller should be in vibratory mode for the first few passes and static mode (no vibration) for the final passes.

B. Spread the No. 57 base layer over No. 2 stone and compact it as one 4” lift with a heavy plate compactor. Moist stone surfaces to make compacting a bit easier.

C. When al lifts are compacted, the surface shall be convered with a 2” thick layer of moist No. 8 crushed stone. Screed and level No. 8 stone over No.57 stones base. No. 8 stone shall not be compacted. The surface tolerance of the screeded No. 8 stone shall be ½” over 10 feet.

D. Construction equipment and foot traffic shall be kept off the screeded layer.

3.3 PAVER INSTALLATION

A. Set unit pavers on leveling course. Be careful not to disturb leveling base. Place pavers with a 1/16-inch minimum and 1/8-inch maximum joint width.

B. Compact pavers into leveling course with a low-amplitude plate vibrator capable of a 3500- to 5000-lbf compaction force at 80 to 90 Hz.

C. Place graded aggregate, No. 8 stones, fill immediately after vibrating pavers into leveling course. Spread and screed aggregate fill level with tops of pavers.

D. Remove and replace pavers that are loose, chipped, broken, stained, or otherwise damaged or that do not match adjoining units. Provide new units to match adjoining units and install in same manner as original units, with same joint treatment and with no evidence of replacement.

END OF SECTION 32 14 43

SECTION 32 16 00 - CURBS, GUTTERS, SIDEWALKS, AND DRIVEWAYS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 – General Requirements Specification Sections, apply to this Section.

B. City of Baltimore: Department of Public Works – *Specifications For Materials, Highways, Bridges, Utilities, and Incidental Structures* with all addenda thereto at the time bids are received (DPW Standard Specifications.) Subsections of DPW Standard Specifications describing “Measurement and Payment” shall not apply to this contract.

C. City of Baltimore: Department of Transportation – *Book of Standards* with all addenda thereto at the time bids are received (DOT Standards.) Subsections of DOT Standards describing “Measurement and Payment” shall not apply to this contract.

D. American Society of Testing and Materials International (ASTM) standards and test methods.

E. American Concrete Institute Standard (ACI) – Manual of Concrete Practice with all addenda thereto at the time bids are received.

1.2 SUMMARY

A. Section includes concrete and reinforcing materials and work required for the construction of the following:

1. Cast-in-Place: Curbs, Gutters, Sidewalks and Driveways situated in the City of Baltimore Right-of-way or Easement.

B. Related Requirements:

1. Section 31 20 00 – Earth Moving.
2. Section 32 17 00 – Pavement Specialties.
3. Section 33 10 00 – Water Utilities.
4. Section 33 40 00 – Storm Drainage Utilities.
5. Section 33 31 00 – Sanitary Sewer Utilities.
6. Section 32 10 00 – Bases, Ballast, and Paving.

1.3 SUSTAINABLE DESIGN REQUIREMENTS

A. SSc7.1 Reduction of Heat Island Effect - Non-Roof Surfaces

1. All concrete mixes and precast pavers identified as high SRI in the Plans used for exterior paving shall have a Solar Reflective Index rating (SRI) of 29 or greater in accordance with the project requirements for Reduction of Heat Island

Effect - Non-Roof Surfaces. See Section 01 81 13 – Sustainable Design Requirements

2. Contractor shall provide LEED credit verification as per Section 01 33 00 – Submittal Procedures.

B. MRc2: Construction Waste Management

No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 01 81 13 – Sustainable Design Requirements.

C. MRc4: Recycled Content Material

No less than the specified minimum proportion of the building materials shall contain post-consumer and pre-consumer waste materials in accordance with the project requirements for Recycled Content Materials. All materials counted toward the computation of the proportion of the Recycled Content Materials shall comply with the standard for the minimum percentages of post-consumer waste materials and for the minimum percentage of pre-consumer waste materials. See Section 01 81 13 – Sustainable Design Requirements.

Contractor shall provide LEED credit verification as per Section 01 33 00 – Submittal Procedures.

D. MRc5: Regionally manufactured harvested materials

1. No less than the specified proportion of the building materials shall be extracted, processed, and manufactured within 500 miles of the project site in accordance with the project requirements for Regionally Manufactured and/or Harvested Materials. See Section 01 81 13 – Sustainable Design Requirements.
2. Contractor shall provide LEED credit verification as per Section 01 33 00 – Submittal Procedures.

1.4 ACTION SUBMITTALS

A. General: Provide submittals in compliance with General Conditions of the Contract and Division 01 – General Requirements.

B. Concrete Mix Design:

1. Submit mix design for all classes of concrete to the Agency Construction Manager for review and approval. Do not order or place any concrete before the mix design is approved.
2. Submit certified laboratory test reports for mix design test and aggregates.
3. Post placement testing at the seven (7) day and twenty-eight (28) day intervals shall be given to the Agency Construction Manager for review and acceptance.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Delivery:

1. Schedule delivery operations to avoid unnecessary re-handling.

B. Storage:

1. Store materials in accordance with manufacturer's recommendations.

1.6 PROJECT CONDITIONS

A. Limitations:

1. Underground Utilities:

a. Do not proceed with concrete pavement construction until all underground utility construction is complete, passed testing and accepted by the Agency Construction Manager.

2. Environmental:

a. All provisions of ACI 306R shall be followed for cold weather concrete placement and ACI 305R for hot weather concrete placement.

1.7 CONSTRUCTION SURVEYS

A. See Division 01 – General Requirements.

B. Provide combined horizontal and vertical alignment stakes for construction of curbs, gutters, sidewalks and/or driveways on a continuous slope at intervals of 50-foot maximum and/or

C. Provide combined horizontal and vertical alignment stakes for construction of curbs, gutters, sidewalks and/or driveways on curves at 25-foot maximum and/or

D. Provide alignment stakes at all horizontal angle points.

PART 2 - PRODUCTS

2.1 PORTLAND CEMENT CONCRETE

A. Portland cement concrete shall be in accordance with Division 03 – Concrete of the DPW Standard Specifications

2.2 CONCRETE REINFORCEMENT

A. Plain Carbon-Steel Bars, ASTM A 615, Grade 60, diameter, length and configuration as indicated on the Contract Drawings and in accordance with DPW Standard Specifications and DOT Standards.

B. Deformed Bars, ASTM A 615, Grade 60, diameter, length and configuration as indicated on the Contract Drawings and in accordance with DPW Standard Specifications and DOT Standards.

C. Welded Wire Reinforcement, ASTM A 185, gauge and size as indicated on the Contract Drawings and in accordance with DPW Standard Specifications and DOT Standards.

2.3 JOINT MATERIALS

A. Expansion and Isolation Joints, ASTM D 994.

1. Type: Bituminous preformed joint filler.
2. Nominal Thickness:

a. Isolation Joints: 1/2-inch.
b. Expansion Joints: 3/4-inch.

2.4 CONCRETE MIXES

A. Concrete Mix No. 2:

1. 28-day Compressive Strength: 3,000 psi.
2. Air Entrainment: 5 - 8%.
3. Mix Contents:

a. Portland Cement: 6-1/2 bags (611 lbs.) per cubic yard.
b. Water: 5-1/4 gallons per bag of cement.

4. Slump Range: 2 - 5 inches.
5. Solar Reflex Index : 29 or higher (when exposed to surface)

B. Concrete Mix No. 6:

1. 7-day Compressive Strength: 3,000 psi.
2. 28-day Compressive Strength: minimum of 4,500 psi.
3. Air Entrainment: 5 - 8%.
4. Mix Contents:

a. Portland Cement Concrete: 7-1/2 bags (705 lbs.) per cubic yard.
b. Water: 5 gallons per bag of cement.

5. Slump: 2 - 4 inches.
6. Solar Reflex Index : 29 or higher (when exposed to the surface).

2.5 CURING MATERIAL

A. Mat Method:

1. Burlap Mats: AASHTO M 182, Class 1.

B. Sheeting Method:

1. Waterproof Paper: ASTM C 171, white type.
2. Polyethylene Film: ASTM C 171, white opaque, 8 mill thick

C. Liquid membrane forming curing materials are prohibited.

2.6 AGGREGATE BASE

A. Graded Aggregate Sub-base (GAB): Graded aggregate for sub-base courses shall meet the gradation requirements of ASTM D 2940 for sub-base. In addition, that material shall meet all the other requirements listed in Division 32 of the DPW Standard Specifications. The granular Base shall be an evenly graded mixture of fine and coarse aggregates to provide, when compacted, a smooth and even surface.

2.7 GEOTEXTILE FABRICS

A. Class: ST

1. Properties

a.	Type	WOVEN	
b.	Grab Strength (min 15% elongation)	300 lb	ASTM D 4632
c.	Puncture Strength	100 lb	ASTM D 6241
d.	Permittivity	0.05 sec^{-1}	ASTM D 4491
e.	Apparent Opening Size (min)	0.15 mm	ASTM D 4751
f.	Trapezoid Tear Strength	110 lb	ASTM D 4533

2. All property values are based on minimum average roll values in the weakest principle direction.
3. The ultraviolet stability shall be 50 percent after 500 hours of exposure.

PART 3 - EXECUTION

3.1 EXECUTION

A. Excavate, at the locations shown on the Contract Drawings for curbs, gutters, sidewalks and/or driveways.

B. Promptly repair slides, slip-outs, wash-outs, settlements, and subsidence which occur for any reasons and re-finish to the correct lines and grades.

C. Remove all unsuitable material located below the limits of excavation and back-fill as specified in Section 31 20 00 – Earth Moving.

D. Place material on prepared sub-grade to depth required to produce compacted thickness indicated on Contract Drawings.

E. Prepare sub-grade for curbs, gutters, sidewalks and/or driveways as specified in Section 31 20 00 – Earth Moving.

F. Verify utility casting elevations and reset or adjust castings to meet flush with finished surfaces of sidewalks and/or driveways. Adjust casting for cross slope, if any.

G. If the Contractor determines that any casting will be located in a curb and/or gutter then prior to the placement of concrete the Contractor shall notify and obtain remediation measures from the Agency Construction Manager.

3.2 BASE COURSE

A. Place a Woven Geotextile Class: ST on top of prepared subgrade, where noted on the Contract Drawings. Place base course on Geotextile to depth required to produce compacted thickness indicated on Contract Drawings.

B. Compact to 95% of the maximum dry density determined in accordance with ASTM D 1557.

3.3 EXPANSION JOINTS

A. Install expansion joints at 30-foot intervals, or as indicated on Contract Drawings.

B. Place expansion joints perpendicular to concrete surface.

C. Place expansion joints with top edge 1/4-inch below concrete surface, unless otherwise noted on the Contract Documents.

3.4 CONTRACTION JOINTS

A. Provide contraction joints at 10-foot intervals, or as indicated on the Contract Drawings.

B. Form contraction joints, perpendicular to concrete surface, with removable 1/8 inch form spreader plates or tool joint with a 1-inch jointing tool.

3.5 ISOLATION JOINTS

A. Install isolation joints where concrete abuts buildings, walls, utility structures, foundations, and castings.

B. Place isolation joint with top edge 1/4-inch below concrete surface.

3.6 CONCRETE PLACEMENT

A. Place concrete carefully to prevent joint material dislocation.

B. Consolidate concrete by tamping or vibrating to prevent honeycomb.

3.7 FINISHING

A. Strike off top surfaces to top of forms and to a smooth and uniform texture.

B. Finish edges and joints with 1/8-inch radius edging tool.

C. Provide broom finish or as directed on the Contract Drawings.

D. Maintain forms in place for a minimum of 12 hours after concrete placement.

E. Correct defects (e.g., holes, honeycomb, broken edges, etc.) upon removal of forms with cement mortar unless directed otherwise by the Agency Construction Manager, at no increase to the Contract Sum.

3.8 CURING:

A. Mat Method:

1. Moisten mats thoroughly with water before placing on concrete.
2. Place mats on exposed concrete surfaces with 6 inch joint overlaps.
3. Maintain mats in continuously moist condition for 7 calendar days.
4. Repair or replace damaged mats.

B. Sheeting Method:

1. Moisten concrete surface with a fine spray of water before sheeting placement.
2. Place sheeting on exposed concrete surfaces with light-colored side up and 12 inch joint overlaps.
3. Anchor sheeting securely in place.
4. Maintain sheeting in place for seven (7) calendar days.
5. Repair or replace damaged sections of sheeting.

3.9 INSPECTION AND TESTING:

A. The Contractor's Construction Inspection Testing Firm shall inspect the placement of concrete and perform tests in accordance with Division 01 – General Requirements and this Section of these specifications. The inspection and testing shall include the following:

1. Inspect excavation and form-work prior to the placement of concrete.
2. Inspect the placement of base course.
3. Perform base course laboratory tests.

    a. Moisture-Density Relationship Test Method: ASTM D 1557 and ASTM D 4253.
    b. Gradation Tests: ASTM C 136.
    c. Testing Frequency: one (1) for each type of base course material submitted for use by the Contractor.

4. Perform base course in place density tests.

    a. Test Method: ASTM D 1556 or ASTM D 3017.
    b. Frequency of Test: one (1) for every 200 linear feet of base course.

5. Inspect all reinforcement to assure proper placement, cover, number of bars, adequately tied and conforms to all of the Contract Documents.

6. Inspect concrete placement.
7. Sample and test concrete.

    a. Slump Test:

        1) Test Method: ASTM C 143/C 143M.
        2) Testing Frequency: one (1) per truck load.

b. Air Content Test:

1) Test Method: ASTM C 231.
2) Testing Frequency: one (1) for every fifty cubic yards (50 cy) of concrete placed with a minimum of one (1) for each work day concrete is placed.

c. Make cylindrical test specimens.

1) Test Method: ASTM C 31C 31M.
2) Testing Frequency: one (1) set of four (4) for every fifty cubic yards (50 cy) of concrete placed with a minimum of a set of 4 for each day concrete is placed.

d. Compressive Strength of Concrete Cylinders:

1) Test Method: ASTM C 39.
2) Testing Frequency: two (2) at seven (7) days and two (2) at twenty-eight (28) days after molding.

8. Mowing Strip and Pavement Surface Smoothness Test:

a. Tolerance: Not to exceed 3/8-inch between any two (2) surface contacts on a ten foot (10 ft) straight-edge.
b. Test Locations: Random and as determined by the representative of the Contractors Construction Inspection Test Firm.

B. In the event that the compressive strength of any concrete cylinder falls below the specified strength, the test results shall be analyzed in accordance with the ACI Manual of Concrete Practice (ACI 214) by the Contractors Construction Inspection Test Firm. The results of the analysis shall be provided to the Agency Construction Manager . The Contractor shall obtain core samples of the concrete, if directed by the Agency Construction Manager, at no increase to the Contract Sum. The core samples shall be collected in accordance with ASTM C 42 and the samples shall be tested by the Contractors Construction Inspection Test Firm in accordance with ASTM C 39.

C. The Contractor shall provide delivery tickets for each truck load of concrete to the Contractors Construction Inspection Test Firm. The ticket shall indicate the name of the concrete supplier, mix design of the concrete, whether the concrete is ready mix or transit mix, time of mixing, and volume of concrete.

D. The Contractor shall provide a 10-foot straight-edge for performing concrete surface smoothness tests.

3.10 CORRECTIVE WORK:

A. All work not conforming to the Contract Documents (drawings and specifications) shall be corrected by the Contractor as directed by the Agency Construction Manager at no increase to the Contract Sum.

END OF SECTION 32 05 23

SECTION 32 17 00 – PAVEMENT SPECIALTIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. City of Baltimore: Department of Public Works – *Specifications For Materials, Highways, Bridges, Utilities, and Incidental Structures* with all addenda thereto at the time bids are received (DPW Standard Specifications.) Subsections of DPW Standard Specifications describing "Measurement and Payment" shall not apply to this contract.

C. City of Baltimore: Department of Transportation – *Book of Standards* with all addenda thereto at the time bids are received (DOT Standards.) Subsections of DOT Standards describing "Measurement and Payment" shall not apply to this contract.

D. American Society of Testing and Materials International (ASTM) standards and test methods.

E. American Association of State Highway and Transportation Officials (AASHTO) *Standard Specifications for Transportaiton Mterails and Methods of Sampling and Testing* and *A policy of Geometric Design of Highways and Streets*.

F. Federal Highway Administration – *Manual on Uniform Traffic Control Devices* (MUTCD.)

1.2 SUMMARY

A. Section includes:

1. Pavement markings
2. Precast Concrete Parking Bumpers.

B. Related Requirements:

1. Section 32 10 00 – Bases, Ballast, and Paving.
2. Section 32 05 23 – Cement and Concrete for Exterior Improvements.

C. Description

1. Selected materials and method for the work in this section are in accordance with the applicable provisions of the DPW Standard Specifications. Subsections of the DPW Standard Specifications describing "Measurement and Payment" shall not apply to this work.

1.3 SUSTAINABLE DESIGN REQUIREMENTS

A. SSc7.1 Reduction of Heat Island Effect - Non-Roof Surfaces

1. All concrete mixes and precast pavers identified as high SRI in the Plans used for exterior paving shall have a Solar Reflective Index rating (SRI) of 29 or greater in accordance with the project requirements for Reduction of Heat Island Effect - Non-Roof Surfaces. See Section 01 81 13 – Sustainable Design Requirements.
2. Contractor shall provide LEED credit verification as per Section 01 33 00 – Submittal Procedures.

B. MRc2: Construction Waste Management

1. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 01 81 13 – Sustainable Design Requirements.

C. MRc4: Recycled Content Material

1. No less than the specified minimum proportion of the building materials shall contain post-consumer and pre-consumer waste materials in accordance with the project requirements for Recycled Content Materials. All materials counted toward the computation of the proportion of the Recycled Content Materials shall comply with the standard for the minimum percentages of post-consumer waste materials and for the minimum percentage of pre-consumer waste materials. See Section 01 81 13 – Sustainable Design Requirements.
2. Contractor shall provide LEED credit verification as per Section 01 33 00 – Submittal Procedures.

D. MRc5: Regionally manufactured harvested materials

1. No less than the specified proportion of the building materials shall be extracted, processed, and manufactured within 500 miles of the project site in accordance with the project requirements for Regionally Manufactured and/or Harvested Materials. See Section 01 81 13 – Sustainable Design Requirements.
2. Contractor shall provide LEED credit verification as per Section 01 33 00 – Submittal Procedures.

1.4 SUBMITTALS

A. Certificates

1. Materials

1.5 PROJECT CONDITIONS

A. The Maintenance of Traffic, vehicular and pedestrian, must be provided in accordance with Sections 01 55 26, 01 55 27, and 01 55 28 of the DPW Standard Specifications, and as allowed by the City of Baltimore.

PART 2 - PRODUCTS

2.1 MATERIALS:

A. Pavement Operations and Maintenance: See DPW Standard Specifications, Section 32 01 00.

B. Concrete: See DPW Standard Specification, Section 32 13 00.

C. Pavement Marking: See DPW Standard Specification, Section 32 17 23.

D. Precast Concrete Parking Bumpers shall be furnished as detailed on the Contract Drawings.

PART 3 - EXECUTION

3.1 MAINTENANCE OF TRAFFIC:

A. The Contractor shall be responsible for the Maintenance of Traffic (MOT), pedestrian and vehicular, on all public and private roads while working on or near such roads and within the project site as required for this project for safe and continuous maintenance of traffic throughout the area affected by the project work. All cost associated with the maintenance of traffic, pedestrian and vehicular, shall be included in the base bid. Items used for MOT shall be removed from the project site when no longer needed.

B. MOT shall be in accordance with DPW Standard Specifications and the latest Manual on Uniform Traffic Control Devices (MUTCD), and as directed by the City of Baltimore.

3.2 PAVEMENT MARKING REMOVAL:

A. Remove pavement markings, as required and as indicated on Contract Drawings, in a manner acceptable to Agency Construction Manager and the City of Baltimore.

3.3 PAVEMENT MARKING PROTECTION AND RESTORATION:

A. Do not permit vehicular or pedestrian traffic on completed marked pavement until paint or other marking materials has set and are hardened.

B. Restore damaged paint marking as directed by the Agency Construction manager and the City of Baltimore.

3.4 PAVEMENT MARKING APPLICATION:

A. Apply pavement markings to the pavement conforming to MUTCD, AASHTO, DPW Standard Specifications, and DOT Standards.

B. Preparation:

1. Clean pavement surface removing loose material, grease, oil, mud, and foreign materials.
2. Allow pavement to cool and set for 5 calendar days prior to application of paint.
3. Do not apply paint to a wet or damp surface. Allow surface to dry an additional 8 hours after appearing dry.
4. Lay out markings to dimensions indicated on Contract Drawings.

C. Application:

1. Apply paint with spray equipment, producing markings with sharp parallel edges, clean square ends, and with uniform width of 4 inches.
2. Application rate shall be no less than 100 square feet per gallon.

3.5 PRECAST PARKING BUMPERS

A. Precast Parking Bumpers shall be installed in each parking space as shown on the Contract Drawings. The bumpers shall be placed centered from left to right in each space and four feet from the end, opposite of the drive aisle, of the parking space.

3.6 INSPECTION AND TESTING:

A. The inspection and testing of all work specified in this Section shall be performed by the Inspection and Testing Agency in accordance with Division 01 – General Requirements.

B. All work not conforming to the Contract Drawings and the Contract specifications shall be corrected by the Contractor to the satisfaction of the Agency Construction Manager at no increase to the Contract Sum.

3.7 CLEANING:

A. See Division 01 – General Requirements.

B. Clean improvements and facilities damaged by paint over-spray, as directed by the Agency Construction Manager at no increase to the Contract Sum.

END OF SECTION 32 17 00

SECTION 32 17 26 – TACTILE WARNING SURFACE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 – General Requirements Specification Sections, apply to this Section.

B. City of Baltimore: Department of Public Works – *Specifications For Materials, Highways, Bridges, Utilities, and Incidental Structures* with all addenda thereto at the time bids are received (DPW Standard Specifications.) Subsections of DPW Standard Specifications describing "Measurement and Payment" shall not apply to this contract.

C. City of Baltimore: Department of Transportation – *Book of Standards* with all addenda thereto at the time bids are received (DOT Standards.) Subsections of DOT Standards describing "Measurement and Payment" shall not apply to this contract.

D. American Society of Testing and Materials International (ASTM) standards and test methods.

E. American Association of State Highway and Transportation Officials (AASHTO) *Standard Specifications for Transportaiton Mterails and Methods of Sampling and Testing* and *A policy of Geometric Design of Highways and Streets*.

F. Federal Highway Administration – *Manual on Uniform Traffic Control Devices* (MUTCD.)

G. United States of America: *Americans with Disabilities ACT* with all addenda thereto at the time bids are received (ADA).

1.2 SUMMARY

A. Section includes materials and specifications for the installation of tactile (detectable) warning surfaces.

B. Related Requirements:

1. Section 32 10 00 – Bases, Ballast, and Paving.
2. Section 32 05 23 – Cement and Concrete for Exterior Improvements.
3. The tactile (detectable) warning surface shall conform to the most recent accessibility guidelines of the Americans with Disabilities Act (ADA) under Section R304 of the Public Rights-of-Way guidelines.

C. Description

1. Selected materials and method for the work in this section are in accordance with the applicable provisions of the DPW Standard Specifications. Subsections of the DPW Standard Specifications describing "Measurement and Payment" shall not apply to this work.

2. Detectable warning surfaces are required at street crossings and signalized intersections and wherever sidewalk ramps are installed.
3. The work includes the removal and disposal of the existing sidewalk or other materials necessary for the construction and installation of the detectable warning surfaces.

1.3 SUSTAINABLE DESIGN REQUIREMENTS

A. SSc7.1 Reduction of Heat Island Effect - Non-Roof Surfaces

1. All concrete mixes and precast pavers identified as high SRI in the Plans used for exterior paving shall have a Solar Reflective Index rating (SRI) of 29 or greater in accordance with the project requirements for Reduction of Heat Island Effect - Non-Roof Surfaces. See Section 01 81 13 – Sustainable Design Requirements.
2. Contractor shall provide LEED credit verification as per Section 01 33 00 – Submittal Procedures.

B. MRc2: Construction Waste Management

1. No less than the specified minimum proportion of all construction waste from the project shall be diverted from disposal in a landfill and/or incineration in accordance with the project requirements for Construction Waste Management. See Section 01 81 13 – Sustainable Design Requirements.

C. MRc4: Recycled Content Material

1. No less than the specified minimum proportion of the building materials shall contain post-consumer and pre-consumer waste materials in accordance with the project requirements for Recycled Content Materials. All materials counted toward the computation of the proportion of the Recycled Content Materials shall comply with the standard for the minimum percentages of post-consumer waste materials and for the minimum percentage of pre-consumer waste materials. See Section 01 81 13 – Sustainable Design Requirements.
2. Contractor shall provide LEED credit verification as per Section 01 33 00 – Submittal Procedures.

D. MRc5: Regionally manufactured harvested materials

1. No less than the specified proportion of the building materials shall be extracted, processed, and manufactured within 500 miles of the project site in accordance with the project requirements for Regionally Manufactured and/or Harvested Materials. See Section 01 81 13 – Sustainable Design Requirements.
2. Contractor shall provide LEED credit verification as per Section 01 33 00 – Submittal Procedures.

1.4 SUBMITTALS

A. Certificates

1. Materials

1.5 PROJECT CONDITIONS

A. Maintenance of Traffic, vehicular and pedestrian, must be provided in accordance with Sections 01 55 26, 01 55 27, and 01 55 28 of the DPW Standard Specifications, DOT Standards and as allowed by City of Baltimore.

PART 2 - PRODUCTS

2.1 MATERIALS:

A. Tactile (Detectable) Warning Surface

1. Composition: The surface shall be of rigid composition
2. Size: The surface standard size shall have a minimum side distance of 24” in the direction of pedestrian travel and extend the full width of the curb ramp landing. The detectable warning surface shall not encroach on the blended slope transition areas.
3. Shape: The system shall consist of a surface of truncated domes aligned in a square grid pattern as specified in the Contract Documents or as directed by the Engineer.

    a. The domes shall be 0.2” in height and 0.9” to 1.4” in diameter.
    b. The domes shall be spaced perpendicularly 1.6” to 2.35” from center of domes.
    c. Truncated dome surfaces shall be fabricated to provide full domes only.

4. Color: The detectable warning surfaces shall contrast visually with adjacent - gutter, street or highway, or walkway surfaces, either light-on-dark or dark-on-light.
5. Friction: The surfaces shall have a minimum coefficient of friction of 0.8 when tested in conformance with ASTM C 1028.

PART 3 - EXECUTION

3.1 MAINTENANCE OF TRAFFIC:

A. The Contractor shall be responsible for the Maintenance of Traffic (MOT), pedestrian and vehicular, on all public and private roads while working on or near such roads and within the project site as required for this project for safe and continuous maintenance of traffic throughout the area affected by the project work. All cost associated with the MOT, pedestrian and vehicular, shall be included in the base bid.

B. Items used for maintenance of traffic shall be removed from the project site when no longer needed.

C. MOT shall be in accordance with DPW Standard Specifications and the latest Manual on Uniform Traffic Control Devices (MUTCD), DOT Standards and as directed by the City of Baltimore.

3.2 TACTILE (DETECTABLE) WARNING SURFACE INSTALLATION

A. The tactile (detectable) warning surfaces shall be either surface applied or cast in place.

B. The Contractor shall install the system in conformance with the manufacturer's recommendations. These recommendations shall address the conditions of the concrete surface on which the system will be applied; surface finish, presence of curing compound, length of cure, and other installation practices to ensure the longevity of the detectable warning surfaces.

C. The detectable warning surface shall be located so that the edge nearest the curb line is 6" – 8" from the face of curb. For skewed applications, detectable warning surfaces shall be placed such that the domes closest to the back of curb are no less than 0.5" and no more than 1" from the back of curb. Truncated dome surfaces shall be fabricated to provide full domes only.

3.3 INSPECTION AND TESTING:

A. The inspection and testing of all work specified in this Section shall be performed by the Inspection and Testing Agency in accordance with Division 01 – General Requirements.

B. All work not conforming to the drawings and these specifications shall be corrected by the Contractor to the satisfaction of the Agency Construction Manager at no increase to the Contract Sum.

3.4 CLEANING:

A. See Division 01 – General Requirements.

END OF SECTION 32 17 00

SECTION 32 31 13.53 - HIGH-SECURITY FENCES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Steel high-security fences.

B. Related Requirements:
1. Division 04 Section “Unit Masonry” for brick wall

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for the following:

a. Fence rails, and fittings.

B. Shop Drawings: For each type of fence and gate assembly.

1. Include plans, elevations, sections, details, and attachments to other work.

C. Samples for Initial Selection: For each type of factory-applied finish.

D. Samples for Verification: For each type of component with factory-applied finish, prepared on Samples of size indicated below:

1. Polymer-Coated Components: In 6-inch (150-mm) lengths for components and on full-sized units for accessories.

E. Delegated-Design Submittal: For structural performance of chain-link fence and gate frameworks, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.4 QUALITY ASSURANCE

A. Testing Agency Qualifications: For testing fence grounding; member company of NETA or an NRTL.

1. Testing Agency's Field Supervisor: Certified by NETA to supervise on-site testing.

1.5 FIELD CONDITIONS

A. Field Measurements: Verify layout information for chain-link fences and gates shown on Drawings in relation to property survey and existing structures. Verify dimensions by field measurements.

1.6 WARRANTY

A. All structural fence components (i.e. rails, pickets, and posts) shall be warranted within specified limitations, by the manufacturer for a period of 15 years. Warranty shall cover any defects in material finish, including cracking, peeling, chipping, blistering or corroding.

PART 2 - PRODUCTS

2.1 STEEL FENCE

A. Basis-of-Design Product: Subject to compliance with requirements, provide Impasse II-Gauntlet as manufactured by Ameristar. or a comparable product by one of the following:
1. Long Fence
2. Hercules Fence

2.2 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 014000 "Quality Requirements," to design chain-link fence and gate frameworks.

B. Structural Performance: Chain-link fence shall withstand the design wind loads and stresses for fence height(s) and under exposure conditions indicated according to ASCE/SEI 7:

1. Design Wind Load: As indicated on Drawings.

a. Minimum Post Size and Maximum Spacing: Provide line posts of size and in spacing indicated, but not less than sizes and spacings determined according to CLFMI WLG 2445, based on mesh size and pattern specified.

C. Deflection Limits: Fence deflections shall be within the following limits:

1. Fence Post Rigidity: Maximum 3/4 inch (19 mm) when a 50-lbf (222-N) force is applied at midheight of every eighth post along the fence line. Measure post movement from the relaxed position at the point where the force is applied.

2.3 MATERIALS

A. Steel material for fence framework when galvanized prior to forming, shall conform to the requirements of ASTM A924/A924M, with a minimum yield strength of 45,000 psi (310 MPa). The steel shall be hot-dip galvanized to meet the requirements of ASTM A653/A653M with a minimum zinc coating weight of 0.90 oz/ft^2 (276 g/m^2), Coating Designation G-90.

2.4 FITTINGS

A. Provide fittings according to ASTM F 626.

B. Post Caps: Provide for each post.

1. Provide line post caps with loop to receive tension wire or top rail.

C. Rail and Brace Ends: For each gate, corner, pull, and end post.

D. Rail Fittings: Provide the following:

1. Top-Rail Sleeves: Pressed-steel or round-steel tubing not less than 6 inches (152 mm) long.
2. Rail Clamps: Line and corner boulevard clamps for connecting intermediate and bottom rails to posts.

E. Tension and Brace Bands, Tension Bars, and Truss Rod Assemblies: According to ASTM F 2611.

F. Power-Driven Fabric Fasteners: As recommended in writing by manufacturer.

G. Finish:

1. Metallic Coating for Pressed Steel or Cast Iron: Not less than 1.2 oz. /sq. ft. (366 g/sq. m) of zinc.

a. Polymer coating over metallic coating.

2. Aluminum: Mill finish.

2.5 GROUT AND ANCHORING CEMENT

A. Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107/C 1107M. Provide grout, recommended in writing by manufacturer, for exterior applications.

B. Anchoring Cement: Factory-packaged, nonshrink, nonstaining, hydraulic-controlled expansion cement formulation for mixing with water at Project site to create pourable anchoring, patching, and grouting compound. Provide formulation that is resistant to erosion from water exposure without needing protection by a sealer or waterproof coating, and that is recommended in writing by manufacturer for exterior applications.

PART 3 - EXECUTION

3.1 CHAIN-LINK FENCE INSTALLATION

A. Install chain-link fencing according to ASTM F 567 and more stringent requirements specified.

B. Verify that posts are set plumb, aligned, and at correct height and spacing, and hold in position during setting with concrete or mechanical devices.

C. Terminal Posts: Install terminal end, corner, according to ASTM F 567 and terminal pull posts at changes in horizontal or vertical alignment of 15 degrees or more, at any abrupt change in grade, and at intervals not greater than 500 feet (152 m). For runs exceeding 500 feet (152 m), space pull posts an equal distance between corner or end posts..

Post Bracing and Intermediate Rails: Install according to ASTM F 567, maintaining plumb position and alignment of fence posts.

D. Tension Wire: Install according to ASTM F 567, maintaining plumb position and alignment of fence posts. Pull wire taut, without sags. Fasten fabric to tension wire with 0.120-inch- (3.05-mm-) diameter hog rings of same material and finish as fabric wire, spaced a maximum of 24 inches (610 mm) o.c. Install tension wire in locations indicated before stretching fabric. Provide horizontal tension wire at the following locations:

E. Top Rail: Install according to ASTM F 567, maintaining plumb position and alignment of fence posts. Run rail continuously through line post caps, bending to radius for curved runs and terminating into rail end attached to posts or post caps fabricated to receive rail at terminal posts. Provide expansion couplings as recommended in writing by fencing manufacturer.

F. Bottom Rails: Secure to posts with fittings; anchor rail at midspan to concrete brick wall.

G. Tie Wires: Power-fastened or manually fastened ties configured to wrap a full 360 degrees around rail or post and a minimum of one complete diamond of fabric. Twist ends one and one-half machine twists or three full manual twists, and cut off protruding ends to preclude untwisting by hand.

H. Fasteners: Install nuts for tension bands and carriage bolts on the side of fence opposite the fabric side. Peen ends of bolts or score threads to prevent removal of nuts.

I. Provisions for Electronic Detection System: Eliminate wind-induced vibrations and rattles of fabric against posts and rails by placing additional tie wires where necessary. Eliminate rattles from bolted end fittings and other component connections by applying additional tightening or diagonal truss rods secured to fabric with tie wires.

ND OF SECTION 323113.53

SECTION 32 93 00 - PLANTS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Plants.
2. Planting soils.

1.2 DEFINITIONS

A. Backfill: The earth used to replace or the act of replacing earth in an excavation.

B. Duff Layer: The surface layer of native topsoil that is composed of mostly decayed leaves, twigs, and detritus.

C. Finish Grade: Elevation of finished surface of planting soil.

D. Manufactured Topsoil: Soil produced off-site by homogeneously blending mineral soils or sand with stabilized organic soil amendments to produce topsoil or planting soil.

E. Pesticide: A substance or mixture intended for preventing, destroying, repelling, or mitigating a pest. This includes insecticides, miticides, herbicides, fungicides, rodenticides, and molluscicides. It also includes substances or mixtures intended for use as a plant regulator, defoliant, or desiccant.

F. Pests: Living organisms that occur where they are not desired, or that cause damage to plants, animals, or people. These include insects, mites, grubs, mollusks (snails and slugs), rodents (gophers, moles, and mice), unwanted plants (weeds), fungi, bacteria, and viruses.

G. Planting Soil: Standardized topsoil; existing, native surface topsoil; existing, in-place surface soil; imported topsoil; or manufactured topsoil that is modified with soil amendments and perhaps fertilizers to produce a soil mixture best for plant growth.

H. Root Flare: Also called "trunk flare." The area at the base of the plant's stem or trunk where the stem or trunk broadens to form roots; the area of transition between the root system and the stem or trunk.

I. Subgrade: Surface or elevation of subsoil remaining after excavation is complete, or the top surface of a fill or backfill before planting soil is placed.

J. Subsoil: All soil beneath the topsoil layer of the soil profile, and typified by the lack of organic matter and soil organisms.

K. Surface Soil: Soil that is present at the top layer of the existing soil profile at the Project site. In undisturbed areas, the surface soil is typically topsoil; but in disturbed areas such as urban environments, the surface soil can be subsoil.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated, including soils.

B. Samples of mineral mulch and shredded hardwood mulch.

C. Product certificates.

D. Maintenance Instructions: Recommended procedures to be established by Owner for maintenance of plants during a calendar year.

1.4 QUALITY ASSURANCE

A. Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site when work is in progress.

1. Pesticide Applicator: State licensed, commercial.

B. Soil Analysis: For each unamended soil type, furnish soil analysis and a written report by a qualified soil-testing laboratory.

1. The soil-testing laboratory shall oversee soil sampling.
2. Report suitability of tested soil for plant growth.

a. State recommendations for nitrogen, phosphorus, and potash nutrients and soil amendments to be added to produce satisfactory planting soil suitable for healthy, viable plants.
b. Report presence of problem salts, minerals, or heavy metals; if present, provide additional recommendations for corrective action.

C. Provide quality, size, genus, species, and variety of plants indicated, complying with applicable requirements in ANSI Z60.1.

D. Preinstallation Conference: Conduct conference at the site location

1.5 DELIVERY, STORAGE, AND HANDLING

A. Do not prune trees before delivery. Protect bark, branches, and root systems from sun scald, drying, wind burn, sweating, whipping, and other handling and tying damage. Do not bend or bind-tie trees in such a manner as to destroy their natural shape. Provide protective covering of plants during shipping and delivery. Do not drop plants during delivery and handling.

B. Handle planting stock by root ball.

C. Deliver plants after preparations for planting have been completed, and install immediately. If planting is delayed more than six hours after delivery, set plants and trees in their appropriate aspect (sun, filtered sun, or shade), protect from weather and mechanical damage, and keep roots moist.

1.6 WARRANTY

A. Special Warranty: Installer agrees to repair or replace plantings and accessories that fail in materials, workmanship, or growth within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Death and unsatisfactory growth, except for defects resulting from abuse, lack of adequate maintenance, or neglect by Owner, or incidents that are beyond Contractor's control.
b. Structural failures including plantings falling or blowing over.

2. Warranty Periods from Date of Planting Completion Substantial Completion

a. Trees and Ornamental Grasses: 24 months.
b. Perennial: 24 months.

1.7 MAINTENANCE SERVICE

A. Initial Maintenance Service: Provide maintenance by skilled employees of landscape Installer. Maintain as required in Part 3. Begin maintenance immediately after plants are installed and continue until plantings are acceptably healthy and well established but for not less than maintenance period below.

1. Maintenance Period for Trees: 24 months from date of planting completion.
2. Maintenance Period for Other Plants: 24 months from date of planting completion.

PART 2 - PRODUCTS

2.1 PLANT MATERIAL

A. General: Furnish nursery-grown plants true to genus, species, variety, cultivar, stem form, shearing, and other features indicated in Plant Schedule or Plant Legend shown on Drawings and complying with ANSI Z60.1; and with healthy root systems developed by transplanting or root pruning. Provide well-shaped, fully branched, healthy, vigorous stock, densely foliated when in leaf and free of disease, pests, eggs, larvae, and defects such as knots, sun scald, injuries, abrasions, and disfigurement.

B. Root-Ball Depth: Furnish trees and shrubs with root balls measured from top of root ball, which shall begin at root flare according to ANSI Z60.1. Root flare shall be visible before planting.

2.2 INORGANIC SOIL AMENDMENTS

A. Lime: ASTM C 602, agricultural liming material containing a minimum of 80 percent calcium carbonate equivalent and as follows:

1. Class: T, with a minimum of 99 percent passing through No. 8 (2.36-mm) sieve and a minimum of 75 percent passing through No. 60 (0.25-mm) sieve.

2. Class: O, with a minimum of 95 percent passing through No. 8 (2.36-mm) sieve and a minimum of 55 percent passing through No. 60 (0.25-mm) sieve.

B. Sulfur: Granular, biodegradable, and containing a minimum of 90 percent sulfur, with a minimum of 99 percent passing through No. 6 (3.35-mm) sieve and a maximum of 10 percent passing through No. 40 (0.425-mm) sieve.

C. Iron Sulfate: Granulated ferrous sulfate containing a minimum of 20 percent iron and 10 percent sulfur.

D. Aluminum Sulfate: Commercial grade, unadulterated.

E. Perlite: Horticultural perlite, soil amendment grade.

F. Agricultural Gypsum: Minimum 90 percent calcium sulfate, finely ground with 90 percent passing through No. 50 (0.30-mm) sieve.

G. Sand: Clean, washed, natural or manufactured, and free of toxic materials.

H. Diatomaceous Earth: Calcined, 90 percent silica, with approximately 140 percent water absorption capacity by weight.

I. Zeolites: Mineral clinoptilolite with at least 60 percent water absorption by weight.

2.3 ORGANIC SOIL AMENDMENTS

A. Compost: Well-composted, stable, and weed-free organic matter, pH range of 5.5 to 8; moisture content 35 to 55 percent by weight; 100 percent passing through 1/2-inch (13-mm) sieve; soluble salt content of 5 to 10 decisiemens/m; not exceeding 0.5 percent inert contaminants and free of substances toxic to plantings; and as follows:

B. Sphagnum Peat: Partially decomposed sphagnum peat moss, finely divided or granular texture, with a pH range of 3.4 to 4.8.

C. Muck Peat: Partially decomposed moss peat, native peat, or reed-sedge peat, finely divided or of granular texture, with a pH range of 6 to 7.5, and having a water-absorbing capacity of 1100 to 2000 percent.

D. Wood Derivatives: Decomposed, nitrogen-treated sawdust, ground bark, or wood waste; of uniform texture and free of chips, stones, sticks, soil, or toxic materials.

E. Manure: Well-rotted, unleached, stable or cattle manure containing not more than 25 percent by volume of straw, sawdust, or other bedding materials; free of toxic substances, stones, sticks, soil, weed seed, debris, and material harmful to plant growth.

2.4 FERTILIZERS

A. Bonemeal: Commercial, raw or steamed, finely ground; a minimum of 1 percent nitrogen and 10 percent phosphoric acid.

B. Superphosphate: Commercial, phosphate mixture, soluble; a minimum of 20 percent available phosphoric acid.

C. Commercial Fertilizer: Commercial-grade complete fertilizer of neutral character, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea formaldehyde, phosphorous, and potassium in the following composition:

1. Composition: 1 lb/1000 sq. ft. (0.45 kg/92.9 sq. m) of actual nitrogen, 4 percent phosphorous, and 2 percent potassium, by weight.

D. Slow-Release Fertilizer: Granular or pelleted fertilizer consisting of 50 percent water-insoluble nitrogen, phosphorus, and potassium in the following composition:

1. Composition: 20 percent nitrogen, 10 percent phosphorous, and 10 percent potassium, by weight.

E. Planting Tablets: Tightly compressed chip type, long-lasting, slow-release, commercial-grade planting fertilizer in tablet form. Tablets shall break down with soil bacteria, converting nutrients into a form that can be absorbed by plant roots.

1. Size: 5-gram tablets.
2. Nutrient Composition: 20 percent nitrogen, 10 percent phosphorous, and 5 percent potassium, by weight plus micronutrients.

2.5 PLANTING SOILS

A. Planting Soil shall be ASTM D 5268 topsoil, with pH range of 5.5 to 7, a minimum of 2 percent organic material content] [Existing, native surface topsoil formed under natural conditions with the duff layer retained during excavation process or Imported topsoil or manufactured topsoil from off-site sources; do not obtain from agricultural land, bogs or marshes. Verify suitability of soil to produce viable planting soil. Clean soil of roots, plants, sod, stones, clods, clay lumps, pockets of coarse sand, concrete slurry, concrete layers or chunks, cement, plaster, building debris, and other extraneous materials harmful to plant growth. Mix soil with the following soil amendments and fertilizers in the following quantities to produce planting soil:

1. Ratio of Loose Compost to Topsoil by Volume: 1:3
2. Weight of Lime per 1000 Sq. Ft. (92.9 Sq. m):
3. Weight of Sulfur Iron Sulfate Aluminum Sulfate per 1000 Sq. Ft. (92.9 Sq. m):
4. Weight of Agricultural Gypsum per 1000 Sq. Ft. (92.9 Sq. m):
5. Volume of Sand Plus 10 Percent Diatomaceous Earth Zeolites per 1000 Sq. Ft. (92.9 Sq. m):
6. Weight of Bonemeal per 1000 Sq. Ft. (92.9 Sq. m):
7. Weight of Superphosphate per 1000 Sq. Ft. (92.9 Sq. m):
8. Weight of Commercial Fertilizer per 1000 Sq. Ft. (92.9 Sq. m): one pound
9. Weight of Slow-Release Fertilizer per 1000 Sq. Ft. (92.9 Sq. m):

2.6 MULCHES

A. Organic Mulch: Shredded hardwood.

2.7 WEED-CONTROL BARRIERS

A. Nonwoven Geotextile Filter Fabric: Polypropylene or polyester fabric, 3 oz./sq. yd. (101g/sq. m) minimum.

B. Composite Fabric: Woven, needle-punched polypropylene substrate bonded to a nonwoven polypropylene fabric, 4.8 oz./sq. yd. (162 g/sq. m).

2.8 PESTICIDES

A. General: Pesticide registered and approved by EPA, acceptable to authorities having jurisdiction, and of type recommended by manufacturer for each specific problem and as required for Project conditions and application. Do not use restricted pesticides unless authorized in writing by authorities having jurisdiction.

PART 3 - EXECUTION

3.1 PLANTING AREA ESTABLISHMENT

A. Loosen subgrade of planting areas to a minimum depth of 12 inches (300 mm) or as indicated on plans. Remove stones larger than 1 inch (25 mm) in any dimension and sticks, roots, rubbish, and other extraneous matter and legally dispose of them off Owner's property.

1. Apply superphosphate fertilizer directly to subgrade before loosening.
2. Thoroughly blend planting soil off-site before spreading or spread topsoil, apply soil amendments and fertilizer on surface, and thoroughly blend planting soil.
3. Spread planting soil to a depth of as indicated on plans. but not less than required to meet finish grades after natural settlement. Do not spread if planting soil or subgrade is frozen, muddy, or excessively wet.

B. Finish Grading: Grade planting areas to a smooth, uniform surface plane with loose, uniformly fine texture. Roll and rake, remove ridges, and fill depressions to meet finish grades.

3.2 EXCAVATION FOR TREES

A. Planting Pits and Trenches: Excavate circular planting pits with sides sloping inward at a 45-degree angle. Excavations with vertical sides are not acceptable. Trim perimeter of bottom leaving center area of bottom raised slightly to support root ball and assist in drainage away from center. Do not further disturb base. Ensure that root ball will sit on undisturbed base soil to prevent settling. Scarify sides of planting pit smeared or smoothed during excavation.

1. Excavate approximately three times as wide as ball diameter.
2. Excavate at least 12 inches (300 mm) wider than root spread and deep enough to accommodate vertical roots for bare-root stock.
3. Do not excavate deeper than depth of the root ball, measured from the root flare to the bottom of the root ball.

B. Subsoil and topsoil removed from excavations may be used as planting soil.

3.3 TREE

A. Before planting, verify that root flare is visible at top of root ball according to ANSI Z60.1.

B. Remove stem girdling roots and kinked roots. Remove injured roots by cutting cleanly; do not break.

C. Set stock plumb and in center of planting pit.

1. Use planting soil as indicated on plan for backfill.
2. Balled and Burlapped: After placing some backfill around root ball to stabilize plant, carefully cut and remove burlap, rope, and wire baskets from tops of root balls and from sides, but do not remove from under root balls. Remove pallets, if any, before setting. Do not use planting stock if root ball is cracked or broken before or during planting operation.
3. Container-Grown: Carefully remove root ball from container without damaging root ball or plant.
4. Backfill around root ball in layers, tamping to settle soil and eliminate voids and air pockets. When planting pit is approximately one-half filled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed.
5. Place planting tablets in each planting pit when pit is approximately one-half filled; in amounts recommended in soil reports from soil-testing laboratory. Place tablets beside the root ball about 1 inch (25 mm) from root tips; do not place tablets in bottom of the hole.
6. Continue backfilling process. Water again after placing and tamping final layer of soil.

D. When planting on slopes, set the plant so the root flare on the uphill side is flush with the surrounding soil on the slope; the edge of the root ball on the downhill side will be above the surrounding soil. Apply enough soil to cover the downhill side of the root ball.

3.4 TREE PRUNING

A. Remove only dead, dying, or broken branches. Do not prune for shape.

B. Prune, thin, and shape trees, shrubs, and vines according to standard professional horticultural and arboricultural practices. Unless otherwise indicated by Landscape Architect, do not cut tree leaders; remove only injured, dying, or dead branches from trees and shrubs; and prune to retain natural character.

3.5 GROUND COVER PLANTING

A. Set out and space ground cover and plants as indicated on plans in even rows with triangular spacing.

B. Use planting soil as shown on plan for backfill.

C. Dig holes large enough to allow spreading of roots.

D. Work soil around roots to eliminate air pockets and leave a slight saucer indentation around plants to hold water.

E. Water thoroughly after planting, taking care not to cover plant crowns with wet soil.

F. Protect plants from hot sun and wind; remove protection if plants show evidence of recovery from transplanting shock.

3.6 PLANTING AREA MULCHING

A. Install weed-control barriers before mulching according to manufacturer's written instructions. Completely cover area to be mulched, overlapping edges a minimum of 6 inches (150 mm)] [12 inches (300 mm) and secure seams with galvanized pins.

B. Mulch backfilled surfaces of planting areas and other areas indicated.

1. Shredded hardwood mulch in Planting Areas: Apply 3-inch (75-mm) average thickness of mulch extending 12 inches (300 mm) beyond edge of individual planting pit or trench and over whole surface of planting area, and finish level with adjacent finish grades.

3.7 PLANT MAINTENANCE

A. Maintain plantings by pruning, cultivating, watering, weeding, fertilizing, mulching, restoring planting saucers, resetting to proper grades or vertical position, and performing other operations as required to establish healthy, viable plantings. Spray or treat as required to keep trees and shrubs free of insects and disease.

B. Fill in as necessary soil subsidence that may occur because of settling or other processes. Replace mulch materials damaged or lost in areas of subsidence.

C. Apply treatments as required to keep plant materials, planted areas, and soils free of pests and pathogens or disease. Use practices to minimize the use of pesticides and reduce hazards.

D. Apply pesticides and other chemical products and biological control agents in accordance with authorities having jurisdiction and manufacturer's written recommendations. Coordinate applications with Owner's operations and others in proximity to the Work. Notify Owner before each application is performed.

E. Protect plants from damage due to landscape operations and operations of other contractors and trades. Maintain protection during installation and maintenance periods. Treat, repair, or replace damaged plantings.

END OF SECTION 32 93 00

SECTION 32 97 00 – BIORETENTION FACILITY

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Micro Bioretention Facility.

1.2 DESCRIPTION

A. Bioretention Facilities are small landscape basins intended to provide water quality management by filtering storm water runoff before release into storm drain systems and waterways.

PART 2 - PRODUCTS

2.1 MATERIALS

A. # 57 Stone Aggregate shall conform to ASTM C 33 No. 57.

B. # 8 Stone Aggregate shall conform to ASTM C 33 No. 8.

C. Mulch: 2x Shredded Hardwood Bark. Shredded hardwood bark shall be consist of the bark from hardwood trees which has been milled and screened to a maximum for inches (4'') particle size and provide a uniform texture free from sawdust, toxic substance and foreign material.

D. Plant Materials shall conform to section 329200 Turfgrass Sodding and 329300 Plants

E. Geotextile: Class PE, Type III, nonwoven, shall conform to the Geotextile Acceptance and Quality Assurance Procedure, Maryland Standard Method of Tests (MSMT) 732.

F. Pipe: six inch (6") Polyvinyl Chloride Profile Wall Pipe (PPWP) and Fittings, perforated and nonperforate. Pipe and fittings shall conform to ASTM F949-10 or AASHTO M-304.

G. Planting Soil:

1. The planting soil shall be a friable soil uniform in color and texture and not supplied from the project but must be furnished. The planting soil shall be free from any parts of Johnson grass, Canadian Thistle, or Phragmites. The USDA textural classification of the planting soil shall be loamy sand or sandy loam. The planting soil shall meet the following criteria:

ITEM	CRITERIA	TEST METHOD
Sand (2.0-0.050 mm)	50-85%	T88
Silt (0.050-0.002 mm)	0-50%	T88
Clay (less than 0.002 mm)	5-10%	T88
Organic Matter	1.5-10%	T194

The textural analysis for the planting soil shall be as follows:

SIEVE SIZE	MINIMUM PERCENT
2 inch	100
No.4	90
No. 10	80

2. At least forty-five (45) days prior to the start of construction of Bioretention Facilities, the Contractor shall submit the source of the planting soil to the owner for approval. No time extensions will be granted should the proposed planting soil fail to meet the minimum requirements stated above. Once a stockpile of the planting soil has been sampled, no material shall be added to the stockpile.

3. Planting soil that fails to meet the minimum requirements shall be replaced at no additional cost to the Owner.

H. Bioretention Soil Mixture (BSM). The Bioretention Soil Mixture (BSM) is a mixture of planting soil, mulch and sand consisting of the following:

ITEM	COMPOSITION BY VOLUME	REFERENCE
Planting Soil	30%	See above.
Shredded 2x Hardwood Mulch	20%	See above.
Sand	50%	ASTM C33 Fine Aggregate

1. The BSM shall be a homogeneous mix, free of stones, stumps, roots or other similar objects larger than two inches (2") excluding mulch. No other materials or substances shall be mixed or dumped within the bioretention area that may be harmful to plant growth or prove a hindrance to the planting or maintenance operations. The BSM shall be free of Bermuda grass, Quackgrass, Johnson grass, Mugwort, Nutsedge, Poison Ivy, Canadian Thistle, Teathumb, Phragmites or other noxious weeds as specified in COMAR 15.08.01.05. The BSM shall meet the following criteria:

ITEM	CRITERIA	TEST METHOD
Corrected pH	5.5-7.5	D4972
Magnesium	Minimum 35 ppm	*
Phosphorus (Phosphate-P20 5)	Minimum 75 ppm	*
Potassium (K2O	Minimum 85 ppm	*
Soluble Salts	Not to exceed 500 ppm	*

* University of Maryland, Cooperative Extension Service, Department of Agronomy Test Method.

2. Should the pH fall outside of the acceptable range, it may be modified with limestone (to raise) or iron sulfate (to lower). The limestone or iron sulfate must be mixed uniformly into the BSM prior to use in bioretention facilities.

3. Should the BSM not meet the minimum requirement for magnesium, it may be modified with magnesium sulfate (Epsom salt). Likewise, should the BSM not meet the minimum requirement for potassium, it may be modified with potash. Magnesium sulfate (Epsom salt) and potash must be mixed uniformly into the BSM prior to use in Bioretention Facilities.

4. BSM that fails to meet the minimum requirements shall be replaced at no additional cost to the Owner. Mixing of the corrective additives to the BSM is incidental and shall be at no additional cost to the Owner.

5. Mixing of the BSM to a homogeneous consistency shall be done to the satisfaction of the Engineer. Rototilling any type of amendment to the BSM is insufficient and destroys the unique matrix of the soil and is not be an acceptable mixing procedure.

PART 3 - EXECUTION

3.1 GENERAL

A. Bioretention Facilities shall not be constructed until all contributing drainage areas are stabilized as shown on the Contract Plans and to the satisfaction of the Engineer. Bioretention Facilities shall not be used as sediment control facilities. No heavy equipment shall operate within the perimeter of a Bioretention Facility during excavation, pipe system placement, backfilling, planting or rnulchlnq of the facility.

B. Excavation. The Bioretention Facility shall be excavated to the dimensions, side slopes and elevations shown on the Contract Plans. The method of excavation shall minimize the compaction of the bottom of the Bioretention Facility. Excavators and backhoes, operating on the ground adjacent to the Bioretention Facility shall be used to excavate the facility. No heavy equipment shall be allowed on the bottom of the Bioretention Facility. However, if the configuration of the facility requires that equipment operate on the bottom of the facility during excavation, wide track or marsh track equipment or light equipment with turf tires, shall be used. The use of equipment with narrow tracks or narrow tires, rubber tires with large lugs, or high pressure tires is prohibited.

C. Excavated materials shall be removed from the Bioretention Facility site. Excavated materials shall be used or disposed of in conformance with Division 01.

D. Prior to placing the pipe and the BSM, the bottom of the excavation shall be rototilled to a minimum depth of six inches (6") to alleviate any compaction of the facility bottom. Any substitute method for rototilling must be approved by the Engineer prior to use. Any ponded water shall be removed from the bottom of the facility and the soil shall be friable before rototilling.

3. 2 GEOTEXTILE

A. Following rototilling of the facility bottom, geotextile shall be placed on all sides of the facility as shown on the Contract Plans. Geotextile shall not be placed on the bottom of the facility. Geotextile shall be placed tightly against the facility walls to eliminate voids beneath.

B. Geotextile; wrinkles and folds in the geotextile shall be avoided. A minimum six inches (6") overlap at the geotextile joint ends or breaks shall be maintained. Geotextile joints

and overlaps shall be pinned to securely hold the geotextile in place until placement of the BSM.

C. Damaged geotextile shall be replaced or repaired as directed by the Engineer at no additional cost to the City.

3. 3 PERFORATED PIPE SYSTEM

A. The perforated pipe system using four inch (6") Polyvinyl Chloride Profile Wall Pipe (PPWP) shall be placed on bed of NO.57 aggregate (minimum bed thickness of six inches) that cover the entire bottom. Pipe shall be covered with five inches (5") of No. 57 aggregate and topped with an additional four inch (4") minimum layer of No. 8 aggregate. All aggregate shall be placed according to dimensions shown on the Contract Plans. Pipe outlets shall be outlet into drainage structures.

B. The ends of pipes not terminating in a cleanout, vent or drainage structure shall be capped.

C. All aggregate shall be clean and free of all soil and fines. Care shall be taken to prevent soil and fines from intermixing with the aggregate. All contaminated aggregate shall be removed and replaced with uncontaminated aggregate at no additional cost to the Owner.

3. 4 CLEANOUTS

A. Cleanouts of six inch (6") nonperforated PPWP shall be placed vertically in the bioretention facility as shown on the Contract Plans. The cleanouts shall be connected to the perforated pipe system with the appropriate manufactured connections as shown on the Contract Plans. The cleanouts shall extend six inches (6") above the top elevation of the bioretention facility mulch and shall be capped with a screw cap.

3. 5 OBSERVATION WELLS

A. Observation wells of six inch (6") perforated PPWP (color: white) shall be placed vertically in the bioretention facility as shown on the Contract Plans. The wells shall extend six inches (6") above the top elevation of the bioretention facility mulch and shall be capped with a screw cap. The well shall be supplied with an appropriate geotextile sock as recommended by the manufacturer.

3. 6 BIORETENTION SOIL MIXTURE

A. The Bioretention Soil Mixture (BSM) shall be placed and graded by using excavation hoes operating on the ground adjacent to the Bioretention Facility. No heavy equipment shall be used within the perimeter of the Bioretention Facility before, during or after the placement of the BSM. However, if the configuration of the facility is exceedingly large, wide track or marsh track, equipment or light equipment with turf type tires operating within the perimeter of the facility may be used to place and grade the BSM.

B. The BSM shall be placed in horizontal layers not to exceed 12 inches (12") for the entire area of the Bioretention Facility. The BSM shall be compacted by saturating the entire area of the Bioretention Facility after each lift of BSM is placed until water flows

from the perforated pipe system. Water for saturation shall be applied by spraying or sprinkling. Saturation of each lift shall be performed in the presence of the Engineer. An appropriate sediment control device shall be used to treat any sediment laden water discharged from the perforated pipe system. If the BSM becomes contaminated during the construction of the facility, the contaminated material shall be removed and replaced with uncontaminated material at no additional cost to the City. Final grading of the BSM shall be performed after a twenty-four (24) hour settling period. Final elevations shall be within two inches (2") of elevations shown on the Contract Plans.

3. 7 PLANT INSTALLATION

Refer to Section 329200 (Turfgrass Sodding) and 329300 (Plants).

3. 8 MULCHING

A. Once the plants are in place, the entire Bioretention Facility shall be mulched to a uniform thickness of three inches (3"). Well aged (minimum age of six months) shredded hardwood bark mulch is the only acceptable mulch. If plants cannot be installed into the facility within forty-eight (48) hours of final facility grading, the entire facility shall be temporarily stabilized with mulch at a uniform thickness of one inch (1").

END OF SECTION 32 97 00

SECTION 33 10 00 – WATER UTILITIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. City of Baltimore: Department of Public Works – *Specifications For Materials, Highways, Bridges, Utilities, and Incidental Structures* with all addenda thereto at the time bids are received (DPW Standard Specifications.) Subsections of DPW Standard Specifications describing "Measurement and Payment" shall not apply to this contract.

C. City of Baltimore: Department of Transportation – *Book of Standards* with all addenda thereto at the time bids are received (DOT Standards.) Subsections of DOT Standards describing "Measurement and Payment" shall not apply to this contract.

1.2 SUMMARY

A. Section specifies materials and work required to construct water services to new buildings.

B. Related Requirements:

1. Division 01 – Field Engineering.
2. Division 21 – Fire Suppression.
3. Division 22 – Plumbing.
4. Division 23 – Heating, Ventilation, and Air Conditioning.
5. Section 31 11 00 – Clearing and Grubbing.
6. Section 31 20 00 – Earth Moving.
7. Section 32 05 23 – Cement and Concrete for Exterior Improvements.
8. Section 31 25 00 – Erosion and Sediment Control

C. STANDARDS

1. American Water Works Association (AWWA).
2. City of Baltimore Department of Public Works (DPW).

1.3 SUBMITTALS

A. Construction Surveys

1. Construction Cut Sheets

a. Submit cut sheets to the Agency Construction Manager for review and approval prior to system construction.

B. Products

1. Submit manufacturer's specifications and installation instructions for the following:

    a. Pipe.
    b. Pipe Joint materials.
    c. Fittings.
    d. Valves.
    e. Accessories.
    f. Concrete buttress.

2. Submit certificate, signed by Manufacturer and Contractor, stating the following comply with this specification:

    a. Pipe.
    b. Pipe Joint material.
    c. Permissible Pipe joint deflection.
    d. Fittings.
    e. Valves.
    f. Accessories.

3. Submit shop drawings or catalog cuts of the following:

    a. Pipe.
    b. Fittings.
    c. Valves.
    d. Accessories.
    e. Concrete Buttress.

C. Test Reports

1. Submit Leakage Test reports, to include the following:

    a. Test gauge manufacturer, model number, and serial number.
    b. Test gauge chart for each test.
    c. Test gauge elevation for each test.
    d. Water meter manufacturer, model number, and serial number.
    e. Water meter readings before and after each test.
    f. Each test date.
    g. Test Section description (e.g. profile station).
    h. Pipe/Fitting joints in each test Section.
    i. Pipe diameter(s) and length of each diameter, for each test Section.
    j. Leakage rate formula computations for each test.

1.4 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Delivery

1. Schedule delivery operations to avoid unnecessary re-handling of materials.

B. Storage

1. Store products in accordance with Manufacturer's recommendations.
2. Store joint materials and lubricants in cool and dry location, free of oil, grease, excessive heat or direct sun rays.

C. Handling

1. Comply with manufacturer's recommendations.
2. Handle all pipes, valves and fittings with care to prevent damage the unit and its lining and coating etc.

1.5 QUALITY ASSURANCE

A. Provide products by one manufacturer for products of same material, classification or type.

1.6 PROJECT CONDITIONS

A. See Article 1.6, Project Conditions, in Section 31 20 00 – Earth Moving.

B. See DPW Standard Specifications Section 33 11 13 Part 3.3 K and as allowed by City of Baltimore regarding connections to existing systems and any disruption of service.

1.7 CONSTRUCTION SURVEYS

A. See Division 01– General Requirements.

B. Provide combined horizontal and vertical alignment stakes for system construction at twenty-five foot (25 ft) intervals, maximum, and at all appurtenances (e.g., fittings, valves, etc.).

C. Prepare construction cut sheets.

1.8 RECORD SURVEYS

A. See Division 01 – General Requirements.

PART 2 - PRODUCTS

2.1 GENERAL

A. Comply with City of Baltimore requirements for pipes, structures, and appurtenances outside of the building.

2.2 DUCTILE IRON PIPE AND FITTINGS

A. Pipe:

1. Type: Ductile Iron AWWA C 151.
2. Size: As indicated on the Contract Drawings.
3. Thickness Class: 54.
4. Interior Lining: AWWA C 104 Cement Mortar, double thickness.
5. Exterior Coating: Bituminous.

6. Laying Length: Standard Manufacture.

B. Pipe Joints:

1. Push on or Mechanical Joints: AWWA C 111.
2. Restrained Joint Manufacturers
   a. American Cast Iron Pipe company.
   b. U.S. Pipe.
   c. Griffin Pipe Products Co.
   d. EBAA Iron Inc.

3. Pipe Clamps and Tie Rods: NSI/NFPA 24.

C. Pipe Fittings:

1. Ductile Iron:

   a. Type: Ductile Iron AWWA C 110 or AWWA C 153.
   b. Size: Pipe size or as indicated on the Contract Drawings.
   c. Pressure Rating: 250 psi.
   d. Interior Lining: AWWA C 104 cement mortar, double thickness.
   e. Exterior Coating: Bituminous.
   f. Buried Fitting Ends: Mechanical joints.

2.3 VALVES

A. Gate Valves, up to 3 inches: Brass or Bronze body, non-rising stem, inside screw, single wedge or disc, compression ends, with control rod, extension body and valve key.

B. Gate Valves, 3 inches and over: ANSI/AWWA C509, Iron Body, bronze trim, non-rising stem with square nut, single wedge, resilient seat, flanged mechanical joint ends, as required, control rod and valve box.

C. Swing Check Valves, From 2 inches to 24 inches: AWWA C508, iron body, bronze trim, 45 degree swing disc, renewable disc and seat, flanged ends.

D. Valve Boxes: Provide cast-iron valve boxes, with boltable cover drilled and tapped for security fasteners (minimum 2 required per cover).

1. Cast-Iron Boxes: Extension type with slide type adjustment, flared base, 3/16 inch minimum thickness of metal.
2. Cast the word “WATER” in cover.

2.4 BEDDING MATERIALS

A. Bedding: As specified in DPW Standard Specifications or as noted on the Contract Drawings.

2.5 THRUST RESTRAINT

A. Restrained Joint manufacturers

1. American Cast Iron Pipe Company.
2. U. S. Pipe.
3. Griffin Pipe Products Co.
4. EBAA Iron Inc.
5. And as allowed by DPW Standard Specifications.

B. Pipe Clamps and Tie Rods: ANSI/NFPA 24.

C. Thrust Blocks/Concrete Buttress: Concrete: Mix 6 or high early strength Portland Cement Concrete, see Article 2.4 in Section 32 05 23 – Cement and Concrete for Exterior Improvements. Thrust Block/Concrete Buttress dimensions as indicated on Contract Drawings, DPW Standard Details and/or Approved Shop Drawings.

2.6 DISINFECTION PRODUCTS

A. Continuous Feed Disinfection Method:

1. Calcium Hypochlorite, Granular Form: AWWA B 300, or Liquid Chlorine AWWA B 301, or Sodium Chlorite AWWA B 303

PART 3 - EXECUTION

3.1 GENERAL

A. Underground water mains, valves and fire hydrants shall be installed, tested and flushed in accordance with NFPA 24.

B. Comply with Baltimore City requirements for all pipe outside the building.

3.2 EXISTING SERVICE PROTECTION AND OPERATION

A. While construction takes place, service will be maintained in all lines not indicated as being abandoned and/or demolished. Controls (e.g. valves, etc.) on existing water distribution system will be operated only by authorized Division of Corrections Personnel and/or City of Baltimore Personal. Requests for water-line shut off and its duration shall be made to the Agency Construction Manager 48 hours (minimum) in advance and as allowed by City of Baltimore.

3.3 CLEARING

A. See Section 31 11 00 – Clearing and Grubbing.

3.4 EXCAVATION, OVER-EXCAVATION, UNSUITABLE MATERIAL AND DE-WATERING

A. See Section 31 20 00 – Earth Moving.

3.5 BEDDING

A. Excavate trench for system construction in accordance with Section 31 20 00 – Earth Moving and Section 32 05 23 – Erosion and Sediment Control for all work in this Section. Hand trim excavation for accurate placement of pipe to elevation indicated.

B. Remove large stones or other hard matter that could damage pipe or impede consistent backfilling or compaction.

C. Place bedding material at trench bottom, level fill materials in one continuous layer as indicated, compact to 95%.

D. Backfill around sides and to top of pipe with fill, tamped in place and compacted to 95%.

E. Maintain optimum moisture content of bedding material to attain required compaction density.

F. Comply with City of Baltimore requirements for all pipe outside the building.

3.6 EXISTING SYSTEM CONNECTIONS

A. The Contractor shall verify that existing system control valves are set in closed position and affected pipe sections are suitably drained and not pressurized.

B. Excavate and expose existing pipe at connection locations indicated on the Contract Drawings.

C. Clean exposed pipe surfaces, removing rust, scale and foreign matter.

D. Disinfect exposed pipe, and pipe and fittings to be installed with five percent (5%) disinfection solution.

E. Install pipe and fittings as required by the Contract Drawings and in accordance with DPW Standard Specifications and DPW Standard Details.

3.7 PIPE

A. General

1. Install in accordance with pipe Manufacturer's installation instructions and as specified on the Contract Drawings.
2. The items below shall be inspected prior to installation to ensure that no damage has occurred before placement in the trench. During installation, care shall be given to all components of the system to prevent any damage. Any components of the system found to be damaged shall be removed and replaced by the Contractor in a timely fashion to prevent any delays in the project schedule. All replaced components shall be furnished by the Contractor at no additional increase to the Contract Sum.

    a. Every pipe section.
    b. All Pipe joint materials.
    c. Every fitting
    d. Every Accessory.

3. Install pipe to horizontal and vertical alignment as indicated on Contract Drawings.
4. Pipe cradle or encasement shall be provided when the situation warrants and as per Contract Drawings, no other blocking shall be permitted.
5. Place fittings at changes in horizontal and vertical alignment as indicated on the Contract Drawings.
6. Temporary bulk heads shall be placed in all open ends of pipes and fittings, whenever pipe laying is not actively pursued. The bulk heads shall be designed to prevent rodents, dirt, debris or water entry. The bulkheads shall be furnished without an increase to the Contract Sum.
7. No pipe laying on frozen or probable-frost in trench bottom.
8. Pipe cutting at job site

    a. Field-cut pipe only where required to complete closures or install fittings.
    b. Cut pipe to smooth square ends with equipment designed for cutting pipe.

9. Mark locations of ends of pipe at building tie-in locations with blue painted stakes protruding 3 feet above finished grade, marked in black with the work ‘WATER’.

B. Ductile Iron Pipe shall be buried per the finished grade profile with four feet (4 ft) minimum cover required and/or per Contract Drawings for any related pipe.

1. Install in accordance with AWWA C 600.
2. Install with bell ends facing direction of laying operations.
3. Place identifying mark on pipe not provided with spigot depth mark.
4. Clean bell and spigot interior and exterior surfaces, removing oil, grit, excess coating and foreign matter.
5. Lubricate pipe ends and gasket in accordance with Manufacturer's instructions.
6. Assemble mechanical joints in accordance with AWWA C 111, Appendix A, "Notes on Installation Of Mechanical Joints."
7. Pipe joint deflection not to exceed limits specified in Table 1, AWWA C 600.

C. Concrete Buttress:

1. Construct Concrete Buttress at each of the following fittings:

    a. Bends (horizontal and vertical)
    b. Tees.
    c. Caps.

3.8 VALVES

A. Set valves on solid bearing

B. Center and plumb valve box over valve. Set box cover flush with finished grade.

C. Install tapping sleeves and valves in accordance with manufacturer’s recommendations.

3.9 SERVICE CONNECTIONS

A. A. Provide water service connection in accordance with utility company requirements, with backflow preventer and valves.

3.10 SYSTEM TESTING

A. General

1. Provide labor, materials and equipment (e.g., pumps, gauges, etc.) required to conduct tests specified below.
2. Do not conduct tests until concrete anchors cure for at least 7 calendar days. If high early strength concrete is used, anchor curing time may be reduced to 36 hours, at the Contractor's risk.
3. Test Observations shall be conducted by representative of the Contractor's Construction Inspection and Testing Firm and the State's Construction Inspecting and Testing Firm.

B. Hydrostatic Pressure Tests

1. All testing shall be directed and witnessed by a representative of Contractor's Construction Inspection and Testing Firm and the State's Construction Inspecting and Testing Firm.
2. Conduct hydrostatic pressure test after back-fill and compaction to 1 foot above top of pipe. When piping is to be insulated or concealed in a structure, test shall be conducted before the pipe is covered.
3. Test Procedure

    a. Slowly fill pipe-test section with water, from lower system elevation, and ensure release of water and entrapped air only at the highest point of the test-section.

        1) Provide equipment (e.g., tapping machines) and install system testing corporation stops at high system elevations not provided with permanent air release appurtenances (e.g., fire hydrants).
        2) Set corporation stops in open position, during filling operations, until steady flow of water is released.

    b. Slowly apply test pressure with manually operated or engine driven pump.
    c. Test Pressure: 150 psi (minimum).
    d. Test Duration: 1 hour (minimum).

4. Inspection

    a. Examine all system joints for leakage.

5. Corrective work

    a. Repair or replace defective products and system construction, prior to completion of back-fill operations, as directed by the Agency Construction Manager.

C. Hydrostatic Leakage Test

1. Conduct hydrostatic leakage test upon completion of back-fill operations.
2. Test Procedure

    a. As specified for hydrostatic pressure test, except as noted.
    b. Reset corporation stops in open position, during filling operations, until steady flow of water is released.

c. Install meter, registering U.S. gallons, in water supply and determine water quantity required to maintain test pressure during test duration.
d. Test Pressure: 150 psi (minimum).
e. Test Duration: 4 hours (minimum).

3. Leakage

a. Conduct a leakage test concurrently with the pressure test.
b. Maximum allowable leakage will be calculated by using following formula:

$$L = (S * D / P) / 133,200$$

Where:
L = maximum allowable leakage, gallons/hour.
S = length of pipe in test section, in feet.
D = nominal diameter of tested pipe, in inches.
P = average test pressure, pounds per square inch which will be computed by averaging the pressure at the low point and the pressure at the high point of the system being tested.

c. Submit leakage test report as specified.

D. Corrective Work

1. Repair or replace defective products and system construction, as directed by the Agency Construction Manager at no increase to the Contract Sum.
2. Retest corrected system as specified.
3. Provide additional corrective work and retesting until system is approved and accepted by the Agency Construction Manager, at no increase to the Contract Sum.
4. Provide corrective work and retesting at no increase to Contract Sum.

3.11 SYSTEM DISINFECTION

A. General

1. Provide labor, materials and equipment required to disinfect system.
2. Disinfect system in accordance with AWWA B301 and as specified in this Section.

B. Continuous Feed Disinfection Method

1. Preliminary Flushing Velocity – two and a half feet per second (2.5 fps).
2. Solution Concentration

a. The Contractor shall maintain the Available Chlorine equal to or greater than a concentration of fifty milligrams per liter (50 mg/l) during the twenty-four hour (24 hr) disinfection period.
b. Available Chlorine Test Interval – Twelve hours (12 hr) Maximum.

3. Final Flushing Velocity – two and one half feet per section (2.5 fps).
4. Flushing and Drainage Locations - Approved by the representative of the Contractor's Construction Inspection and Testing Firm.
5. Repeat flushing operations until residual chlorine concentration is less than one half part per million (0.5 ppm) or equal to water-source concentration levels.

a. Residual Chlorine Tests - Conducted upon completion of final flushing operations.

6. The disposal of chlorinated water from any pipe or structure shall be such that it will not cause damage to any vegetation, fish or animal life.

C. Chlorine Testing:

1. Provide labor, materials and equipment required to conduct available and residual chlorine tests.
2. Test Observations - By the representative of the Contractor's Construction Inspection and Testing Firm and the State's Construction Inspection and Testing Firm.

D. Bacteriologic Quality Testing

1. Water bacteriologic quality tests will be conducted upon completion of final flushing operations as required to comply with Local and State health requirements.
2. Repeat disinfection operations until satisfactory bacteriologic quality tests are obtained at no increase to the Contract Sum.

END OF SECTION 33 10 00

SECTION 33 31 00 – SANITARY SEWER UTILITIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. City of Baltimore: Department of Public Works – *Specifications For Materials, Highways, Bridges, Utilities, and Incidental Structures* with all addenda thereto at the time bids are received (DPW Standard Specifications.) Subsections of DPW Standard Specifications describing "Measurement and Payment" shall not apply to this contract.

C. City of Baltimore: Department of Transportation – *Book of Standards* with all addenda thereto at the time bids are received (DOT Standards.) Subsections of DOT Standards describing "Measurement and Payment" shall not apply to this contract.

1.2 SUMMARY

A. Section specifies materials and work required to construct gravity sewer systems.

B. Related Requirements:

1. Division 01 – Field Engineering.
2. Section 31 11 00 – Clearing and Grubbing.
3. Section 31 20 00 – Earthwork Moving.
4. Section 31 25 00 – Erosion and Sediment Control.
5. Section 32 05 01 – Miscellaneous Concrete.
6. Division 22 – Plumbing.
7. DPW Standard Specification: Sections 31 23 23 and 21 23 33 – Aggregate Materials

C. STANDARDS

1. American Society for Testing and Materials (ASTM).
2. City of Baltimore Department of Public Works (DPW).
3. American Society of Testing and Materials (ASTM).

1.3 SUBMITTALS

A. Provide submittals in compliance with the conditions of the Contract and Division 01 – General Requirements.

B. Construction Surveys

1. Submit construction cut sheets to the Agency Construction Manager for review and approval prior to system construction.

C. Products

1. Submit manufacturer's specifications and installation instructions for the following:

    a. Pipe
    b. Pipe Joints.
    c. Pipe Fittings.
    d. Cleanouts.
    e. Precast Concrete Manhole.
    f. Cleanout frames and covers.
    g. Manhole frame and covers.

2. Submit certificate, signed by Manufacturer and Contractor, stating that the following comply with this specification:

    a. Pipe.
    b. Pipe Joints.
    c. Pipe Fittings.
    d. Precast concrete Manhole.
    e. Cleanout frames and covers
    f. Manhole frame and covers.

3. Submit shop drawings and catalogue cuts of the following, indicating materials, sizes and clearances

    a. Cleanout frames and covers with security bolt details.
    b. Manhole frame and covers with security bolt details.
    c. Manhole steps.
    d. Method and materials for the connection of dissimilar pipe materials where they connect.
    e. Precast Concrete Manhole.
    f. Leveling Rings brick and mortar or precast concrete.

1.4 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Provide submittals in compliance with the conditions of the Contract and Division 01 – General Requirements.

B. Delivery

1. Schedule delivery operations to avoid unnecessary re-handling of materials.

C. Storage

1. Store products in accordance with Manufacturer's recommendations.
2. Store joint materials and lubricants in cool and dry location, free of oil, grease, excessive heat or in direct sun rays.

D. Handling

1. Comply with Manufacturer's recommendations.

1.5 QUALITY CONTROL

A. Provide products by only one manufacturer for products of same material, classification or type.

1.6 PROJECT CONDITIONS

A. See Article 1.6, Project Conditions, in Section 31 20 00 – Earth Moving.

B. See DPW Standard Specification Section 33 31 00 and as indicated on the Contract Drawings for maintaining existing flows and services.

1.7 CONSTRUCTION SURVEYS

A. See Division 01 – General Requirements.

B. Provide combined horizontal and vertical alignment stakes for system construction at twenty-five foot (25 ft) intervals maximum and at any cleanout.

C. Prepare construction cut sheets.

1.8 RECORD SURVEYS

A. See Division 01 – General Requirements.

PART 2 - PRODUCTS

2.1 DUCTILE IRON PIPE

A. See Part 2, Products, in Section 33 10 00 – Water Utilities, Products shall be the same except Pipe shall be a minimum of Class 52 and the working pressure shall not apply.

2.2 PVC PIPE

A. See DPW Standard Specifications Section 33 31 00 and as indicated on the Contract Drawings.

2.3 PRECAST CONCRETE MANHOLES

A. See Part 2, Products, in Section 33 40 00 – Storm Drain Utilities.

B. See DPW Standard Specifications Section 33 39 00 and as indicated on the Contact Drawings.

2.4 STRUCTURE CASTINGS

A. Castings Manufactured by Neenah Foundry Company, Neenah, Wisconsin, or approved equal.

1. Cleanout frames and covers (lids):

a. Catalog Number - R-6461-BH, with anchor bolt holes.
b. Lid Bolts - System security bolt pattern.
c. Provide cast-iron frames and covers as indicated and as required for the structure.
d. Provide waterproof, bolt-able covers. Drill and tap frame and cover for security fasteners (minimum four required per frame and cover).
e. Provide removable covers to seat in frames without rocking.
f. Identify covers with cast marking “SANITARY CLEANOUT”. Cast the name and location of manufacturer on the frame and cover.
g. Provide castings free from blowholes, splits, cracks, blisters, mold pull, and other imperfections affecting strength and serviceability.
h. Must be lockable as accepted by the Agency Construction Manager.

2. Manhole frames and covers (lids):

a. Catalog Number - R-1916 F, with anchor bolt holes.
b. Lid Bolts - System security bolt pattern.
c. Provide cast-iron frames and covers as indicated and as required for the structure.
d. Provide waterproof, bolt-able covers. Drill and tap frame and cover for security fasteners (minimum four required per frame and cover).
e. Provide removable covers to seat in frames without rocking.
f. Identify covers with cast marking “SANITARY SEWER”. Cast the name and location of manufacturer on the frame and cover.
g. Provide castings free from blowholes, splits, cracks, blisters, mold pull, and other imperfections affecting strength and serviceability.
h. Must be lockable as accepted by the Agency Construction Manager.

B. Substitutions – See provisions of Division 01.

2.5 STRUCTURE APPURTENANCES

A. See Section 33 40 00- Storm Drain Utilities, Part 2: Products

B. See DPW Standard Specification Section 33 39 00 and as indicated on the Contract Drawings.

2.6 SYSTEM SECURITY BOLTS

A. Security bolt manufactured by Safety Socket Screw Corporation (Blue Devil Tamper Proof), or approved equal.

1. Type – Stainless Steel, hexagonal socket head with interior pin.
2. Size – As required or specified.

2.7 PIPE ENCASEMENT

A. Concrete Mix No. 2, see Section 32 05 01 – Cement and Concrete for Exterior Improvements or as noted on the Contract Drawings or as required by the City of Baltimore.

2.8 FOUNDATION MATERIALS

A. Porous Fill

1. Course Aggregate – ASTM C 33.
2. Size Number 57 Aggregates – See DPW Standard Specification 31 23 23.53
3. Blast furnace slag is prohibited.

2.9 MISCELLANEOUS PRODUCTS

A. Structure Invert Flow Channels

1. Sewer Brick - ASTM C 32, Grade SS.
2. Cement Mortar - ASTM C 270, Type S.
3. As allowed by DPW Standard Specifications.

B. Structure Coating Material

1. Coating material manufactured by Koppers Company, Pittsburgh, Pennsylvania.

   a. Type - "Bitumastic Super Service Black."

2. Substitutions - under provisions of Division 01 – General Requirements.

PART 3 - EXECUTION

3.1 GRAVITY SEWERS: PROTECTION AND RESTORATION

A. See Section 31 20 00 – Earth Moving.

B. General

1. Provide support systems (e.g. sheeting, shoring, etc.) as required, at no increase to Contract Sum.

   a. Trench Shields or Boxes - Exercise care during movement to prevent utility displacement.
   b. Remove timber support systems as backfill proceeds.

C. Seal pipes when construction is not in progress with temporary watertight appurtenances (e.g. stoppers, caps, plugs) to prevent entrance of foreign materials, ground water, earth and debris; at no increase to the Contract Sum.

3.2 CLEARING

A. See Section 31 11 00 – Clearing and Grubbing.

3.3 DEWATERING, EXCAVATION, OVER-EXCAVATION AND UNSUITABLE MATERIAL

A. See Section 31 11 00 – Clearing and Grubbing.

B. Remove large stones or other hard matter which could damage pipe or impede consistent backfilling or compaction

3.4 BEDDING

A. Excavate installation trench for system in accordance with Section 31 20 00 – Earthwork, for work of this Section. Hand trim excavation for accurate placement of pipe to elevation indicated.

B. Place bedding material at trench bottom, level fill materials in one continuous layer as indicated, compact to 95%.

C. Backfill around sides and to top of pipe with fill, tamped in place and compacted to 95%.

D. Maintain optimum moisture content of bedding material to attain required compaction density.

E. Comply with DPW Standard Specifications and DPW Standard Details within the City of Baltimore Right-of-Way and public easements.

3.5 STRUCTURES

A. Precast Concrete Structures

1. Precast Concrete Structure Base

    a. Place granular foundation material on excavation subgrade and compact to the bottom elevation of the precast concrete structure base to meet the pipe inverts as shown on the Contract Drawings.
    b. Install precast concrete structure base on foundation material, level to 1/8 inch in five feet.

2. Clean and lubricate precast concrete structure joints, immediately prior to installation, in accordance with Manufacturer's recommendations.
3. Install precast sections on structure base, plumb to 1/8 inch in five feet.
4. Position each precast concrete section on previously installed section and push joints tightly together.
5. Position top section on structure as indicated on the Contract Drawings or required by job site conditions.
6. Install frame and grate to finished grade, with sewer brick and cement mortar specified.
7. Pipe Connections

a. Seal joints between pipes and structures with brick and cement mortar specified.
b. Neatly cut pipes flush with interior structure walls.

8. Invert Flow Channels

a. Construct invert flow channels smooth and semi-circular in shape.
b. Shape channels with horizontal circular curve radii tangential to inflow pipe alignment(s) and outflow pipe alignment.
c. Neatly form channels in structure base with sewer brick and cement mortar specified.

B. SYSTEM SECURITY BOLTS

1. New Precast Concrete Structures that are constructed inside of the permanent security perimeter shall receive system security bolts.

3.6 PIPE

A. See Article 3.7, Pipe, in Section 33 10 00 – Water Utilities.

B. Comply with DPW Standard Specifications and DPW Standard Details within the City of Baltimore Right-of-Way or public easement.

3.7 BACKFILL

A. See Section 31 20 00 – Earth Moving.

B. Comply with DPW Standard Specifications and DPW Standard Details within the City of Baltimore Right-of-Way or public easement.

3.8 SYSTEM TESTING

A. General

1. Provide labor, materials and equipment (e.g. pumps, gauges, etc.) required to test system as specified.
2. Test system upon completion of backfill operations and after discontinuance of dewatering operations, except at pipe ends.
3. Test Observations - By representative of Contractor's Construction Inspection and Testing Firm and the State's Construction Inspection and Testing Firm.
4. Comply with City of Baltimore and DPW Standard Specification testing requirements.

B. Pipe Alignment Tests

1. Test Locations:

a. Each structure-to-end-of-pipe (e.g. at building connection points) section.

2. Test Equipment - Electric lights approved by representative of Contractor's Construction Inspection and Testing Firm and the State's Construction Inspection and Testing Firm.
3. Test Procedure - Illuminate pipe interior, at each structure, as directed by representative of the Contractor's Construction Inspection and Testing Firm and the State's Construction Inspection and Testing Firm.
4. Test Result Required - Pipe alignment to produce full circle of light when viewed from adjoining structure or end of pipe.

C. Low Pressure Air Test

1. Test Locations:

    a. Each structure-to-end-of-pipe (e.g. at building connection points) section.

2. Contractor may backfill pipe ends prior to test.
3. Pretest Inspection

    a. Do not conduct low pressure air tests until completion of pipe alignment test and approval by the representative of the Contractor's Construction Inspection and Testing Firm and the State's Construction Inspection and Testing Firm

4. Test Equipment - Cherne Air-Loc Equipment Manufactured by Cherne Industrial, Inc., Edina, Minnesota.

    a. Substitutions – Under provisions of Division 01 – General Requirements.
    b. Pneumatic Plugs:

        1) Sealing Length – Equal to or greater than pipe diameter being tested.
        2) Design – To reset or test pressured without external bracing.

5. Testing Air – To pass through single control panel.
6. Test Hoses – Three.

    a. One, from control panel to pneumatic plugs.
    b. One, from control panel to sealed pipe section, for introducing test air.
    c. One, from control panel to sealed pipe section, to continuously monitor air pressure in sealed pipe section.

7. Pneumatic Plug Test

    a. Test pneumatic plugs prior to use in low pressure air test as follows:

        1) Set one laying length of pipe on ground and seal both ends with pneumatic plugs.
        2) Inflate pneumatic plugs to 25.0 PSI gauge.
        3) Pressurize sealed pipe to 5.0 PSI gauge.

    b. Test Result Required - Pneumatic plugs to hold against pressure, without bracing or movement.

8. Low Pressure Air Test Procedure

    a. Clean pipe removing debris, silt and foreign matter.

b. Flush or spray pipe interior with water.
c. nstall pneumatic plugs in pipe at each structure, and inflate to 25.0 PSI gauge.
d. Slowly pressurize pipe section to 4.0 PSI gauge and allow pressurized air temperature to stabilize two minutes.
e. Disconnect air supply hose, from control panel, at end of stabilization period.
f. Time interval for pressure to decrease from 3.5 to 2.5 PSI gauge will be observed and recorded by representative of the Contractor's Construction Inspection and Testing Firm and the State's Construction Inspection and Testing Firm.

9. Acceptable Time Interval

a. Acceptable time interval, for specified pressure decrease: two minutes (2 min) (120 seconds) minimum.

D. Corrective Work

1. Repair or replace defective products and system construction, which fail tests, as directed by the Agency Construction Manager.
2. Retest corrected systems as specified, above.
3. Provide additional corrective work and retesting until system is approved and accepted by the Agency Construction Manager.
4. Provide corrective work and retesting at no increase to Contract Sum.

END OF SECTION 33 31 00

SECTION 33 40 00 – STORM DRAIN UTILITIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. City of Baltimore: Department of Public Works – *Specifications For Materials, Highways, Bridges, Utilities, and Incidental Structures* with all addenda thereto at the time bids are received (DPW Standard Specifications.) Subsections of DPW Standard Specifications describing "Measurement and Payment" shall not apply to this contract.

C. City of Baltimore: Department of Transportation – *Book of Standards* with all addenda thereto at the time bids are received (DOT Standards.) Subsections of DOT Standards describing "Measurement and Payment" shall not apply to this contract.

D. American Society of Testing and Materials International (ASTM) standards and test methods.

1.2 SUMMARY

A. Section specifies materials and work required to construct storm drain systems.

B. Related Requirements:

1. Division 01 – Field Engineering.
2. Division 22 – Plumbing.
3. Section 31 11 00 – Clearing and Grubbing.
4. Section 31 20 00 – Earth Moving.
5. Section 31 25 00 – Erosion and Sediment Control.
6. Section 32 05 23 – Cement and Concrete for Exterior Improvements.
7. DPW Standard Specifications: Sections 31 23 23 and 21 23 33 – Aggregate Materials.

C. STANDARDS

1. American Concrete Pipe Association (ACPA).
2. American Water Works Associations (AWWA).
3. City of Baltimore Department of Public Works (DPW).
4. American Society of Testing and Materials (ASTM).

1.3 ACTION SUBMITTALS

A. Provide submittals in compliance with the conditions of the Contract and Division 01 – General Requirements.

B. Construction Surveys

1. Submit Construction cut sheets to the Agency Construction Manager for review and approval prior to system construction.

C. Products

1. Submit Manufacturer's specifications and installation instructions for the following:

   a. Pipe
   b. Pipe joints
   c. Manhole frame and covers.
   d. Inlet frame and grates.

2. Submit certificates, signed by Manufacturer and Contractor, stating the following comply with this specification:

   a. Pipe
   b. Pipe joint materials.
   c. Precast Concrete manhole/inlet sections, including top and bottom.
   d. Manhole frame and covers.
   e. Inlet frame and grates.

3. Submit shop drawings and catalogue cuts of the following, indicating materials, sizes and clearances.

   a. Inlet castings/trench drain covers with security bolt details.
   b. Precast concrete manhole/inlet sections, including top and bottom.
   c. Manhole/Inlet steps.
   d. Method and materials with supporting computations for strapping and supporting pipes to walls, ceilings, and other structures including horizontal and vertical runs of pipe.
   e. Method and materials for connecting dissimilar pipe materials where pipes of dissimilar materials connect.
   f. Method and materials for temporary support of other utilities intersecting/crossing storm drain system construction.
   g. Bypass pumping configuration including pump curves reflecting pump is sized accurately sized for pump around task.]
   h. Manhole frame and covers.
   i. Inlet frame and grates.

1.4 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Delivery

1. Schedule delivery operations to avoid unnecessary re-handling of materials.

B. Storage

1. Store products in accordance with Manufacturer's recommendations.
2. Store joint materials and lubricants in a cool and dry location, free of oil, grease, excessive heat or in direct sun rays.

C. Handling

1. Comply with Manufacturer's recommendations.

2. Handle concrete pipe with care to prevent damage to pipe joints.

1.5 QUALITY ASSURANCE

A. Provide products by only one manufacturer for products of same material, classification or type.

B. Each pipe section and/or structure shall be stamped with manufacturers' name and classification/type of material.

1.6 PROJECT CONDITIONS

A. See Article 1.6 Project Conditions, Section 31 20 00 – Earth Moving.

B. Existing Storm Drain Systems:

1. Provide, install, operate and maintain pumps and related equipment as required to divert stormwater (By-Pass Pumping) during storm drain system construction.

a. Extend pump discharge lines to existing drainage structures or stabilized ditch flowing to an established watercourse.
b. Ponding of stormwater, except in stormwater management facilities designed for it, is prohibited.

1.7 CONSTRUCTION SURVEYS

A. See Division 01 – General Requirements.

B. Provide combined horizontal and vertical alignment stakes for system construction at twenty-five foot (25 ft) intervals, maximum, and at all structure locations.

C. Prepare construction cut sheets.

1.8 RECORD SURVEYS

A. See Division 01 – General Requirements.

PART 2 - PRODUCTS

2.1 CONCRETE PIPE

A. Circular Pipe: ASTM C 76 reinforced concrete.

1. Internal Diameter: As indicated on the Contract Drawings.
2. Class: As indicated on the Contract Drawings or a minimum of Class IV or stronger.
3. Laying Length: Standard per manufacture.
4. Pipe Joints: Modified tongue and groove.

B. Joint Materials:

1. Rubber Gaskets: ASTM C443.
2. Joint Lubricant: Vegetable Oil Soap.

2.2 DUCTILE IRON PIPE

A. See Section 33 10 00 - Water Utilities, Part 2: Products

2.3 UNDERDRAINS

A. See DPW Standard Specification Section 33 41 00 Part 2.1 E.

B. As otherwise approved and allowed by City of Baltimore and the Agency Construction Manager.

2.4 PRECAST CONCRETE MANHOLES AND INLETS

A. General

1. Structural Design Loading – ASTM C 857.
2. Live Load Designation – H-20

B. Precast Structures

1. Precast Structures – Manholes and Inlets – ASTM C478.
2. Joints – ASTM C 443.
3. Base Sections

a. Cast with integral floor and with required pipe openings, as indicated on the Contract Drawings.
b. Inside diameter -.as indicated on the Contract Drawings.

4. Riser Sections

a. Inside diameter - as indicated on the Contract Drawings.

5. Top Sections

a. Eccentric Cone Type.
b. Opening diameter in the top section shall match the interior diameter of the respective casting for the structure.

6. Top Section Accessories

a. Cast with threaded inserts for casting and/or inlet frame anchor bolt installation. Insert locations to match frame anchor bolt hole pattern.

1) Threaded inserts, Type HF, as manufactured by Hohmann and Barnard, Inc., Alexandria, Virginia or approved equal.
2) Substitutions: under provisions of Division 01 – General Requirements.

C. Anchor Bolts - ANSI B18.6.2.

1. Type - Stainless Steel.
2. Threads - ANSI B1.1, Type NC.
3. Nominal Size - 3/4 inch.
4. Head Type - Hexagon.
5. Length - as required.

D. Anchor Bolt Washers - ANSI B27.2.

1. Type - Heavy Stainless Steel.
2. Size - Anchor bolt size specified.

E. Masonry

1. Sewer Brick - ASTM C 32, Grade SS.
2. Mortar - ASTM C 270, Type S.
3. As allowed by DPW Standard Specifications.

2.5 STRUCTURE CASTINGS

A. Manhole and Inlet frames, grates and covers.

1. As indicated in the Contract Drawings.
2. Must be lockable as accepted by the Agency Construction Manager for locations not within City of Baltimore Right-of-way.

B. Provide cast-iron frames and covers as indicated and as required for the structure.

C. Provide boltable covers. Drill and tap frame and cover for security fasteners (minimum four required per frame and cover.)

D. Provide removable covers to seat in frames without rocking.

E. Identify covers with cast marking “STORM DRAIN”. Cast mark the name and location of manufacturer on frame and cover.

F. Provide castings free from blowholes, splits, cracks, blisters, mold pull, and other imperfections affecting strength and serviceability.

G. Substitutions - under provision of Division 01 – General Requirements.

2.6 STRUCTURE APPURTENANCES

A. Steps

1. Steps manufactured by M.A. Industries, Inc., Peachtree City, Georgia or approved equal.

a. Type : PS2-PF
b. Substitutions - under provision of Division 01 – General Requirements.

2. Provide steps in accordance with OSHA regulations.
3. Vertical step spacing - 12 inches on center, measured from top of structure cover.

2.7 SYSTEM SECURITY BOLTS

A. Security bolt manufactured by Safety Socket Screw Corporation (Blue Devil Tamper Proof), or approved equal.

1. Type - Stainless Steel, hexagonal socket head with interior pin.
2. Size - As required or specified.

2.8 FOUNDATION MATERIALS

A. Porous Fill

1. Coarse Aggregate - ASTM C 33.
2. Size Number 57 Aggregates – See DPW Standard Specification 31 23 23.53.
3. Blast furnace slag is prohibited.

2.9 MISCELLANEOUS PRODUCTS

A. Structure Invert Flow Channels

1. Sewer Brick - ASTM C 32, Grade SS.
2. Cement Mortar - ASTM C 270, Type S.
3. As allowed by DPW Standard Specifications.

B. Structure Coating Material

1. Coating material manufactured by Koppers Company, Pittsburgh, Pennsylvania.

a. Type - "Bitumastic Super Service Black."

2. Substitutions - under provisions of Division 01 – General Requirements.

PART 3 - EXECUTION

3.1 PROTECTION AND RESTORATION

A. See Section 31 20 00 – Earth Moving.

B. General

1. Provide support systems (e.g. sheeting, shoring, etc.)as required, at no increase to Contract Sum.

a. Trench Shields or Boxes - Exercise care during movement to prevent utility displacement.

b. Remove timber support system as backfill proceeds.

2. Seal pipes when construction is not in progress with temporary watertight appurtenances (e.g. stoppers, caps, plugs) to prevent entrance by foreign materials, ground water, earth and debris; at no increase to the Contract Sum.

3.2 CLEARING

A. See Section 31 11 00 – Clearing and Grubbing.

3.3 DEWATERING, EXCAVATION, OVER-EXCAVATION AND UNSUITABLE MATERIAL

A. See Section 31 11 00 – Clearing and Grubbing.

B. Remove large stones or other hard matter which could damage pipe or impede consistent backfilling or compaction.

3.4 PIPE

A. General

1. Install in accordance with pipe Manufacturer's installation instructions and as Specified.
2. Inspect the following for defects:

a. Each pipe length/piece.
b. Pipe joint materials.

3. Immediately remove defective products from project site at no increase to the Contract Sum.
4. Install pipe to horizontal and vertical alignment indicated on the Contract Drawings.
5. Begin installation at lowest system elevation and proceed up-grade.
6. Field Pipe Cutting:

a. Field cut pipe only where required to complete structure-to-structure or structure-to-end of pipe sections.
b. Cut pipe to smooth square ends with equipment designed for cutting pipe.

7. Mark locations of pipe at building tie-in locations with painted stakes protruding three feet above finished grade, marked "Storm Drain”.

B. Concrete Pipe

1. Modified tongue and groove pipe
2. Install with pipe tongue end pointing in flow direction.

3.5 Rubber Gasket Joints

A. Clean and lubricate joints, immediately prior to joining pipe, in accordance with Manufacturer's instructions.

B. Position each laying length in previously installed pipe and push or pull joint tightly together with mechanical device designed for pipe joining. Do not use an excavator or a backhoe unless fitted with a properly designed mechanical device as noted above.

C. Ductile Iron Pipe

1. See Section 33 10 00 – Water Utilities

3.6 STRUCTURES

A. Precast Concrete Structures

1. Precast Concrete Structure Base

a. Place granular foundation material on excavation subgrade and compact to elevation of outside bottom of structure base.
b. Install precast structure base on foundation material, level to 1/8 inch in five feet.

2. Clean and lubricate structure joints, immediately prior to installation, in accordance with Manufacturer's recommendations.
3. Install precast sections on structure base, plumb to 1/8 inch in five feet.
4. Position each section on previously installed section and push joints tightly together.
5. Position top section on structure as indicated on Drawings or required by job site conditions.
6. Install frame and grate to finished grade, with sewer brick and cement mortar specified.
7. Pipe Connections

a. Seal joints between pipes and structures with brick and cement mortar specified.
b. Neatly cut pipes flush with interior structure walls.

8. Invert Flow Channels

a. Construct invert flow channels smooth and semi-circular in shape.
b. Shape channels with horizontal circular curve radii tangent to incoming pipe (s) and out flowing pipe, as large as structure will permit.
c. Neatly form channels in structure base with sewer brick and cement mortar specified.

3.7 BACKFILL

A. See Section 31 20 00 – Earth Moving.

Bid documents are available only online from eMaryland Marketplace (eMM). Those are the only official documents to be used by Bidders for this Invitation for Bid (IFB). The Bidders shall print on their own stationary the required documents for submitting their bid (as Construction BID Form, Bid Proposal Affidavit, BID Bond, etc.) and submit to the Owner (DPSCS, Division of Capital Construction and Facilities Maintenance) in a sealed envelope which clearly indicates that it contains a sealed bid for this project with the bid due date and the name and address of the Bidder.

Minority Business Enterprises (MBEs) are encouraged to participate and respond to this request for Bid.

CONFORMED DOCUMENT 3 APRIL 2015: This project manual contains sections revised during bidding, and is published for the Contractor's convenience for use during construction. It does not replace the Contract Documents, which comprise the Bid Documents plus revisions issued as Addenda.

Executive Summary

EBA Engineering, Inc. (EBA) was retained by Penza Bailey Architects to perform a Limited Hazardous Materials Survey of the existing structures associated with the planned Youth Detention Center. The property involved in the planned project generally includes a group of connected structures (Dorm Building, Kitchen/Dining Room, Walk-in Refrigeration/Freezer Units, and Roofing Building) referred to as the Dorm Building, portions of the adjoining State Use Industries (SUI) Building, and portions of the grounds associated with these buildings.

The Dorm Building currently houses the Baltimore Pre-Release Unit (BPRU) program. This building is to be razed in association with the planned project. The planned project also includes renovation of the BPRU-occupied portion (i.e., the northern portion) of the SUI Building as well as certain non-BPRU occupied areas in the building. Lastly, portions of the grounds associated with the buildings will be affected by the planned project. The property (buildings and grounds) associated with the planned Youth Detention Center is hereafter collectively referred to as the Subject Property.

More specifically, the Subject Property included the following areas, identified by building.

Dorm Building:

- the interiors of the dormitory structure, the kitchen/dining room, walk-in refrigeration and freezer units, and the Roofing Building (currently used by OSTC for training);
- the exterior walls and roofing system(s) associated with the connected structures comprising the Dorm Building; and
- an area extending approximately 10 feet outward from the exterior walls of the connected structures comprising the Dorm Building.

SUI Building:

- the interior of the BPRU-occupied portion of the building;
- the interior of the Transportation Office;
- the interior of the former Penitentiary Accounting Office (currently occupied by a computer lab);
- the electrical and mechanical rooms located within the basement of the building;
- the exterior walls associated with the BPRU-occupied portion of the building;
- the portion of the roofing system overlying the BPRU-occupied portion of the building; and
- an area extending approximately 10 feet outward from the exterior walls associated with the BPRU-occupied portion of the building.

Floor plans of the surveyed areas notated with EBA-assigned room numbers are included in **Figure 1**. Photographs taken during the survey are included in **Appendix A**.

This Limited Hazardous Materials Survey was performed to identify hazardous materials that may be impacted when demolition and renovation activities occur. The hazardous materials of concern include Asbestos-Containing Building Materials (ACBMs), Lead-Based Paints (LBPs), liquid phase Polychlorinated Biphenyls (PCBs), Ozone-Depleting Compounds (ODCs), Universal Wastes (UW) and Miscellaneous Materials (MM).

The results of the survey, performed on June 16, 2014 through June 25, 2014, have identified hazardous materials at the Subject Property. A quality assurance and quality control (QA/QC) visit was also performed on July 25, 2014 to verify the field findings and collect additional samples where deemed necessary. The following sections summarize EBA's findings.

Asbestos-Containing Building Materials

The results of the survey have identified asbestos-containing building materials at the Subject Property. A summary of the asbestos-containing building materials (material types and quantities) is provided in the following **Table**. The table also contains a column for information indicating whether or not the material is a regulated asbestos-containing material (RACM) per federal regulations.

Quantities of ACBMs			
Material Type	**Quantity**	**Unit of Measure**	**RACM***
Caulk (Multiple Types)	8,775	Linear Feet	No
Sidewalk Expansion Joint (OM14)	125	Linear Feet	No
Transite Window Insert (OM17) (Referred to as "Insulated Wall Panels" on As-Built Drawings)	3,000	Square Feet	No
Window Glaze (Multiple Types)	5,100	Linear Feet	Yes
Plaster Ceiling (S3)	2,650	Square Feet	Yes
Floor Tile (Multiple Types)	35,585	Square Feet	Yes
Floor Tile Mastic (Multiple Types)	41,835	Square Feet	No
Fitting (Multiple Types) (Tested and Presumed)	438	Each	Yes
Joint Compound (DW/JC1)	22,270**	Square Feet	Yes
Spray Applied Column Fireproofing (Presumed)	3,000	Square Feet	Yes
Vibration Dampener (Assumed)	3	Each	No
Fire Door (Assumed)	173	Each	Yes
Valve Packing (Assumed)	21	Each	No
Cement Asbestos Panel Board (Assumed)	1,100	Square Feet	Yes
Built-Up Roofing System (Assumed)	27,000	Square Feet	No
1" Plaster Fireproofing (Presumed)	1,000	Square Feet	Yes
8" Transite Piping (Assumed)	50	Linear Feet	No

Quantities of ACBMs			
Material Type	**Quantity**	**Unit of Measure**	**RACM***
Caulk Between Masonry and Steel (Assumed)	Unknown	Linear Feet	No
Pipe Insulation (Presumed)	2,100	Linear Feet	Yes

*RACM – Regulated Asbestos-Containing Material
**The quantity listed for joint compound is the estimated quantity of drywall observed at the Subject Property, as the joint compound cannot be economically separated from the wall system.

The spray applied fire column fireproofing, illustrated on as-built drawings on vertical columns, was presumed to contain asbestos. This material was presumed to contain asbestos (rather than sampled/tested), as sampling would have required significant disassembly/dismantling of column enclosures to access and collect samples of the suspected material. Further, the 1" plaster fireproofing (illustrated on as-built drawings covering a horizontal beam in the dining room) was presumed to contain asbestos, as it was not identified during the survey but is assumed to be present at the Subject Property.

The fire doors, valve packings, cement asbestos panel boards, and certain caulk (illustrated on as-built drawings at joints between masonry and steel) were assumed to contain asbestos. These materials were assumed to contain asbestos (rather than sampled/tested), as sampling posed safety risks and/or would have required significant disassembly/dismantling of equipment/building components to access and collect samples of the suspect materials. The vibration dampeners and roofing systems were assumed to contain asbestos as sampling would have damaged the materials and affected their integrity. An 8" transite pipe, illustrated on as-built drawings as buried underground, was assumed to contain asbestos as subsurface exploration for hazardous materials was not included in the scope of work for this project.

It may be cost effective to have these materials sampled and analyzed at an appropriate time so that they can be definitively classified as asbestos-containing building materials. The most appropriate time to sample these materials is typically after the project has been turned over to the demolition and renovation contractor, and dismantling for investigative purposes can occur without consideration for damage to equipment/building components.

The EPA requires that regulated asbestos-containing material be removed before demolition and renovation activities begin. Since demolition and renovation is planned for the Subject Property, proposed demolition and renovation techniques are unknown at this time, and recycling of materials may or may not be performed, it is recommended that all ACM be removed to prevent the potential release of fibers.

The OSHA "Asbestos in Construction Standard" (29 CFR 1926.1101) imposes restrictions on the disturbance of asbestos during demolition, remodeling, and renovation activities.

Removal of the following items identified in the building are considered Class I asbestos work by the OSHA regulation:

- Plaster Ceiling (S3)
- 6” Fitting (TSI1)
- 6” Fitting (TSI2)
- 1” Fitting (TSI3)
- ¾“ Fitting (TSI4)
- 4” Fitting (TSI5)
- Spray Applied Column Fireproofing (Assumed)
- 1” Plaster Fireproofing (Assumed)

Removal of the following items identified in the building are considered Class II asbestos work by the OSHA regulation:

- Door/Window Caulk (OM1)
- Door Caulk (OM10)
- Window Caulk (OM11)
- Expansion Joint (OM14)
- Window Caulk (OM16)
- Window Insert (OM17)
- Window Glaze (OM19)
- Window Glaze (OM20)
- Window Caulk (OM21)
- Floor Tile (FT1)
- Floor Tile Mastic (FT1)
- Floor Tile Mastic (FT2)
- Floor Tile Mastic (FT3)
- Floor Tile Mastic (FT4)
- Floor Tile (FT5)
- Floor Tile Mastic (FT5)
- Floor Tile (FT7)
- Floor Tile Mastic (FT7)
- Floor Tile (FT8)
- Floor Tile Mastic (FT8)
- Floor Tile (FT9)
- Floor Tile Mastic (FT9)
- Floor Tile Mastic (FT13)
- Floor Tile (FT14)
- Floor Tile Mastic (FT14)
- Floor Tile (FT15)
- Floor Tile Mastic (FT15)
- Joint Compound (DW/JC1)
- Transite Window Insert (Insulated Wall Panels) (OM17)

- Vibration Dampener (Assumed)
- Fire Door (Assumed)
- Valve Packing (Assumed)
- Cement Asbestos Panel Board (Assumed)
- Built-Up Roof (Assumed)
- 8" Transite Piping (Assumed)
- Caulk Between Masonry and Steel (Assumed)

Class I and Class II asbestos work must be performed by trained employees using work practices required by the OSHA standard.

Lead-Based Paints

Lead-based paints (LBP) were identified throughout the Subject Property atop exterior and interior building components. Specifically, LBP was identified on the following substrate categories: concrete, metal, wood, and vinyl. In addition, lead-containing paints (i.e., paints containing lead but at concentrations less than the threshold for lead-based paint) were identified on various surfaces. The presence of lead in paint in any concentration triggers OSHA regulatory standards (29 CFR 1926.62) and the presence of lead-based paint triggers EPA regulatory standards.

Demolition debris with LBP may be disposed of as non-hazardous provided the material is not classified as a hazardous waste in accordance with 40 CFR Part 261 and SW-846 (Test Methods for Evaluating Solid Waste Physical/Chemical). Metal objects coated with LBP can be recycled.

Liquid Polychlorinated Biphenyls

EBA identified the following types of equipment suspected of containing liquid phase Polychlorinated Biphenyls (PCBs) at the Subject Property.

Quantities for Equipment Containing PCBs		
Equipment Type	**Quantity**	**Unit of Measure**
Ballast	506	Each
Transformer	2	Each

EBA inspected a portion of the light ballasts at the Subject Property. Based on the absence of a "No-PCBs" stamp, EBA identified one type of ballast suspected of containing PCBs. Further, the inspection included only a portion of the ballasts present at the Subject Property, and the uninspected ballasts are also considered to be suspect at this time. An approximate number of suspect ballasts are listed in the previous **Table**.

Ballasts marked as "No PCBs" can be disposed of as non-hazardous waste. Ballasts lacking the "No PCBs" mark should be removed and disposed of in accordance with EPA's Toxic Substances Control Act (TSCA), 40 CFR Part 761. If an unmarked ballast is not leaking, the associated lighting fixture does not require special handling or disposal. If an unmarked ballast is leaking, any material impacted by the leak should be

treated as hazardous waste. Containers storing unmarked ballasts must be labeled in accordance with EPA labeling requirements specified in 40 CFR Part 262 Subpart C.

EBA identified two exterior pad-mounted transformers situated on the southwest corner of the Subject Property adjacent to the west wall of the northern portion of the SUI Building. Both transformers are owned and operated by Baltimore Gas and Electric Company (BGE). The transformers were not labeled with a PCB classification. If the transformers will need to be removed as a result of the demolition and renovation activities, BGE should be contacted to arrange for their removal.

Ozone-Depleting Compounds

EBA identified several types of equipment suspected of containing Ozone-Depleting Compounds (ODCs) at the Subject Property, as identified in the following **Table**.

Quantities for Equipment Containing ODCs		
Equipment Type	**Quantity**	**Unit of Measure**
Water Fountain	4	Each
Ice Machine	2	Each
Commercial Chiller Unit	2	Each
Household Refrigerator / Freezer	5	Each
Window Air Conditioning Unit	23	Each

Under EPA's rule, refrigerant must be recovered from equipment that is typically dismantled on-site before disposal (e.g., retail food refrigeration, central residential air-conditioning, chillers, and industrial process refrigeration) in accordance with the EPA's requirements for servicing.

Equipment that typically enters the waste stream with the charge intact (e.g., motor vehicle air conditioners, household refrigerators, household freezers, and room air conditioners) is subject to special safe disposal requirements. Under the safe disposal requirements, the final person in the disposal chain (e.g., a scrap metal recycler or landfill owner) is responsible for ensuring that refrigerant is recovered from equipment before the final disposal of the equipment. However, persons "upstream" can remove the refrigerant and provide documentation of its removal to the final person if this is more cost-effective. If the final person in the disposal chain (e.g., a scrap metal recycler or landfill owner) accepts appliances that no longer hold a refrigerant charge, that person is responsible for maintaining a signed statement from whom the appliance(s) is being accepted. The signed statement must include the name and address of the person who recovered the refrigerant, and the date that the refrigerant was recovered, or a copy of a contract stating that the refrigerant will be removed prior to delivery.

Universal Wastes

Universal wastes were identified at the Subject Property in the form of 4', 8', and U-shaped fluorescent light tubes, HID bulbs, CFLs, halogen bulbs, a thermostat, and lead-

acid batteries. The types of universal wastes observed and the recorded quantities are provided in the following **Table**.

Quantities for Universal Waste		
Equipment Type	**Quantity**	**Unit of Measure**
4' Fluorescent Tube	1,254	Each
8' Fluorescent Tube	23	Each
U-Shaped Fluorescent Tube	50	Each
HID Bulb	94	Each
CFL Bulb	67	Each
Halogen Bulb	30	Each
Thermostat	1	Each
Lead-Acid Battery	62	Each

All universal waste is to be placed in a container that is structurally sound, will prevent damage to the contents, is compatible with its contents, and will be kept closed at all times (except when adding items to or removing items from the container). The container must be without damage, or evidence of spillage, that could lead to leakage of the waste contained inside. The disposal of hazardous waste is outlined in the EPA regulations in 40 CFR Part 260 and in Maryland regulations in COMAR Title 26, Subtitle 13.

Miscellaneous Materials

EBA identified the following miscellaneous materials at the Subject Property.

Quantities for MMs		
Equipment Type	**Quantity**	**Unit of Measure**
Fire Extinguisher	30	Each
Lead Vent Pipe	5	Each
Generator	1	Each
Aboveground Fuel Storage Tank	1	Each
Underground Fuel StorageTank	2	Each
Underground Automobile Lift / Hydraulic Reservoir(s)	1	2-Post Lift

The fire extinguishers observed within the Subject Property, if permanently removed from service, should be disposed of in accordance with the publication "Guide to the Disposal of Condemned Fire Extinguishers" published by the Fire Extinguishing Trades Association, Fact File No. 108, dated February 2004.

Non-coated/non-painted vent pipes observed on the roof of the Subject Property contain lead. The disposal of these lead-containing items is regulated by the EPA in 40 CFR 261.

An emergency generator with an internal fuel tank was observed at the Subject Property. If the generator is removed from service as part of the planned project it is recommended that the contents of the internal fuel tank be drained, containerized, and

disposed of in accordance with federal and state regulations prior to the removal of the generator.

An aboveground fuel storage tank was observed at the Subject Property. If the tank is removed from service as part of the planned project it is recommended that it be removed in accordance with MDE recommended guidance practices.

An operational underground fuel storage tank was identified at the Subject Property. Further, a historically-operated underground fuel storage tank was identified. Use of the tank was reportedly terminated in the past; however, it is not known if this tank was removed or closed in place. If the operational tank is removed from service as part of the planned project and/or if the historic tank is discovered during demoltion/future development activities, it is recommended that the tank(s) be removed in accordance with federal and state regulations.

A two-post underground automobile lift was illustrated on drawings inside the Roof Building (a former automotive repair garage). EBA could not determine if the lift components and/or possible associated hydraulic reservoirs are still present, and no staff member could provide information related to the lifts. If the lifts and/or any associated hydraulic reservoirs are discovered during demolition/future development activities, it is recommended that these items be removed in accordance with federal and state regulations.

END OF SECTION

1.0 Introduction

Interior and exterior areas of the Subject Property were inspected to identify certain potentially hazardous materials that may be affected by demolition and renovation activities. Specifically, the hazardous materials of concern for this type of project include Asbestos-Containing Building Materials, Lead-Based Paints, Liquid Polychlorinated Biphenyls, Ozone-Depleting Compounds, Universal Wastes, and Miscellaneous Materials.

Floor plans provided to EBA for the Subject Property have been notated with room numbers assigned by EBA during the survey and are included in **Figure 1**. These notated floor plans are used in conjunction with the Hazardous Materials Summary Table provided in **Figure 2** to identify the locations, by room number, of the hazardous materials at the Subject Property. Photographs taken during the survey are included in **Appendix A**.

1.1 Asbestos-Containing Building Materials

Asbestos means the asbestiform varieties of chrysotile, crocidolite, amosite, anthophyllite, tremolite, and actinolite. Asbestos-containing materials (ACM) means any material or product which contains greater than one percent (1%) asbestos. Asbestos-containing building materials (ACBM) means ACM that is found in or on interior structural members or other parts of a building. ACBM is divided into three categories in the EPA regulations (40 CFR Part 763). These categories are thermal system insulation, surfacing materials, and miscellaneous materials. Each category is generally described as follows:

- Thermal System Insulation (TSI) includes those materials applied to pipes, fittings, boilers, breeching tanks, ducts, or other interior/exterior structural components to prevent heat loss or gain, or water condensation, or for other purposes of maintaining temperatures.
- Surfacing (S) Materials include those materials sprayed on, troweled-on, or otherwise applied to surfaces, such as acoustical plaster on ceilings and fireproofing materials on structural members, or other materials on surfaces for acoustical, fireproofing, or other purposes.
- Miscellaneous (M) Materials include interior/exterior building material on structural components, structural members or fixtures, such as roofing, floor and ceiling tiles, caulks, mastics/adhesives, and does not include surfacing material or thermal system insulation.

The EPA requires that Regulated Asbestos-Containing Materials (RACM) be removed before demolition/renovation begins in accordance with the “National Emission Standards for Hazardous Air Pollutants” (NESHAP) 40 CFR Part 61. The State of Maryland also regulates the removal/abatement of asbestos in buildings (COMAR 26.11.21).

RACM includes the following:

- Friable asbestos material;
- Category I non-friable ACM (flooring, asphalt roofing, packings, gaskets) that has become friable;
- Category I non-friable ACM that will be or has been subjected to sanding, grinding, cutting, or abrading; and
- Category II non-friable ACM that has a high probability of becoming or has become crumbled, pulverized, or reduced to powder by the forces expected to act on the material in the course of demolition or renovation operations regulated in 40 CFR 61 Subpart M.

Asbestos is further classified as either 'Friable' or 'Non-Friable'. Friable asbestos material is defined as any material containing more than 1% asbestos that, when dry, can be crumbled, pulverized or reduced to powder by hand pressure. Non-friable asbestos materials are subcategorized as Category I and Category II, where Category I materials include resilient floor covering, asphalt roofing products, packings, and gaskets. Category II materials include all other non-friable asbestos-containing materials.

1.2 Lead-Based Paints

The Maryland Department of the Environment (MDE) definition of lead-based paint (LBP) is used as the basis for this screening. Lead-based paint is defined as paint or coating that contains lead at a concentration greater than 0.7 milligrams per square centimeter, as determined by an X-Ray Fluorescence (XRF) instrument.

XRF is a common quantitative analytical technique used to measure the concentration of elements in solid or liquid materials. In this technique, the sample is bombarded by some form of ionizing radiation such as X-rays, or gamma-rays, which can cause the atoms of the sample to emit characteristic X-rays. These characteristic X-rays from the sample, known as the fluorescent X-rays, can be detected and analyzed to provide information as to what concentration of atoms are contained in the sample. Since this technique does not harm the sample in any way, it is considered a nondestructive testing technique.

Lead-based paint is also defined by the MDE as paint chips containing greater than 0.5% lead by weight, as determined through laboratory analysis (Method SW846-7420). Since removal of paint chips from the substrate are required, this method is considered a destructive testing technique.

1.3 Liquid Polychlorinated Biphenyls

Polychlorinated Biphenyls (PCBs) are mixtures of synthetic organic chemicals with the same basic chemical structure and similar physical properties ranging from oily liquids to waxy solids. They are produced by attaching one or more chlorine atoms to a

biphenyl molecule. Due to their non-flammability, chemical stability, high boiling point and electrical insulating properties, PCBs were used in hundreds of industrial and commercial applications including electrical, heat transfer, and hydraulic equipment; as plasticizers in paints, plastics and rubber products; in pigments, dyes and carbonless copy paper; and in many other applications. More than 1.5 billion pounds of PCBs were manufactured in the United States prior to cessation of production in 1977 (EPA, 2005).

Concern over the toxicity and occurrence in the environment of PCBs led Congress in 1976 to enact §6(e) of the Toxic Substances Control Act (TSCA) that included among other things, prohibitions on the manufacture, processing, and distribution in commerce of PCBs. Thus, TSCA legislated true "cradle to grave" (i.e., from manufacture to disposal) management of PCBs in the United States (EPA, 2005).

PCB content has been categorized into three classifications by the federal government. Electrical equipment that contains less than 50 parts per million (ppm) of PCBs is defined as non-PCB. Electrical equipment that contains between 50 ppm and less than 500 ppm of PCBs is defined as PCB-contaminated. Electrical equipment with a PCB content of 500 ppm and greater is classified as PCB.

PCBs were commonly sold in the United States of America under the trade name "Arocolor." However, companies that used PCBs in the manufacture of transformers and capacitors often used other trade names. According to the EPA, electrical light ballasts manufactured prior to July 1978 have a greater than 50% chance of containing PCBs at concentrations of 50 ppm or greater. Ballasts manufactured after July 1978 are required to bear a “No PCB” label indicating they do not contain PCBs.

This study did not include inspection or testing for non-liquid PCBs.

1.4 Ozone-Depleting Compounds

Ozone-depleting compounds (ODCs) are generally small organic molecules (less than three carbons) that contain chlorine, fluorine, or bromine. Some uses of ODCs include refrigerants, fire suppressants, and cleaning compounds. Title VI of the United States Clean Air Act Amendments (CAA) of 1990 has classified ozone-depleting substances as belonging to Class I substances (most harmful) or Class II substances (less harmful).

Class I substances are those with an ozone-depletion potential of 0.2 or higher. Class I substances identified in Title VI are chlorofluorocarbons (CFCs), halons, carbon tetrachloride and 1,1,1-trichloroethane (methyl chloroform). These chlorine-based chemicals account for about 80 percent of ozone depletion.

Class II substances are those with an ozone-depletion potential less than 0.2. Currently, all of the hydro chlorofluorocarbons (HCFCs), which are replacing the more harmful ozone-depleting compounds, are listed as Class II substances.

Effective July 1, 1992, Section 608 of the CAA prohibits individuals from knowingly venting ozone-depleting compounds (generally CFCs and HCFCs) used as refrigerants into the atmosphere while maintaining, servicing, repairing, or disposing of air-conditioning or refrigeration equipment.

1.5 Universal Wastes

A universal waste is a common product/material, found in considerable quantities, that exhibits low-level hazards. Universal wastes include batteries, pesticides, mercury-containing equipment, and bulbs/lamps. All universal waste must be handled in a way as to prevent the release of the hazardous substance into the environment, contained in a secure manor, labeled, and safely transported to a destination facility. Definitions of universal waste are detailed in 40 CFR 273.9, and general descriptions of universal wastes are provided as follows.

A battery is an electrochemical cell that receives, stores, and delivers electric energy. Batteries can be disassembled into cells before removal and transportation as described in 40 CFR 273.13 (small quantity handlers) and 40 CFR 273.33 (large quantity handlers).

In general, there are several types of batteries, including primary and secondary. Primary batteries are most common in households and are known as single-use batteries. Primary batteries automatically convert chemical energy into electrical energy using zinc and manganese chemistry. Secondary batteries are known as re-chargeable batteries. Recharging occurs when electrical current is applied to the battery, reversing the chemical reaction that occurs during battery use. Secondary batteries are usually composed of nickel cadmium, nickel metal hydride or lithium ion chemistry. Lead-acid batteries are the oldest type of the secondary batteries and are typically used to power vehicles.

Pesticides include any substance/chemical designed to control and manage pests.

Mercury-containing equipment includes a device or part of a device (including thermostats, but excluding batteries and bulbs/lamps) that contains elemental mercury integral to its function. Thermostats are typically used to control a heating or cooling system. A thermostat is an electro-mechanical on/off switch that is activated by temperature changes. The sensing element is usually a spiral bimetallic strip that coils and uncoils in response to temperature changes because of differential expansion of the two bonded metals. In a mercury-switch thermostat, a ball of mercury rolls between contacts in one or more sealed glass ampoules, which are attached to a metal strip. The switch works when the mercury makes or breaks an electrical circuit, which creates a signal for heating or cooling from a furnace or central air conditioning system. Each glass ampoule contains approximately three grams of mercury, which is approximately the size of a dime. Mercury's unique properties, high conductivity, high surface tension and liquidity at room temperature, have made it a useful component in many electric switches.

A bulb/lamp, also referred to as a universal waste lamp, is the bulb or tube portion of an electric lighting device specifically designed to produce radiant energy. Examples of common universal waste lamps include, but are not limited to, fluorescent, high intensity discharge, neon, mercury vapor, high pressure sodium, and metal halide lamps.

1.6 Miscellaneous Materials

Other hazardous materials that may be present include fuels and hazardous substances stored in aboveground and underground storage tanks, pressurized cylinders, paints, lubricants, degreasers, cleaning compounds, and other potentially hazardous materials in quantities greater than 5-gallons.

1.7 Limitations and Exclusions

The following limitations and exclusions apply to this project:

- Interior areas within the OSTC-occupied portion of the SUI building that will be affected by the installation of new fire alarms were not surveyed and included under this cover.
- Areas above and behind fixed substrates (e.g., plaster, drywall, masonry block, concrete, etc.) were not accessed as the survey was limited to non-intrusive measures due to the occupied nature of the property.
- Sampling of energized components was not performed due to risk of electrical hazards.
- Sampling of roofing systems was not conducted in order to avoid damage to the systems.
- Quantities of hazardous materials identified herein are approximate at the time of this report. Quantities may change in the future due to daily operations at the Subject Property.
- The conclusions presented in this report are based on the visual findings observed on the dates of the survey.
- Subsurface investigation/exploratory measures were not included in the scope of work for this project.
- One room was inaccessible during the survey. The room has been excluded from the findings and is listed as room number 107 in **Figure 1**.

END OF SECTION

2.0 Asbestos-Containing Building Materials

The National Emission Standard for Hazardous Air Pollutants (NESHAP) requires the building owner/operator to perform an asbestos inspection of affected portions of the facility prior to demolition and renovation activities.

Asbestos Hazard Emergency Response Act (AHERA) accredited Asbestos Inspectors performed an asbestos inspection of accessible interior and exterior portions of the Subject Property. Certificates of the inspectors are included in **Appendix B.**

2.1 Inspection and Analytical Methodology

The inspection consisted of performing a records review followed by an investigation to identify suspect asbestos-containing building materials (ACBM) in accessible building areas. The inspection was non-intrusive (i.e., the inspection did not include accessing areas behind walls, above hard ceilings, below hard floors, or behind other hard substrate).

2.1.1 Records Review

A records review consists of reviewing previous asbestos inspection/survey reports, abatement records and/or site drawings, if available, associated with the facility.

2.1.2 On-site Investigation

The on-site investigation involved a combination of visual assessments and minimally destructive sampling methodologies. Visual assessments primarily focused on identifying suspect materials to be assessed during the survey. Sampling was only conducted where suspect ACBM was identified. Where possible, samples were collected from inconspicuous locations. Samples from suspect friable materials were patched in a manner to limit the release of potential asbestos fibers; however, these locations were not permanently repaired.

2.1.3 Sample Collection and Analysis

EBA collected samples of materials that were suspected of containing asbestos in accordance with the Asbestos Hazard Emergency Response Act (AHERA) (40 CFR 763 Subpart E). All areas of surfacing materials, thermal system insulation materials, or miscellaneous materials that were uniform in color and texture were grouped into homogeneous areas and sampled according to the AHERA asbestos sampling protocol as shown in the following **Table**.

Table – AHERA Asbestos Sampling Protocol Per Category		
Surfacing Materials	**Thermal System Insulation**	**Miscellaneous Materials**
3 samples per area ≤ 1,000 ft²	3 samples for each TSI material	Sample in a manner sufficient to determine (Note – EBA's Standard Operating Procedure is to collect at least 2 samples per homogenous area)
5 samples per area > 1,000 ft² but ≤ 5,000 ft²	1 sample per area of patched insulation (<6 linear or square feet)	
7 samples per area > 5,000 ft²	Sample in a manner sufficient per mechanical system not assumed to be ACBM where cement or plaster is used on fittings such as tees, elbows, or valves	

Samples were submitted to AMA Analytical Services, Inc. (AMA) for analysis by Polarized Light Microscopy (PLM) in accordance with the EPA Method for the Determination of Bulk Asbestos Samples (EPA 600M4-82-020). In the event sample results were reported as "trace" by the PLM method, further analysis would be performed by Transmission Electron Microscopy (TEM). AMA is accredited by the National Voluntary Laboratory Accreditation Program (NVLAP) for the analysis of bulk asbestos by PLM and bulk asbestos by TEM.

2.2 Results

2.2.1 Records Review

The following drawings were made available by Penza Bailey Architects for review.

- Central Office and Storage Building for the State use Industries at the Maryland Penitentiary, Office of John A. Ahlers, Project No. K-611, January 1964 (SUI Building)
    - The following components listed on the drawings within the limits of planned renovation were/are suspect asbestos-containing building materials.
        - Vinyl Asbestos (Floor)
        - Asphalt Tile (Floor)
        - White Plaster (Ceiling)
        - Sand Finished Plaster (Ceiling)
        - Acoustical Plaster (Ceiling)
        - Caulk Joints Between Masonry and Steel
        - 2” Fire Proofing Cover on Beams
        - 8” Transite Pipe Run
- Vocational Rehabilitation Center, Maryland Penitentiary, Wrenn, Lewis and Jencks Architects, Project No. K-611-685, June 1969 (Dorm Building)
    - The following components listed on the drawings were/are suspect asbestos-containing building materials.

- Vinyl Asbestos Tile Treads and Risers
- Insulated Wall Panels (Exterior Walls Above and Under Windows)
- Cement Asbestos Panel Board
- Resilient Tile
- Suspended Acoustical Tile
- Caulk
- Built-Up Roof
- 1" Plaster Fireproofing

- Conversion of Central Office to Work Release Housing, Lapicki-Smith, Project No. K-611-751-(3), May 1977 (Dorm Building and SUI Building)

  - The following components listed on the drawings within the limits of planned renovation were/are suspect asbestos-containing building materials.

    - Fireproofing on Columns
    - Plaster on Columns

- Occupational Skills Training Center, Gaudreau, Inc., Project No. ED-000-881-001, February 1991 (SUI Building)

  - No suspect asbestos-containing building materials were identified within the limits of the planned renovation during the review of these drawings.

Appendix C includes portions of the drawings referencing the suspect asbestos-containing building materials. Where observed and accessible, the suspect materials identified on the drawings were inspected and sampled. If the materials were not accessible or were not observed due to obstructions, they were treated as assumed or presumed asbestos-containing building materials.

2.2.2 On-site Investigation and Sampling Results

As a result of the inspection, suspect ACBMs were identified within the Subject Property. Samples of suspect materials were collected and analyzed by a certified laboratory. As a result of the sampling and laboratory analysis, ACBMs were identified and are provided in the following **Table**. The table also contains a column for information indicating whether or not the material is a regulated asbestos-containing material (RACM) per federal regulations.

*Category: S=Surfacing; M=Miscellaneous; TSI=Thermal System Insulation

Representative photographs of the ACBM are included in **Appendix A**. AMA's asbestos laboratory analytical results and a listing of all samples collected at the Subject Property are included in **Appendix D**. Floor plans provided for this project have been notated with room numbers assigned by EBA during the survey and are included in **Figure 1**. These notated floor plans are used in conjunction with the Hazardous Materials Summary Table provided in **Figure 2** to identify the locations, by room number, of all asbestos-containing building materials (as well as other hazardous materials) at the Subject Property.

2.2.3 Presumed Asbestos-Containing Materials

Presumed Asbestos-Containing Materials (PACM) as defined by OSHA include thermal system insulation and surfacing material found in a building constructed no later than 1980. Certain suspect building materials identified during the survey could not be sampled and were presumed to contain asbestos, as sampling would have required significant disassembly/dismantling of building components, as the materials could not be safely accessed, or the material was not identified during the survey but was illustrated on as-built drawings.

The following specific types of building materials were not sampled and are presumed to contain asbestos:

- Spray Applied Column Fireproofing (fireproofing on steel columns in the Dorm and SUI Buildings) (material could not be accessed without significant damage to column enclosures)
- 1" Plaster Fire Proofing (plaster enclosure around steel beams in the Dorm Building) (material was not visually observed, but was illustrated on as-built drawings)
- Pipe Insulation and Pipe Fittings (in crawl space in Dorm Building)(all areas not accessed due to safety hazards)

Quantities and locations of the presumed asbestos-containing building materials are provided in the Hazardous Materials Summary Table in **Figure 2**.

2.2.4 Assumed Asbestos-Containing Building Materials

Assumed ACM includes any material that is suspected to contain asbestos and that was not sampled. Certain suspect building materials identified during the survey could not be sampled; these materials included fire doors, valve packings, cement asbestos panel boards, and caulk (illustrated on as-built drawings at joints between masonry and steel). These materials were assumed to contain asbestos (rather than sampled/tested), as sampling posed safety risks and/or would have required significant disassembly/dismantling of equipment/components to access and collect samples of the suspect materials. The vibration dampeners and roofing systems were assumed to contain asbestos as sampling would have damaged the materials and affected their functionality. An 8" transite pipe, illustrated on as-built drawings as buried underground, was assumed to contain asbestos as subsurface exploration for hazardous materials was not included in the scope of work for this project.

The following specific types of building materials could not be sampled and were assumed to contain asbestos:

- Vibration Dampener
- Fire Door
- Valve Packing

- Cement Asbestos Panel Board (part of roofing system)
- Built-Up Roofing System
- 8" Transite Pipe (underground)

Quantities and locations of assumed asbestos-containing building materials are provided in the Hazardous Materials Summary Table in **Figure 2**.

2.2.5 Homogeneous Areas Documented as Non Asbestos-Containing

The following homogeneous areas were documented as non asbestos-containing based upon laboratory analysis of samples collected during the survey:

- Bathroom Caulk, White (OM2)
- Stair Tread, Black (OM4)
- Sink Caulk, White (OM5)
- Wall Adhesive, Brown (OM7)
- Ductwork Mastic, Gold (OM9)
- Window Glaze, Off-White (OM12)
- Joint Caulk, White (OM13)
- Window Caulk, White/Gray (OM15)
- Window Glaze, Black (OM18)
- Ductwork Mastic, Off-White (OM22)
- Tile Adhesive, Brown (OM23)
- Ceiling Tile (2'x4'), Thin Worming and Pinholes, White (DCT1)
- Ceiling Tile (2'x4'), Pinholes with a Small Amount of Worming, White (DCT2)
- Ceiling Tile (2'x4'), Wide Worming and Pinholes, White (DCT3)
- Ceiling Tile (2'x4'), Long and Multiple Types of Worming, White (DCT4)
- Ceiling Tile (2'x4'), Large and Small Pinholes, White (DCT5)
- Cove Base, Black (CB1)
- Cove Base Mastic, Brown, Associated with CB1
- Cove Base, Gray (CB2)
- Cove Base Mastic, Cream, Associated with CB2
- Cove Base, Black (CB3)
- Cove Base Mastic, Cream, Associated with CB3
- Cove Base, Blue (CB4)
- Cove Base Mastic, Brown, Associated with CB4
- Cove Base, Brown (CB5)
- Cove Base Mastic, Brown, Associated with CB5
- Plaster Ceiling, White (S1)
- Plaster Ceiling/Wall, White (S2) (including plaster column enclosures, referred to on as-built drawings as "extended plaster enclosure")
- Base Coat Ceiling/Wall, Brown (S2)
- Base Coat Ceiling, Brown (S3)

- Spray Applied Fire Proofing, White (S5) (referred to on as-built drawings as " 2" fire proof cover on beams ")
- Gypsum-Fiber Roofing Material, White (S6)
- Drywall, White (DW/JC1)
- Floor Tile, 12"X12", Cream w/Multicolor Streaks (FT2)
- Floor Tile, 12"X12", Cream w/White Specs (FT3)
- Floor Tile, 12"X12", Cream w/Black Specs (FT4)
- Floor Tile, 12"X12", White/Cream w/Blue Streaks (FT6)
- Floor Tile Mastic, Black (Associated with FT6)
- Floor Tile, 12"X12", Black and White Speckle (FT10)
- Floor Tile Mastic, Black (Associated with FT10)
- Floor Tile, 12"X12", Gray w/Dark Gray Blotches (FT11)
- Floor Tile Mastic, Black (Associated with FT11)
- Floor Tile, 12"X12", Slate Blue w/White Streaks (FT12)
- Floor Tile Mastic, Black (Associated with FT12)
- Floor Tile, 12"X12", Light Gray w/Accent (FT13)
- 1 ½" Pipe Insulation, Steam Condensate Pipe Run, White (TSI6)
- 4" Pipe Insulation, Low Pressure Steam Pipe Run, White (TSI7)
- Miscellaneous Fitting (1"-2"), Heat Return Pipe Run, White (TSI8)

2.2.6 Quantities for ACBM

Quantities for ACBMs identified are listed by material type in the following **Table**. The locations as well as the quantities of ACBMs within the limits of the Subject Property are provided in the Hazardous Materials Summary Table in **Figure 2**.

Quantities of ACBMs		
Material Type	**Quantity**	**Unit of Measure**
Caulk (Multiple Types)	8,775	Linear Feet
Sidewalk Expansion Joint (OM14)	125	Linear Feet
Transite Window Insert (OM17) (Referred to on As-Built Drawings as "Insulated Wall Panels")	3,000	Square Feet
Window Glaze (Multiple Types)	5,100	Linear Feet
Plaster Ceiling (S3)	2,650	Square Feet
Floor Tile (Multiple Types)	35,585	Square Feet
Floor Tile Mastic (Multiple Types)	41,835	Square Feet
Fitting (Multiple Types) (Tested and Presumed)	438	Each
Joint Compound (DW/JC1)	22,270*	Square Feet
Spray Applied Column Fireproofing (Assumed)	3,000	Square Feet
Vibration Dampener (Assumed)	3	Each
Fire Door (Assumed)	173	Each
Valve Packing (Assumed)	21	Each
Cement Asbestos Panel Board (Assumed)	1,100	Square Feet

Quantities of ACBMs		
Material Type	**Quantity**	**Unit of Measure**
Built-Up Roofing System (Assumed)	27,000	Square Feet
1” Plaster Fireproofing (Assumed)	1,000	Square Feet
8” Transite Piping (Assumed)	50	Linear Feet
Caulk Between Masonry and Steel (Assumed)	Unknown	Linear Feet
Pipe Insulation (Presumed)	2,100	Linear Feet

*****The quantity listed for joint compound is the estimated quantity of drywall observed at the Subject Property, as the joint compound cannot be economically separated from the wall system.

END OF SECTION

3.0 Lead-Based Paints

A Lead-Based Paint (LBP) Inspector as certified through the Maryland Department of the Environment (MDE), performed a LBP inspection of accessible interior and exterior portions of the Subject Property. A certificate of the inspector is included in **Appendix E.**

3.1 Inspection and Analytical Methodology

EBA performed a limited (screening) survey to identify locations of LBP that may be disturbed by renovation and demolition activities. The survey was intended to determine:

- Whether lead-based paint is present at the Subject Property including the exterior surfaces; and,
- If lead is present, which building components contain lead-based paint?

Building areas and components that appear to have a similar painting history and substrate were grouped together for screening/sampling purposes. This survey was not intended to be a comprehensive surface-by-surface inspection (i.e., HUD level inspection) of the Subject Property, nor is a survey of that type necessary or required for this type of project. The inspection consisted of areas that were readily accessible.

Interior walls throughout the buildings were identified with letters A, B, C, and D. For the purpose of this report, the inspector opted to designate wall A as the wall which encompasses the main entrance door to the specific room/space; subsequent walls follow in a sequential clockwise pattern around the room.

Exterior walls throughout the buildings were also identified with letters A, B, C, and D. For the purposes of this report, the inspector opted to designate wall A as the wall that faces north; subsequent walls follow in a sequential clockwise pattern around the buildings.

3.1.1 Records Review

A records review consists of reviewing previous lead inspection reports, abatement records and/or site drawings, if available, associated with the facility.

3.1.2 XRF Instrumentation

Direct reading X-Ray Fluorescence (XRF) instrumentation was used to identify LBP. Specifically, the Niton Data Transfer instrument manufactured by Thermo Electron, Corp. was utilized for the limited survey. Surface coatings were considered LBP if the XRF result exceeds the State of Maryland definition of LBP of 0.7 milligrams of lead per square centimeter (> 0.7mg/cm^2). An XRF performance characteristic sheet is included

in **Appendix F**. The performance characteristic sheet specifies calibration tolerances, XRF indices for positive, negative, and inconclusive results, and modes of operation.

3.1.3 Paint Chip Analysis

Lead-based paint is also defined by the MDE as paint chips containing greater than 0.5% lead by weight, as determined through laboratory analysis (Method SW846-7420). Paint chip samples are typically collected and analyzed in the event that readings from the XRF are reported as inconclusive. Paint chip samples are also collected in the event there is limited access to or irregularly-shaped surfaces of the substrate.

3.2 Results

3.2.1 Records Review

The following drawings were made available by Penza Bailey Architects for review.

- Central Office and Storage Building for the State use Industries at the Maryland Penitentiary, Office of John A. Ahlers, Project No. K-611, January 1964 (SUI Building)
- Vocational Rehabilitation Center, Maryland Penitentiary, Wrenn, Lewis and Jencks Architects, Project No. K-611-685, June 1969 (Dorm Building)
- Conversion of Central Office to Work Release Housing, Lapicki-Smith, Project No. K-611-751-(3), May 1977 (Dorm Building and SUI Building)
- Occupational Skills Training Center, Gaudreau, Inc., Project No. ED-000-881-001, February 1991 (SUI Building)

No coatings notated as LBPs were identified within the limits of the Subject Property during the review of these drawings.

3.2.2 XRF Results

Lead-based paints were detected at the Subject Property by use of an XRF during the survey as identified in the following **Table**. A complete list of XRF readings is included in **Appendix G**.

Components with Lead-Based Paint (> 0.7 mg/cm^2)						
Reading No.	**Component**	**Member**	**Substrate**	**Color**	**Location (EBA Room No.)**	**Result (mg/cm^2)**
106	Railing	Post	Metal	Gray	23	4.4
107	Railing	Post	Metal	Gray	23	2.4
112	Valve	2”	Metal	Red	23	18.6
113	Valve	2”	Metal	Red	23	20
114	Valve	2”	Metal	Red	23	16
168	Wall	Sink	Metal	White	133	24.2
233	Window	Frame	Wood	Gray	59	1.3
298	Wall	NA	Concrete	Gray	48	1.3

Components with Lead-Based Paint (> 0.7 mg/cm^2)						
Reading No.	**Component**	**Member**	**Substrate**	**Color**	**Location (EBA Room No.)**	**Result (mg/cm^2)**
299	Wall	NA	Concrete	Gray	48	1.5
300	Wall	NA	Concrete	Gray	48	1.4
332	Baseboard	NA	Vinyl	White	89	2.7
333	Baseboard	NA	Vinyl	White	89	3.2
337	Baseboard	NA	Vinyl	White	89	1.4
357	Wall	NA	Concrete	Grey	69	2.1
360	Wall	NA	Concrete	Grey	69	2.3
384	Piping	4”	Metal	Green	Exterior	12.6

Lead-containing paints (paints containing lead but at concentrations less than the threshold for lead-based paint) were also identified on various surfaces tested within the Subject Property and are identified in the XRF data included in **Appendix G**.

Representative photographs of the LBP are included in **Appendix A**. The XRF data from all tested surfaces is included in **Appendix G**.

3.2.3 Paint Chip Analysis

No paint chip samples were collected during the survey.

END OF SECTION

4.0 Liquid Polychlorinated Biphenyls

The on-site inspectors investigated the Subject Property for equipment containing liquid phase PCBs during the survey.

4.1 Inspection and Analytical Methodology

The Subject Property was inspected for equipment that may contain liquid phase PCBs. Such equipment commonly includes light ballasts located within fluorescent light fixtures, electrical transformers, and hydraulic equipment. No laboratory analysis was performed in association with the inspection for suspect PCB-containing equipment. Inspection for materials/items containing non-liquid PCBs was not included in this survey.

4.1.1 Records Review

A records review consists of reviewing previous PCB-containing equipment inspection reports, abatement records, and/or site drawings, if available, associated with the facility.

4.1.2 On-site Investigation

The on-site investigation involved a visual assessment of suspect equipment that may contain PCBs. If required, EBA performed limited dismantling of the equipment in an attempt to visually confirm the presence or absence of oil suspected of containing PCBs. Representative (≈5% of total) fluorescent light fixtures were disassembled and the associated light ballasts were inspected for labels indicating PCB content.

4.1.3 Manufacturer and Utility Review

If the presence or absence of PCBs in suspect equipment could not be confirmed in the field, EBA conducted additional research by contacting the manufacturer and/or utility provider in order to obtain information on the suspect equipment. It should be noted that the manufacturer was not contacted for every piece of suspect equipment present at the Subject Property, as certain types of equipment were present in voluminous quantities (e.g., light ballasts).

4.2 Results

4.2.1 Records Review

The following drawings were made available by Penza Bailey Architects for review.

- Central Office and Storage Building for the State use Industries at the Maryland Penitentiary, Office of John A. Ahlers, Project No. K-611, January 1964 (SUI Building)
- Vocational Rehabilitation Center, Maryland Penitentiary, Wrenn, Lewis and Jencks Architects, Project No. K-611-685, June 1969 (Dorm Building)
- Conversion of Central Office to Work Release Housing, Lapicki-Smith, Project No. K-611-751-(3), May 1977 (Dorm Building and SUI Building)
- Occupational Skills Training Center, Gaudreau, Inc., Project No. ED-000-881-001, February 1991 (SUI Building)

No equipment notated as containing PCBs was identified within the limited of the Subject Property during the review of these drawings.

4.2.2 On-site Investigation

EBA identified light ballasts suspected of containing liquid phase PCBs at the Subject Property. Ballasts lacking a "No PCB" stamp are presumed to contain liquid PCBs. An approximate number of ballasts observed within the Subject Property are listed in the **Table** as follows.

Lighting Ballast Quantity and Type					
Manufacturer	**Cat. No.**	**"No-PCB" Label (Y/N)**	**Quantity Observed**	**Location (EBA Room No.)**	**Unit of Measure**
Advance	VEL-4P32-SC	Y	5	49, 92	Each
Advance	ICN-4P32-SC	Y	3	73	Each
Advance	ICN-2S86	Y	2	83	Each
Advance	V-2S40-1-TP	Y	2	91A	Each
General Electric	**GE-432MAX-N/Ultra**	**N**	**1**	**70**	**Each**
Triad	B232IUNVHP-B	Y	4	89	Each
Triad	B232I277RH-A	Y	5	67, 70	Each
Ulra-Miser	E232PI277G01	Y	2	90	Each
Universal	749-L-S-TC-P	Y	3	47	Each
Unknown	**Unknown**	**Unknown**	**505**	**Throughout**	**Each**

EBA identified other equipment suspected of containing liquid phase PCBs. The equipment included the following.

- Two exterior pad-mounted transformers were observed situated on the southwest corner of the Subject Property, adjacent to the west wall of the northern portion of the SUI Building. Both transformers are owned and operated by Baltimore Gas and Electric Company (BGE). The transformers were not labeled with a PCB classification. If the transformers will need to be removed as a result of the demolition and renovation activities, BGE should be contacted to arrange for their removal.

- One interior pad-mounted three-phase transformer manufactured by Siemens Energy and Automation, Inc. (Siemens) was observed in the basement of a mechanical space in the SUI Building (identified with catalog no. 3F3Y150). The

unit was not labeled as a dry-type transformer. A follow-up with the manufacturer was performed and is discussed in **Section 4.2.3**.

During the survey, EBA identified other types of equipment that could potentially contain fluids and PCBs. However, based on the results of the inspection, the equipment was determined not to contain fluids and/or PCBs. This equipment included the following.

- One interior pad-mounted three-phase transformer manufactured by Siemens Energy and Automation, Inc. (Siemens) was observed in the basement of the Dorm Building with catalog no. 3F3Y030ST. The unit was labeled as a dry-type transformer.

- One interior pad-mounted three-phase transformer manufactured by Siemens Energy and Automation, Inc. (Siemens) was observed in the SUI Building with catalog no. 3F3Y045ST. The unit was labeled as a dry-type transformer.

- One interior pad-mounted three-phase transformer manufactured by Federal Pacific Electrical Company (Federal Pacific) was observed in the Dorm Building with serial no. 20279-019. The unit was labeled as a dry-type transformer.

Representative photographs of the equipment determined to be suspect PCB-containing as a result of inspection and/or manufacturer's review (refer to following section) are included in **Appendix A**.

4.2.3 Manufacturer Review

Siemens' website (www.usa.siemens.com) was used to investigate if the transformer with catalog no. 3F3Y150 contains PCBs. The website listed the unit as a dry-type transformer; therefore, the unit would not contain fluids, or PCBs.

4.2.4 Quantities for Liquid PCBs

Quantities for PCBs are listed by equipment type in the following **Table**. The locations as well as the quantities of suspect PCBs within the limits of the Subject Property are provided in the Hazardous Materials Summary Table in **Figure 2**.

Quantities for PCBs		
Equipment Type	**Quantity**	**Unit of Measure**
Ballast	506	Each
Transformer	2	Each

END OF SECTION

5.0 Ozone-Depleting Compounds

The on-site inspectors investigated the Subject Property for equipment historically known to contain Ozone-Depleting Compounds (ODCs) during the survey. ODCs contain molecules of chlorine, fluorine, or bromine. Title VI of the United States Clean Air Act Amendments (CAA) of 1990 has defined ozone-depleting substances as belonging to Class I (most harmful) and Class II (less harmful).

5.1 Inspection and Analytical Methodology

The Subject Property was inspected for historically known types of equipment containing ODCs. Such equipment commonly includes chlorofluorocarbons (CFCs) within refrigerators, window air-conditioning units, water fountains, and chillers. No laboratory analysis was performed in association with the inspection for equipment containing ODCs.

5.1.1 Records Review

A records review consists of reviewing previous inspection reports, abatement records and/or site drawings, if available, associated with the facility.

5.1.2 On-site Investigation

The on-site investigation involved a visual assessment of suspect equipment that could contain ODCs. If required, EBA performed limited dismantling of equipment that was not currently in operation in an attempt to visually confirm the presence or absence of ODCs.

5.1.3 Manufacturer and Utility Review

If the presence or absence of ODCs in suspect equipment could not be confirmed in the field, EBA conducted additional research by contacting the manufacturer in order to obtain information on the suspect equipment.

5.2 Results

5.2.1 Records Review

The following drawings were made available by Penza Bailey Architects for review.

- Central Office and Storage Building for the State use Industries at the Maryland Penitentiary, Office of John A. Ahlers, Project No. K-611, January 1964 (SUI Building)
- Vocational Rehabilitation Center, Maryland Penitentiary, Wrenn, Lewis and Jencks Architects, Project No. K-611-685, June 1969 (Dorm Building)

- Conversion of Central Office to Work Release Housing, Lapicki-Smith, Project No. K-611-751-(3), May 1977 (Dorm Building and SUI Building)
- Occupational Skills Training Center, Gaudreau, Inc., Project No. ED-000-881-001, February 1991 (SUI Building)

No equipment notated as containing ODCs was identified within the limits of the Subject Property during the review of these drawings.

5.2.2 On-site Investigation

Suspect equipment that may contain ODCs was identified at the Subject Property in the following forms:

- Water Fountain Units – Four (4)
- Ice Machine Units – Two (2)
- Commercial Chiller Units – Two (2)
- Household Refrigerator/Freezer Units – Five (5)
- Air Conditioning (A/C) Units – Twenty-three (23)

Based upon the working condition of the identified equipment, it is anticipated that these units still contain ozone-depleting compounds. These refrigerants have low ozone depletion potential.

Representative photographs of ODCs are included in **Appendix A**

5.2.3 Manufacturer Review

Equipment suspected of containing ODCs were identified; however, contact with the manufacturer was not considered necessary.

5.2.4 Quantities for Ozone-Depleting Compounds

Quantities for equipment containing ODCs are listed by equipment type in the following **Table**. The locations as well as the quantities of ODCs within the limits of the Subject Property are provided in the Hazardous Materials Summary Table in **Figure 2**.

Quantities for Equipment Containing ODCs		
Equipment Type	**Quantity**	**Unit of Measure**
Water Fountain	4	Each
Ice Machine	2	Each
Commercial Chiller Unit	2	Each
Household Refrigerator / Freezer	5	Each
Window Air Conditioning Unit	23	Each

END OF SECTION

6.0 Universal Wastes

The on-site inspectors investigated the Subject Property for items classified as Universal Wastes (UW) during the survey.

6.1 Inspection and Analytical Methodology

The Subject Property was inspected for equipment and items classified as UW. Such equipment commonly includes batteries, pesticides, mercury-containing equipment, and bulbs/lamps. No laboratory analysis was performed in association with the inspection for Universal Wastes.

6.1.1 Records Review

Records review consists of reviewing previous UW inspection reports, abatement records and/or site drawings, if available, associated with the facility.

6.1.2 On-site Investigation

The on-site investigation involved a visual assessment that focused on identifying UW at the Subject Property. EBA performed limited dismantling of suspect equipment in an attempt to visually confirm the presence or absence of a UW.

6.1.3 Manufacturer Review

If the presence or absence of UW (e.g., the presence or absence of mercury in equipment) could not be confirmed in the field, EBA conducted additional research by contacting the manufacturer and obtaining information on the suspect equipment.

6.2 Results

6.2.1 Records Review

The following drawings were made available by Penza Bailey Architects for review.

- Central Office and Storage Building for the State use Industries at the Maryland Penitentiary, Office of John A. Ahlers, Project No. K-611, January 1964 (SUI Building)
- Vocational Rehabilitation Center, Maryland Penitentiary, Wrenn, Lewis and Jencks Architects, Project No. K-611-685, June 1969 (Dorm Building)
- Conversion of Central Office to Work Release Housing, Lapicki-Smith, Project No. K-611-751-(3), May 1977 (Dorm Building and SUI Building)
- Occupational Skills Training Center, Gaudreau, Inc., Project No. ED-000-881-001, February 1991 (SUI Building)

Universal wastes were not notated within the limits of the Subject Property during the review of these drawings.

6.2.2 On-site Investigation

The results of the on-site investigation confirmed the presence of UW at the Subject Property in the following forms:

- Light Tubes – Light fixtures were observed to contain 4', 8', and U-shaped fluorescent tubes.
- Light Bulbs – Light fixtures were observed to contain high-intensity discharge bulbs (HID), compact florescent light bulbs (CFLs), and halogen bulbs.
- Mercury-Containing Thermostat – A thermostat manufactured by Honeywell was partially disassembled by EBA and revealed components that contained mercury.
- Lead-Acid Batteries – Batteries were identified in emergency backup lighting systems and an emergency backup phone system.

During the survey, EBA identified additional thermostats that could potentially contain mercury. However, based on the results of the inspection, the thermostats were determined not to contain mercury. These thermostats are listed as follows by manufacturer.

- Johnson Controls, Inc.
- White-Rodgers
- Honeywell

Representative photographs of UW are included in **Appendix A**.

6.2.3 Manufacturer Review

Universal Waste was identified at the Subject Property; however, contact with the manufacturer was not necessary.

6.2.4 Quantities for Universal Waste

Quantities for UW are listed by equipment type in the following **Table**. The locations as well as the quantities of UW within the limits of the Subject Property are provided in the Hazardous Materials Summary Table in **Figure 2**.

Estimated Quantities for Universal Waste		
Equipment Type	**Quantity**	**Unit of Measure**
4’ Fluorescent Tube	1,254	Each
8’ Fluorescent Tube	23	Each
U-Shaped Fluorescent Tube	50	Each
HID Bulb	94	Each
CFL Bulb	67	Each
Halogen Bulb	30	Each
Thermostat	1	Each
Lead-Acid Battery	62	Each

END OF SECTION

7.0 Miscellaneous Materials

The on-site inspectors investigated the Subject Property for other potentially hazardous or regulated items/materials, referred to as Miscellaneous Materials (MM), during the survey.

7.1 Inspection and Analytical Methodology

The Subject Property was inspected for items/materials that may be hazardous but do not necessarily fit into prior classifications, and for items/materials that may be non-hazardous but are regulated if the item/material is removed or becomes a waste. Such items/materials include aboveground and underground storage tanks and their contents, pressurized cylinders, and containers of paints, lubricants, degreasers and other potentially hazardous liquid/solid materials in quantities greater than 5-gallons. No laboratory analysis was performed in association with the identification and documentation of such items/materials.

7.1.1 Records Review

A records review consists of reviewing previous inspection reports, abatement records and/or site drawings, if available, associated with the facility.

7.1.2 On-site Investigation

The on-site investigation involved a visual assessment that focused on identifying items/materials of concern that do not necessarily fit into prior classifications described previously in this report.

7.1.3 Manufacturer Review

If the hazardous nature of suspect items/materials could not be determined in the field, EBA conducted additional research by contacting the manufacturer and obtaining information on the suspect items/materials.

7.2 Results

7.2.1 Records Review

The following drawings were made available by Penza Bailey Architects for review.

- Central Office and Storage Building for the State use Industries at the Maryland Penitentiary, Office of John A. Ahlers, Project No. K-611, January 1964 (SUI Building)
- Vocational Rehabilitation Center, Maryland Penitentiary, Wrenn, Lewis and Jencks Architects, Project No. K-611-685, June 1969 (Dorm Building)

- Conversion of Central Office to Work Release Housing, Lapicki-Smith, Project No. K-611-751-(3), May 1977 (Dorm Building and SUI Building)
- Occupational Skills Training Center, Gaudreau, Inc., Project No. ED-000-881-001, February 1991 (SUI Building)

During the review of these drawings, a gasoline underground storage tank and associated gas pump was identified within relatively close proximity to the northwestern corner of the Roofing Building (formerly a garage for auto repair) associated with the Dorm Building. The size of the tank was not indicated on the plans. Limited information regarding this tank was obtained from on-site personnel. Reportedly, the tank was decommissioned approximately ten years ago, under the supervision of an unspecified regulatory agency. It is unknown if the decommissioning process involved removal of the tank or closure in-place.

In addition, an underground storage tank was identified on certain drawings in the grass-covered area near the northwest portion of the SUI Building. According to on-site personnel the tank is 5,000-gallons in size and contains heating oil.

Further, a two-post underground automobile lift was illustrated on certain drawings inside the garage. EBA could not determine if the lift components and/or possible associated hydraulic reservoirs are still present, and no staff member could provide information related to the lifts.

Appendix C includes a portion of the drawings referencing the underground storage tanks.

7.2.2 On-site Investigation

Other potentially hazardous or regulated items/materials were observed during the survey and were present in the following forms:

- Pressurized Cylinders
    - Thirty (30) fire extinguishers
- Lead Component Materials
    - Five (5) rooftop lead vent pipes
- Generator
    - One (1) Kohler diesel generator
- Aboveground Storage Tank
    - One (1) diesel storage tank (500-gallon)

- Underground Storage Tanks

  - One (1) 5,000-gallons underground storage tank (described in Section 7.2.1)
  - One (1) former pump island (for the historic gasoline tank (size unknown) described in Section 7.2.1)

- Underground Automobile Lift/Hydraulic Reservoir(s)

  - Metal plates/covers (in approximate areas of automotive lift illustrated on drawings)

Representative photographs of other potentially hazardous or regulated items/materials observed during the survey are included in **Appendix A**.

7.2.3 Manufacturer Review

Items/materials exhibiting other hazardous or regulated characteristics were observed at the Subject Property; however, contact with the manufacturer was not considered necessary.

7.2.4 Quantities for Miscellaneous Materials

Quantities for Miscellaneous Materials are listed by material type in the following **Table**. The locations as well as the quantities of Miscellaneous Materials within the limits of the Subject Property are provided in the Hazardous Materials Summary Table in **Figure 2**.

Estimated Quantities for Miscellaneous Materials		
Equipment Type	**Quantity**	**Unit of Measure**
Fire Extinguisher	30	Each
Lead Vent Pipe	5	Each
Generator	1	Each
500-Gallon Diesel Aboveground Storage Tank	1	Each
5,000-Gallon Heating Oil Underground Storage Tank	1	Each
Unknown-sized Gasoline Underground Storage Tank	1	Each
Underground Automobile Lift / Hydraulic Reservoir(s)	1	2-Post Lift

END OF SECTION

8.0 Conclusions/Recommendations

The results of the survey have identified hazardous materials within the limits of the Subject Property. The disturbance of these hazardous materials during demolition and renovation activities will trigger Federal, State, and Local regulations.

8.1 Asbestos-Containing Building Materials

The results of the survey have identified asbestos-containing building materials (ACBM) in the following categories.

- Surfacing Materials
    - Plaster Ceiling (S3)
    - Spray Applied Column Fireproofing (Presumed)
    - 1” Plaster Fireproofing (Presumed)
- Thermal System Insulation
    - 6” Fitting (TSI1)
    - 6” Fitting (TSI2)
    - 1” Fitting (TSI3)
    - ¾” Fitting (TSI4)
    - 4” Fitting (TSI5)
- Miscellaneous Materials
    - Friable
        - Window Glaze (OM19)
        - Window Glaze (OM20)
    - Category I Non-Friable
        - Floor Tile (FT1)
        - Floor Tile Mastic (FT1)
        - Floor Tile Mastic (FT2)
        - Floor Tile Mastic (FT3)
        - Floor Tile Mastic (FT4)
        - Floor Tile (FT5)
        - Floor Tile Mastic (FT5)
        - Floor Tile (FT7)
        - Floor Tile Mastic (FT7)
        - Floor Tile (FT8)
        - Floor Tile Mastic (FT8)
        - Floor Tile (FT9)

- Floor Tile Mastic (FT9)
- Floor Tile Mastic (FT13)
- Floor Tile (FT14)
- Floor Tile Mastic (FT14)
- Floor Tile (FT15)
- Floor Tile Mastic (FT15)
- Valve Packings (Assumed)
- Built-Up Roofing (Assumed)

➢ Category II Non-Friable

- Door/Window Caulk (OM1)
- Door Caulk (OM10)
- Window Caulk (OM11)
- Expansion Joint (OM14)
- Window Caulk (OM16)
- Window Insert (OM17)
- Window Caulk (OM21)
- Joint Compound (DW/JC1)
- Transite Window Insert (OM17) (Insulated Wall Panels)
- Vibration Dampener (Assumed)
- Fire Door (Assumed)
- Cement Asbestos Panel (Assumed)
- 8” Transite Piping (Assumed)
- Caulk Between Masonry and Steel (Assumed)

The spray applied fire column fireproofing, illustrated on as-built drawings on vertical columns, was presumed to contain asbestos. This material was presumed to contain asbestos (rather than sampled/tested), as sampling would have required significant disassembly/dismantling of column enclosures to access and collect samples of the suspected material. Further, the 1” plaster fireproofing (illustrated on as-built drawings covering a horizontal beam in the dining room) was presumed to contain asbestos, as it was not identified during the survey but is assumed to be present at the Subject Property.

The fire doors, valve packings, cement asbestos panel boards, and caulk (illustrated on as-built drawings at joints between masonry and steel) were assumed to contain asbestos. These materials were assumed to contain asbestos (rather than sampled/tested), as sampling posed safety risks and/or would have required significant disassembly/dismantling of equipment/components to access and collect samples of the suspect materials. The vibration dampeners and roofing systems were assumed to contain asbestos as sampling would have damaged the materials and affected their functionality. An 8” transite pipe, illustrated on as-built drawings as buried underground, was assumed to contain asbestos as subsurface exploration for hazardous materials was not included in the scope of work for this project.

It may be cost effective to have these materials sampled and analyzed at an appropriate time so that they can be definitively classified as asbestos-containing building materials. The most appropriate time to sample these materials is typically after the project has been turned over to the demolition and renovation contractor, and dismantling for investigative purposes can occur without consideration for damage to equipment/building components.

The EPA requires that regulated asbestos-containing material be removed before demolition and renovation activities begin. Since demolition and renovation is planned for the Subject Property, proposed demolition and renovation techniques are unknown at this time, and recycling of materials may or may not be performed, it is recommended that all ACM be removed to prevent the potential release of fibers.

The OSHA "Asbestos in Construction Standard" (29 CFR 1926.1101) imposes restrictions on the disturbance of asbestos during demolition, remodeling, and renovation activities.

Removal of the following items identified in the building are considered Class I asbestos work by the OSHA regulation:

- Plaster Ceiling (S3)
- 6" Fitting (TSI1)
- 6" Fitting (TSI2)
- 1" Fitting (TSI3)
- ¾" Fitting (TSI4)
- 4" Fitting (TSI5)
- Spray Applied Column Fireproofing (Presumed)
- 1" Plaster Fireproofing (Presumed)

Removal of the following items identified in the building are considered Class II asbestos work by the OSHA regulation:

- Door/Window Caulk (OM1)
- Door Caulk (OM10)
- Window Caulk (OM11)
- Expansion Joint (OM14)
- Window Caulk (OM16)
- Window Insert (OM17)
- Window Glaze (OM19)
- Window Glaze (OM20)
- Window Caulk (OM21)
- Floor Tile (FT1)
- Floor Tile Mastic (FT1)
- Floor Tile Mastic (FT2)
- Floor Tile Mastic (FT3)

- Floor Tile Mastic (FT4)
- Floor Tile (FT5)
- Floor Tile Mastic (FT5)
- Floor Tile (FT7)
- Floor Tile Mastic (FT7)
- Floor Tile (FT8)
- Floor Tile Mastic (FT8)
- Floor Tile (FT9)
- Floor Tile Mastic (FT9)
- Floor Tile Mastic (FT13)
- Floor Tile (FT14)
- Floor Tile Mastic (FT14)
- Floor Tile (FT15)
- Floor Tile Mastic (FT15)
- Joint Compound (DW/JC1)
- Transite Window Insert (OM17)(Insulated Wall Panels)
- Vibration Dampeners (Assumed)
- Fire Door (Assumed)
- Valve Packing (Assumed)
- Cement Asbestos Panel (Assumed)
- Built-Up Roof (Assumed)
- 8” Transite Piping (Assumed)
- Caulk Between Masonry and Steel (Assumed)

Class I and Class II asbestos work must be performed by trained employees using work practices required by the OSHA standard.

8.2 Lead-Based Paints

Lead-based paints (LBP) were identified throughout the Subject Property. In addition, lead-containing paints were identified on various surfaces. If disturbed, the presence of lead in paint in any concentration triggers OSHA regulatory standards and the presence of lead-based paint triggers EPA regulatory standards.

Demolition debris with LBP may be disposed of as non-hazardous provided the material is not classified as a hazardous waste in accordance with 40 CFR Part 261 and SW-846 (Test Methods for Evaluating Solid Waste Physical/Chemical). Metal objects coated with LBP can be recycled.

8.3 Liquid Polychlorinated Biphenyls

Suspect Liquid Polychlorinated Biphenyl (PCB) containing equipment was identified in the form of light ballasts and two transformers owned by BGE.

EBA identified one type of ballast suspected of containing PCBs. Further, since our inspection included only a portion of the ballasts present at the Subject Property, the uninspected ballasts are also considered to be suspect at this time.

Ballasts marked as “No PCBs” can be disposed of as non-hazardous waste. Ballasts lacking the “No PCBs” mark should be removed and disposed of in accordance with EPA’s Toxic Substances Control Act (TSCA), 40 CFR Part 761. If an unmarked ballast is not leaking, the associated lighting fixture does not require special handling or disposal. If an unmarked ballast is leaking, any material impacted by the leak should be treated as hazardous waste. Containers storing unmarked ballasts must be labeled in accordance with EPA labeling requirements specified in 40 CFR Part 262 Subpart C.

EBA identified two exterior pad-mounted transformers situated on the southwest corner of the Subject Property, adjacent to the west wall of the northern portion of the SUI Building. Both transformers are owned and operated by Baltimore Gas and Electric Company (BGE). The transformers were not labeled with a PCB classification. If the transformers will need to be removed as a result of the demolition and renovation activities, BGE should be contacted to arrange for their removal.

8.4 Ozone-Depleting Compounds

Ozone-depleting compounds were identified in the form of water fountains, ice machines, commercial chiller units, household refrigerator/freezer units, and window air conditioning units.

Under EPA's rule, refrigerant must be recovered from equipment that is typically dismantled on-site before disposal (e.g., retail food refrigeration, central residential air-conditioning, chillers, and industrial process refrigeration) in accordance with the EPA's requirements for servicing.

Equipment that typically enters the waste stream with the charge intact (e.g., motor vehicle air conditioners, household refrigerators, household freezers, and room air conditioners) is subject to special safe disposal requirements. Under the safe disposal requirements, the final person in the disposal chain (e.g., a scrap metal recycler or landfill owner) is responsible for ensuring that refrigerant is recovered from equipment before the final disposal of the equipment. However, persons "upstream" can remove the refrigerant and provide documentation of its removal to the final person if this is more cost-effective. If the final person in the disposal chain (e.g., a scrap metal recycler or landfill owner) accepts appliances that no longer hold a refrigerant charge, that person is responsible for maintaining a signed statement from whom the appliance(s) is being accepted. The signed statement must include the name and address of the person who recovered the refrigerant, and the date that the refrigerant was recovered, or a copy of a contract stating that the refrigerant will be removed prior to delivery.

8.5 Universal Wastes

EBA identified universal wastes within the Subject Property in the form of 4', 8', and u-shaped fluorescent light tubes, HID bulbs, CFLs, halogen bulbs, a thermostat, and lead-acid batteries.

All universal waste is to be placed in a container that is structurally sound, will prevent damage to the contents, is compatible with its contents, and will be kept closed at all times (except when adding items to or removing items from the container). The container must be without damage, or evidence of spillage, that could lead to leakage of the waste contained inside. The disposal of hazardous waste is outlined in the EPA regulations in 40 CFR Part 260 and in Maryland regulations in COMAR Title 26, Subtitle 13.

8.6 Miscellaneous Materials

Other items/materials that are potentially hazardous or regulated were observed at the Subject Property. These items/materials and EBA's conclusions and recommendations are provided as follows.

The fire extinguishers observed within the Subject Property, if permanently removed from service, should be disposed of in accordance with the publication "Guide to the Disposal of Condemned Fire Extinguishers" published by the Fire Extinguishing Trades Association, Fact File No. 108, dated February 2004.

Non-coated/non-painted vent pipes observed on the roof of the Subject Property contain lead. The disposal of these lead-containing items is regulated by the EPA in 40 CFR 261.

An emergency generator with an internal fuel tank was observed at the Subject Property. If the generator is removed from service as part of the planned project it is recommended that the contents of the internal fuel tank be drained, containerized, and disposed of in accordance with federal and state regulations prior to the removal of the generator.

A diesel aboveground storage tank was observed at the Subject Property. If the tank is removed from service as part of the planned project it is recommended that it be removed in accordance with MDE recommended guidance practices.

An operational heating oil underground storage tank was identified at the Subject Property. Further, a historically-operated gasoline underground storage tank was identified. Use of the tank was reportedly terminated in the past; however, it is not known if this tank was removed or closed in place. If the operational tank is removed from service as part of the planned project and/or if the historic tank is discovered during demoltion/future development activities, it is recommended that the tank(s) be removed in accordance with federal and state regulations.

A two-post underground automobile lift was illustrated on drawings inside the Roof Building (a former automotive repair garage). EBA could not determine if the lift components and/or possible associated hydraulic reservoirs are still present, and no staff member could provide information related to the lifts. If the lifts and/or any associated hydraulic reservoirs are discovered during demolition/future development activities, it is recommended that these items be removed in accordance with federal and state regulations.

Summary of Polarized Light Microscopy

AMA Sample Number	Client Sample #	Total Asbestos	Chrysotile Percent	Amosite Percent	Crocidolite Percent	Other Asbestos Percent	Mineral Wool Percent	Fiberglass Percent	Organic Percent	Synthetic Percent	Other Percent	Particulate Percent	Sample Type	Sample Color	Homogeneity	Analyst ID	Comments

The following footnotes only apply to those samples which the total asbestos result is flagged with a note number.

1 TEM RECOMMENDATION - Please note, due to resolution limitations with optical microscopy and/or interference from matrix components of this sample, results which are reported via PLM as negative or trace (<1%) for asbestos may contain a significant quantity of asbestos. It is recommended that the additional analytical technique of TEM be used to check for asbestos fibers below the resolution limits of optical microscopy.

2 MATRIX REDUCTION RECOMMENDATION - Please note, due to interference from the matrix components of this sample, results which are reported via PLM as negative or trace (<1%) for asbestos may contain a significant quantity of asbestos which is obscured from view. It is recommended that the additional preparation technique of gravimetric reduction be performed on this sample to minimize the obscuring effects of matrix components, followed by reanalysis by PLM and/or TEM.

Analysis Method - EPA/600/R-93/116 dated July 1993

NAD = "No Asbestos Detected" TR = "Trace equals less than 1% of this component"

Uncertainty: For samples containing asbestos in range of 1-10% the CV is 0.43, 11-35% CV=0.55, >35 CV=0.23

All results are to be considered preliminary and subject to change unless signed by the Technical Director or Deputy.

Technical Director Peerawut Chaikeenee **Analyst(s)** P. Chaikeenee / S. Watson

PLEASE ANALYZE ALL LAYERS OF EACH SAMPLE

Homogeneous area = Suspect Materials of one type and color

Samples required for the following:
TSI: 3 samples for each TSI material; 1 sample per area of patched insulation (<6 linear or squared feet); Sample in a manner sufficient per mechanical system not assumed to be ACBM where cement or plaster is used on fittings such as tees, elbows, or valves.
Surfacing: 3 samples per area < 1,000 ft2; 5 samples per area > 1,000 ft2; 7 samples per area > 5,000 ft2.
Miscellaneous: Sample in a manner sufficient to determine (Note EBA's Standard Operating Procedure is to collect at least 2 samples per homogenous area).

TSI = Thermal System Insulation
S = Surface Material
M = any other building material or structural component

The following footnotes only apply to those samples which the total asbestos result is flagged with a note number.

1 TEM RECOMMENDATION - Please note, due to resolution limitations with optical microscopy and/or interference from matrix components of this sample, results which are reported via PLM as negative or trace (<1%) for asbestos may contain a significant quantity of asbestos. It is recommended that the additional analytical technique of TEM be used to check for asbestos fibers below the resolution limits of optical microscopy.

2 MATRIX REDUCTION RECOMMENDATION - Please note, due to interference from the matrix components of this sample, results which are reported via PLM as negative or trace (<1%) for asbestos may contain a significant quantity of asbestos which is obscured from view. It is recommended that the additional preparation technique of gravimetric reduction be performed on this sample to minimize the obscuring effects of matrix components, followed by reanalysis by PLM and/or TEM.

Analysis Method - EPA/600/R-93/116 dated July 1993

NAD = "No Asbestos Detected" TR = "Trace equals less than 1% of this component"

Uncertainty: For samples containing asbestos in range of 1-10% the CV is 0.43, 11-35% CV=0.55, >35 CV=0.23

All results are to be considered preliminary and subject to change unless signed by the Technical Director or Deputy.

Technical Director Peerawut Chaikeenee **Analyst(s)** Peerawut Chaikeenee

EBA Engineering Asbestos Sample Data Sheet

Project Name:	Youth Detention Center Project	Inspector(s):	Sylvan Burch
Project Location:	926 Greenmount Avenue, Baltimore, Maryland 21202	Project Manager:	Sherri Waldron
Project Number:	3532-01-000	Date Sampled:	7/25/2014

PLEASE ANALYZE ALL LAYERS OF EACH SAMPLE

Sample Number or ID	Material Description (Use FT-Floor Tile, CT-Ceiling Tile, PF-Pipe Fitting)	Color	Sample Location (Floor, Room)	ACBM Type (TSI or S or M)	Condition (G, F, or P)	Multiple Layers

3532-7-25-152						

PLEASE ANALYZE ALL LAYERS OF EACH SAMPLE

Homogeneous area = Suspect Materials of one type and color

Samples required for the following:
TSI: 3 samples for each TSI material; 1 sample per area of patched insulation (<6 linear or squared feet); Sample in a manner sufficient per mechanical system not assumed to be ACBM where cement or plaster is used on fittings such as tees, elbows, or valves.
Surfacing: 3 samples per area < 1,000 ft2; 5 samples per area > 1,000 ft2; 7 samples per area > 5,000 ft2.
Miscellaneous: Sample in a manner sufficient to determine (Note EBA's Standard Operating Procedure is to collect at least 2 samples per homogenous area).

TSI = Thermal System Insulation
S = Surface Material
M = any other building material or structural component

Appendix E – Certificate of LBP Inspector

THIS IS TO CERTIFY THAT

Sylvan Bonsignore Burch

HAS MET THE LEAD PAINT SERVICES ACCREDITATION REQUIREMENTS FOR

Risk Assessor

EXPIRATION DATE 04 / 04 / 2016

TRAINING PROVIDER Aerosol Monitoring & Analysis, Inc.

ADMINISTRATOR, LEAD PAINT ACCREDITATION
MARYLAND DEPARTMENT OF THE ENVIRONMENT

DATE 4/4/14

COURSE DATE 12 / 12 / 2013

STATE OF MARYLAND

Certificate # 14463

Application for reaccreditation shall be submitted to MDE 60 days prior to accreditation expiration indicated on this certificate.

Appendix F – XRF Performance Characteristic Sheet

Performance Characteristic Sheet

EFFECTIVE DATE: **September 24, 2004** **EDITION NO.: 1**

MANUFACTURER AND MODEL:

Make: *Niton LLC*
Tested Model: *XLp 300*
Source: ^{109}Cd
Note: This PCS is also applicable to the equivalent model variations indicated below, for the Lead-in-Paint K+L variable reading time mode, in the XLi and XLp series:

XLi 300A, XLi 301A, XLi 302A and XLi 303A.
XLp 300A, XLp 301A, XLp 302A and XLp 303A.
XLi 700A, XLi 701A, XLi 702A and XLi 703A.
XLp 700A, XLp 701A, XLp 702A, and XLp 703A.

Note: The XLi and XLp versions refer to the shape of the handle part of the instrument. The differences in the model numbers reflect other modes available, in addition to Lead-in-Paint modes. The manufacturer states that specifications for these instruments are identical for the source, detector, and detector electronics relative to the Lead-in-Paint mode.

FIELD OPERATION GUIDANCE

OPERATING PARAMETERS:

Lead-in-Paint K+L variable reading time mode.

XRF CALIBRATION CHECK LIMITS:

0.8 to 1.2 mg/cm^2 (inclusive)

The calibration of the XRF instrument should be checked using the paint film nearest 1.0 mg/cm^2 in the NIST Standard Reference Material (SRM) used (e.g., for NIST SRM 2579, use the 1.02 mg/cm^2 film).

If readings are outside the acceptable calibration check range, follow the manufacturer's instructions to bring the instruments into control before XRF testing proceeds.

SUBSTRATE CORRECTION:

For XRF results using Lead-in-Paint K+L variable reading time mode, substrate correction is <u>not</u> needed for:

Brick, Concrete, Drywall, Metal, Plaster, and Wood

INCONCLUSIVE RANGE OR THRESHOLD:

K+L MODE READING DESCRIPTION	SUBSTRATE	THRESHOLD (mg/cm^2)
Results not corrected for substrate bias on any substrate	Brick	1.0
	Concrete	1.0
	Drywall	1.0
	Metal	1.0
	Plaster	1.0
	Wood	1.0

BACKGROUND INFORMATION

EVALUATION DATA SOURCE AND DATE:

This sheet is supplemental information to be used in conjunction with Chapter 7 of the HUD *Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing* ("HUD Guidelines"). Performance parameters shown on this sheet are calculated from the EPA/HUD evaluation using archived building components. Testing was conducted in August 2004 on 133 testing combinations. The instruments that were used to perform the testing had new sources; one instrument's was installed in November 2003 with 40 mCi initial strength, and the other's was installed June 2004 with 40 mCi initial strength.

OPERATING PARAMETERS:

Performance parameters shown in this sheet are applicable only when properly operating the instrument using the manufacturer's instructions and procedures described in Chapter 7 of the HUD Guidelines.

SUBSTRATE CORRECTION VALUE COMPUTATION:

Substrate correction is not needed for brick, concrete, drywall, metal, plaster or wood when using Lead-in-Paint K+L variable reading time mode, the normal operating mode for these instruments. If substrate correction is desired, refer to Chapter 7 of the HUD Guidelines for guidance on correcting XRF results for substrate bias.

EVALUATING THE QUALITY OF XRF TESTING:

Randomly select ten testing combinations for retesting from each house or from two randomly selected units in multifamily housing. Use the K+L variable time mode readings.

Conduct XRF retesting at the ten testing combinations selected for retesting.

Determine if the XRF testing in the units or house passed or failed the test by applying the steps below.

Compute the Retest Tolerance Limit by the following steps:

Determine XRF results for the original and retest XRF readings. Do not correct the original or retest results for substrate bias. In single-family housing a result is defined as the average of three readings. In multifamily housing, a result is a single reading. Therefore, there will be ten original and ten retest XRF results for each house or for the two selected units.

Calculate the average of the original XRF result and retest XRF result for each testing combination.

Square the average for each testing combination.

Add the ten squared averages together. Call this quantity C.

Multiply the number C by 0.0072. Call this quantity D.

Add the number 0.032 to D. Call this quantity E.

Take the square root of E. Call this quantity F.

Multiply F by 1.645. The result is the Retest Tolerance Limit.

Compute the average of all ten original XRF results.

Compute the average of all ten re-test XRF results.

Find the absolute difference of the two averages.

If the difference is less than the Retest Tolerance Limit, the inspection has passed the retest. If the difference of the overall averages equals or exceeds the Retest Tolerance Limit, this procedure should be repeated with ten new testing combinations. If the difference of the overall averages is equal to or greater than the Retest Tolerance Limit a second time, then the inspection should be considered deficient.

Use of this procedure is estimated to produce a spurious result approximately 1% of the time. That is, results of this procedure will call for further examination when no examination is warranted in approximately 1 out of 100 dwelling units tested.

TESTING TIMES:

For the Lead-in-Paint K+L variable reading time mode, the instrument continues to read until it is moved away from the testing surface, terminated by the user, or the instrument software indicates the reading is complete. The following table provides testing time information for this testing mode. The times have been adjusted for source decay, normalized to the initial source strengths as noted above. Source strength and type of substrate will affect actual testing times. At the time of testing, the instruments had source strengths of 26.6 and 36.6 mCi.

Testing Times Using K+L Reading Mode (Seconds)

	All Data			Median for laboratory-measured lead levels (mg/cm^2)		
Substrate	25^{th} Percentile	Median	75^{th} Percentile	Pb < 0.25	0.25 ≤ Pb<1.0	1.0 ≤ Pb
Wood Drywall	4	11	19	11	15	11
Metal	4	12	18	9	12	14
Brick Concrete Plaster	8	16	22	15	18	16

CLASSIFICATION RESULTS:

XRF results are classified as positive if they are greater than or equal to the threshold, and negative if they are less than the threshold.

DOCUMENTATION:

A document titled *Methodology for XRF Performance Characteristic Sheets* provides an explanation of the statistical methodology used to construct the data in the sheets, and provides empirical results from using the recommended inconclusive ranges or thresholds for specific XRF instruments. For a copy of this document call the National Lead Information Center Clearinghouse at 1-800-424-LEAD.

This XRF Performance Characteristic Sheet was developed by the Midwest Research Institute (MRI) and QuanTech, Inc., under a contract between MRI and the XRF manufacturer. HUD has determined that the information provided here is acceptable when used as guidance in conjunction with Chapter 7, Lead-Based Paint Inspection, of HUD's *Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing*.
